A. As well as California junctions. We likewise have through connections through the Ogden and Salt Lake gateways, at Pueblo and Denver, and likewise we accept traffic from our connections at Kansas City and move through to Chicago or deliver th[e] traffic at Chicago to eastern connections on a through schedule.

Q. From your knowledge will you say whether or not lines paralleling or competing with the Sante Fe give expedited movement to empty refrigerators during the busy season in the same fashion that you have described for the Santa Fe?

A. Yes, sir, I understand, in fact when we are called upon to assist them in expediting the return of their cars we do that on our lines and turn those cars over at the various gateways to other western connections that perform the same service.

[fol. 1845] Q. Do you travel over the lines of the Santa Fe frequently?

A. Quite often.

Q. About how much of your time on the average is now spent away from the office and out on the lines?

A. That will vary from I would say year to year, but I would say forty per cent of my time is away from the office. Sometimes it will be more, sometimes less.

Q. In prior years has it reached any higher percentage?

A. Yes, when I was assistant to the general superintendent of transportation and served in that capacity for approximately twelve years, my time out on the railroad would be 90 per cent of my total time.

Q. What means of transportation do you use in traveling over the Santa Fe?

A. In my present capacity I use a business car.

Q. Do you always use passenger trains?

A. No, sir.

Q. You sometimes have the business car attached to freight trains?

A. Yes, sir, I do.

Q. Where do you put it in the freight train?

[fol. 1846]. A. It is the rear car following the caboose.

Q. You don't spot it next to the locomotive?

A. No. I have made one or two trips where I have told the conductor to pick me up next to the engine and set me out because I was going to make a short jump, rather than have to cut the engine off and run around the train and take a little more time setting the car off the train under that method and I would tell him to handle me next to the engine.

Q. Is it correct that generally your business car is at the rear end of the train?

A. Yes, in the majority of the cases.

Q. Do you make any selection of freight trains according to length upon which you will travel with your business car?

A. No.

Q. Do you ever travel with your business car on trains of more than 70 cars?

A. Yes, quite often.

Q. Are you familiar with the box and refrigerator car equipment owned or operated by the Sante Fe on its lines?

A. Yes, sir.

Q. Is that a necessary part of your duties?

A. Yes, it is.

[fol. 1847] Q. Your experience with the Santa Fe as I recall runs back to 1912?

A. Yes, sir.

Q. You are familiar I take it with the Santa Fe equipment from and since 1912?

A. I am.

Q. I will ask you to look at defendant's exhibit No. 2 showing the chronology of freight boxcars of Southern Pacific ownership up to 1940, since 1900. Have you seen that exhibit?

A. Yes, I have seen this exhibit and I have compared our car construction with this exhibit.

Q. Addressing particularly to the period since 1912 down to date, will you say whether or not the development of Santa Fe boxcar equipment has proceeded generally along

substantially the same lines as indicated by exhibit No. 2?

A. It has.

Q. Does the Santa Fe now operate any cars not of steel or steel underframe construction in main line revenue service?

A. No, sir.

Q. That is of its own ownership?

A. That is right.

Q. Does the Santa Fe operate a particular type of car in [fol. 1848] refrigerator car service of its own ownership?

A. Yes, we have our own ownership of refrigerator cars.

Q. How are they designated by initial?

A. S. F. R. D.

Q. Were you present in the courtroom when Mr. Cartmill of the Pacific Fruit Express Company testified?

A. I was.

Q. Have you seen a copy of his exhibit No. 135?

A. Yes, I have a copy of it.

Q. Showing the development of P. F. E. car construction. Do your S. F. R. D. cars resemble the Pacific Fruit Express cars to any degree?

A. They are almost identical and there is a reason for that due to the fact that both the P. F. E. Company and the Santa Fe in the construction of their refrigerator cars endeavored to build the cars according to the request or desires of our perishable industry in California and Arizona in order that they may, if they wish, load the containers in the cars with the least amount of bulk-heading or dunnage, so to speak, that is, gates in the center of the car to brace the loads. The citrus industry can load a load of citrus in either a P. F. E. car or an S. F. R. D. car with [fol. 1849] not some particle of bracing other than the slats between the loads. I think that also applies to the grape industry. The lugs of grapes will fit into the inside dimensions of either car without practically any dunnage what not other than the strips between the layers.

Q. Are the inside measurements of your cars adjusted for this purpose or designed for that purpose?

A. Yes, the inside dimensions of the S. F. R. D. car is 33 feet, 1½ inches, in length. Some are 33 feet, 2⅝ inches. The width is 8 feet, 2 inches wide, and the height varies from about 7 feet, 1 inch from the floor rack to the roof to 7 feet, 7 inches, from the floor to the roof. That might

not be just exactly the inches, the fractions of inches, but that is approximately the inside dimensions of our car.

Q. Do the P. F. E. cars move over Santa Fe lines from time to time?

A. Yes, sir.

Q. With the same type of freight as carried in the S. F. R. D.'s?

A. Yes, sir.

Q. Do the S. F. R. D. cars move over the Southern Pacific from time to time?

[fol. 1850] A. Yes, sir.

Q. Have you seen a copy of defendant's exhibit No. 4 showing the chronology of passenger coach and chair car design of Southern Pacific Company passenger carrying cars?

A. Yes, sir, I have reviewed that.

Q. Are you familiar with passenger cars of the Sante Fe?

A. Yes, sir.

Q. Referring to exhibit No. 4 will you say whether or not the development of Santa Fe passenger cars has proceeded along substantially the same lines as are indicated by exhibit No. 4?

A. They have.

Q. Does your company operate these lightweight streamline units, not necessarily the articulated but the other single unit types?

A. Yes.

Q. In regular revenue passenger service?

A. Yes.

Q. Do you have in main line passenger service any passenger-carrying cars not of steel construction?

A. No, we do not, that is, the steel underframe. We have some cars with the steel underframe with wood bodies that [fol. 1851] we still operate on some of our branch line trains but in our main line passenger trains, we do not.

Q. I will ask you to refer to defendant's exhibits Nos. 5 and 6 which relate to the development of locomotives. Referring first to the chronology of freight locomotives shown on exhibit No. 5, will you say whether or not the Santa Fe has had in the past or now has freight locomotives similar in design and tractive effort to those indicated by that exhibit?

A. We do, with one exception. We do not have the AC type. Our heaviest locomotive is the Mountain type, the 2-10-2.

Q. Sometimes called the "Santa Fe" type?

A. Referred to as the Santa Fe type.

Q. Do you have a locomotive of the 2-10-4 wheel arrangement?

A. Yes, we do.

Q. What is the tractive effort of the 2-10-4's?

A. The 2-10-4 Santa Fe type, 93,000 is the tractive effort and the weight on drivers, 371,000; the 2-10-2's which operate in mountain territory, the tractive effort is 85,360, weight on drivers, 320,000 pounds. Those are the heaviest locomotives that we have.

[fol. 1852] Q. And those are presently in service, are they, in various parts of your line?

A. Yes, sir.

Q. Are those in service, or have they been in service in territory west of Albuquerque, including main lines in Arizona?

A. Yes, sir.

Q. Now, referring to the passenger locomotive showing for the Southern Pacific, which is on defendant's exhibit No. 6, have you examined a copy of that exhibit?

A. Yes, I have.

Q. Does the Santa Fe have passenger locomotives, or locomotives used for both freight and passenger service, which correspond to or resemble those shown on Exhibit No. 6?

A. Yes, they do, with the exception that we do not have the A. C.

Q. There are no A. C.'s shown?

A. I notice some passenger trains are handled with your A. C.'s, but with that exception, our passenger power is quite similar to yours.

Q. You have a passenger locomotive with the 4-8-4 wheel arrangement?

A. Yes, and the 4-8-2.

Q. What is the tractive effort of your 4-8-4 locomotive? [fol. 1853] A. 66,000; weight on drivers, 269,400.

Q. And of your 4-8-2 locomotive?

A. 56,800; weight on drivers, 243,100.

Q. Do you have a Pacific type locomotive in passenger service? A 4-6-2 arrangement?

A. Yes, we do.

Q. I say, do you have one; I mean, do you have that type, a considerable number?

A. Yes, we have that type, a 4-6-2. The tractive force is 39,650; weight on drivers 167,500.

Q. Are those various types of passenger locomotives to which you have just referred in service in the territory west of Albuquerque, including the main lines in Arizona?

A. Yes, they are.

Q. You also use locomotives not propelled by steam, do you not?

A. Yes, by Diesel power.

Q. Do you use those in freight service as well as passenger service?

A. We have two freight Diesel locomotives. The first trip was made in freight service; started from Kansas City, Missouri, Saturday, January fourth.

[fol. 1854] Q. Have they been used east of Kansas City from time to time?

A. We had one on our railroad along in February of last year that we tested and made some runs with.

Q. Is that the M 103, referred to on the first sheet of Exhibit 138?

A. Yes, sir.

Q. It is referred to also on the second sheet at least once?

A. Yes.

Mr. Strauss: When you say "sheet," what are you referring to there?

Mr. Mason: No. 138, the freight train exhibit.

The Witness: If I may, I want to include another type of locomotive that was not on any other sheet that we use in passenger service, what we call the 3765 class.

Q. What is the wheel arrangement?

A. 4-8-4. That is the latest type passenger locomotive purchased by our company. The tractive force is 66,000 pounds; weight on drivers, 286,800.

Q. Does the Santa Fe use oil or coal as a fuel for its locomotives, or both?

A. We use both. On our transcontinental main line from [fol. 1855] Chicago to Los Angeles, or San Diego, San Francisco, through Amarillo, the Clovis territory, we use oil from Kansas City to California, except for the district between Winslow and Clovis, where we still burn coal. Over the Northern route, all freight service burns coal, and all passenger service burns oil.

Q. That is the La Junta route, is it?

A. That is correct; over the La Junta route.

Q. And you use oil entirely west of Winslow, Arizona?

A. Yes, sir. I might conclude by saying that we use coal on all freight trains between Chicago and Kansas City, but at the present time approximately fifty per cent of our passenger locomotives are equipped to burn oil.

Q. In that territory?

A. In that territory.

Q. Where you use coal-burning locomotives on main lines, are those hand-fired or stoker-fired?

A. Stoker-fired, with the exception of the smaller engines, they are hand-fired. The Mikado types are hand-fired, the Mountain types are stoker-fired.

Q. What type of reverse gear is used on these locomo- [fol. 1856] tives? Does the engineer have to use his own power, or does he have some assistance?

A. What I would call an air reverse. I can't tell you the name of it.

Q. Sometimes called a power reverse gear?

A. Yes.

Q. Are you familiar in a general way with the character of the commodities handled by the Santa Fe eastward and westward on its main line, particularly across Arizona?

A. I am.

Q. What are some of the principal commodities handled in eastbound movement within or across Arizona upon the main line?

A. Predominantly perishables, fruits and vegetables, other edible commodities such as canned goods, dried fruit, sugar, products of forests, lumber, and there are some ores moving from Arizona out of the state on our line as well as bullion, and then, at certain seasons of the year, there is a considerable livestock movement east.

Q. Now, what is the general description of the commodities moving westbound on the main lines which cross the state of Arizona?

A. General manufactured articles, or steel and building [fol. 1857] materials, general run of merchandise. In the last few years we have had quite a movement of automobile parts to the assembling plants in California.

Q. Do you have any considerable livestock movement either steadily or seasonal westward?

A. We have almost a constant movement of livestock, both hogs and cattle, for slaughter; then there are certain seasons of the year that we do have more livestock, particularly hogs, that will move in volume, and there is some feeder stock to the feed lots in California that originates in the Panhandle of Texas, Oklahoma, that we move to California.

Q. Is there a substantial movement of empty cars westbound?

A. Yes. Particularly our movement of empty refrigerator cars. There are times that we have moved some empty boxcars to California, but ordinarily, the boxcars going west under load will take care of the traffic originating in California and Arizona both.

Q. Does the Santa Fe have a substantial branch line mileage on its system?

A. Yes.

Q. Do you recall approximately the percentage of branch [fol. 1858] line mileage to the total mileage between Chicago and California?

A. I can tell you about what it is for the System. I would have to calculate it on the main line.

Q. I mean for the entire System.

A. Our total mileage operated is 13,414.33. Of that total mileage 6,619.40 is main line mileage, and 6,794.43 is branch line mileage.

Q. Now, you have spoken of the predominant eastward movement consisting largely of perishable fruits and vegetables and other edible commodities. Do you maintain schedules relating to this eastward movement?

A. Yes.

Q. Those are the schedules to which you previously referred as being the result of the efforts of the committee of which you are chairman?

A. That is correct.

Q. Are you familiar with the development of the eastward schedules as they operate over the Santa Fe and in connection with the carriers with which it connects?

A. Yes, I am.

Q. How are these schedules made up; that is, upon what [fol. 1859] departure points and departure hours, are they based?

A. From California, traffic loaded on a given day is concentrated or assembled on the various lines at Roseville, Sacramento, Bakersfield, San Bernardino, and Colton, California.

Q. Which of those points are Santa Fe concentration points?

A. San Bernardino and Bakersfield. The basic schedule for the movement of traffic originating in California is that traffic will depart from those concentration points three A. M. of the day following the date of loading, and due to arrive at Chicago 12:30 A. M. of the sixth day, or a total of 139 hours and thirty minutes overall running time, predicated upon a three A. M. departure.

Q. Now, suppose that you have four or five trains due to depart from the concentration point at Bakersfield at three A. M. of a particular day. Can they all depart at three A. M.?

A. No.

Q. Do any of them actually depart at three A. M. in actual practice?

A. I don't believe we, or our neighboring lines, have had a train out of concentration point at three A. M. fol- [fol. 1860] lowing the date of loading in several years, for the reason that by conference with our fruit industry in California, under what we call the pre-cooling plan, we permit shippers of deciduous fruits, grapes, cantaloupes, to pre-cool their fruit until five A. M. following the date of loading. When those commodities are moving, pick-up service is not started by any of the originating lines in California until around five A. M. Using the Santa Fe as an example, we operate nine hundred miles of main line and branch line in Northern California, and we operate pick-up trains over that much mileage, assemble the fruit, and all fruit arriving at Bakersfield by seven P. M. of the day following the date of loading is due for movement out of that point on that date.

Q. And what schedule does that freight take if it arrives at Bakersfield at or prior to seven P. M. following the date of loading?

A. That takes the schedule of three A. M. that same morning. Consequently——

Q. Three A. M. of the morning preceding, is that correct, of the same day?

A. Of the same day. Consequently, trains bunch up; groups arrive bunched at Bakersfield, and our last section [fol. 1861] out of that concentration point will depart around midnight.

Q. What do you call the time interval between three A. M. when the schedule theoretically commences, and the time of the departure of the individual train that is running on the schedule?

A. We call that the run-off.

Q. From what is the significance of the term "run-off" derived?

A. Well, the basic schedule predicated upon a three A. M. departure of the first day arriving at Chicago 12:30 A. M. of the sixth day, or a total of 139 hours and thirty minutes, that is the maximum schedule, less the basic sixteen-hour run-off; but instead of the sixteen hours under our present plan of operations, or since we agreed with the shippers to permit them to cool their traffic until five A. M., we actually have in our operations a twenty to a twenty-one and even a twenty-two and twenty-three-hour run-off, so we are actually operating on a schedule of about 118 to 121 hours.

Q. When you speak of run-off, does that mean that you so operate these trains as to run off this late departure and make the 12:30 A. M. arrival in Chicago as if they had de- [fol. 1862] parted at three A. M.?

A. That is correct.

The Court: We will take our mid-afternoon recess.

(Thereupon, a short recess was taken, after which the witness J. J. Mahoney was recalled to the stand, and proceedings were resumed as follows:)

The Court: You may proceed.

The Witness: Where I stated that the basic schedule provided arrival at Chicago 12:30 A. M. of the sixth day, I would like to have the record corrected to show that seventh day.

The Court: It may be corrected.

Mr. Mason: That is the seventh morning by thirty minutes.

A. The seventh morning by thirty minutes.

Q. From departure from Bakersfield? Now, is there a similar schedule on traffic originating in the Salt River Valley and handled by the Santa Fe?

A. Yes; there is.

Q. What is the elapsed time, and the departure point on Salt River Valley traffic?

A. The Salt River Valley present schedule provides de- [fol. 1863] parture, the basic schedule is depart 11:30 P. M. the day of loading, but through agreement with our shippers in the Valley we depart on two to four o'clock in the morning, arrive at Chicago 11:59 P. M. of the fourth evening, the basic schedule containing 95 hours and 29 minutes, traffic available for fifth morning delivery at Chicago.

The Court: Mr. Mahoney, before I forget it, will you explain this pre-cooling arrangement, and just how that matter works out?

A. Yes. Shippers of deciduous fruits, melons, grapes, they load their cars during the day up until midnight in some instances and if they give the carrier the bill of lading by midnight, then they are permitted to pre-cool the traffic until five A. M. the following morning. That pre-cooling is generally done by the shipper or his agent, the carrier does very little pre-cooling at the loading stations. This pre-cooling is generally done at the loading station.

The Court: And of what does it consist?

A. It consists of an apparatus that they put in those bunkers that you were questioning about this morning, and with fans they blow the air through the ice and pre-cool the fruits, and then before the car departs from the station they [fol. 1864] fully ice the bunkers to full capacity, and by that arrangement it brings the temperature of the fruit down quickly and the shippers tell us, the carriers, that under that plan of pre-cooling the fruit it arrives at markets and destinations in a much better shape. In fact, they can leave the fruit remain on the trees or the melons on the vine and get riper under that plan of shipping than without the pre-cooling.

Mr. Mason: The pre-cooling is all done before the traffic receives a line haul?

A. I would say that that is the case 97 or 98 per cent of the times, but there are cases where we do move the car from

the loading station where their agency pre-cools the car, for that short distance.

Q. It is all done at either the loading point or in the origin territory?

A. That is correct.

The Court: And this pre-cooling is at the expense of the shipper?

A. Yes, sir.

Q. He pays extra for that?

A. He pays the agency that does the pre-cooling for him.

Mr. Mason: Does he pay an additional charge to the car-
[fol. 1865] rier for the additional ice consumed, if you know?

A. Well, if the carrier does the pre-cooling, he does, but in most instances, practically all of the pre-cooling of the deciduous, the melons and the grapes is done by the shipper, or some agency other than the carrier. Now, with the citrus, that is a different story. We do considerable pre-cooling at San Bernardino for the shippers with a pre-cooling plant that we have there.

The Court: Thank you.

[fol. 1866] Mr. Mason: Now, you were speaking of the schedules today as including sixteen and up to twenty-one hours of run-off time. Do you actually operate your trains so as to arrive at Chicago yards all at the same time?

A. No. Our operation provides that when we are running the trains in several sections, which is a common practice, the earlier sections are advanced into our outer yard at Chicago sufficiently in advance of the last section so those trains arriving early can be switched and classified, re-iced and delivered to eastern connections, or delivered to the Chicago Produce Terminal if the cars are so billed, and the last train, we figure on it arriving on schedule.

Q. Does the schedule, the basic schedule of 139 hours and 30 minutes from Bakersfield apply to traffic originating over a described extent of territory in Northern California?

A. At the present time the entire state of California gets that service of 139 hours and 30 minutes from concentration points to Chicago.

Q. You mean all points served by the Santa Fe or its short line connections?

A. Yes, sir.

Q. Suppose the traffic originates on the Southern Pacific
[fol. 1867] north of Sacramento, let us say at a point like

Oroville or Colusa, and is destined for line haul by the Santa Fe through California junctions with the Southern Pacific; does that receive that service?

A. It will receive that service provided the car is delivered to us at the junction in time to permit us to handle at Bakersfield by seven P. M. of the day following the date of loading; if not, it takes the one day longer schedule.

Q. As to the traffic originating on the Santa Fe itself, or its short line connections in California, you give it the schedule the next day following the day of loading?

A. Yes, sir.

Q. And has the territory as to which the schedule applies always included all of the Northern California points served by the Santa Fe?

A. No; we had California at one time zoned, Zone 1, Zone 2, and Zone 3, and traffic in Zone 1 got the shorter schedule, Zone 2 one day longer, and Zone 3 two days longer than the shorter schedule.

Q. Was Zone 1 then extended to include all of the territory?

A. Yes; in conferences with our industry and in order to [fol. 1868] to stabilize the market, we agreed to a schedule in June, 1929, of 154 hours for the entire state of California. Several changes have been made since that time.

Q. Was there at one time a basic schedule of 146 hours?

A. Yes. I have that record here; I will give you the correct dates.

Q. Are these all matters within your own personal knowledge?

A. Yes, sir.

Q. In the course of your duties?

A. February 13, 1924, the schedule from Bakersfield to Chicago, agreed schedule with the shipper, was 154 hours. That was the date we established that schedule.

Q. I want to ask you——

A. (Interrupting.) Prior to that the schedule was 180 hours.

Q. Now, I want to ask you, when you say the schedule from Bakersfield, do you know and, if so, will you state whether the schedule offered by your lines from points such as Roseville, Sacramento, San Bernardino and Colton were the same as from Bakersfield?

A. Yes, sir.

[fol. 1869] Q. Was there any provision in 1921 or previously for run-off time?

A. No, sir. In June, 1929, the schedule was reduced from 154 hours to 146 hours with the 16-hour run-off; and on May 24, 1940, the schedule was reduced from 146 hours to the present schedule of 139 hours and 30 minutes with a 16-hour run-off.

Q. When were the Zone 1 extensions made? First of all, before that question is answered, was there any provisions for Zones 1, 2 and 3 in 1921?

A. No. Prior to 1921 is when we had the zones, when we went to the 154 hour schedule, and I think I stated in my opening remarks the one hundred forty-six; it was the 154-hour basic schedule that eliminated the zones in California.

Q. When the 146-hour schedule went into effect—in 1929, was it?

A. 1929.

Q. 1929. Was there any provision then for run off or for zoning of the origin territory?

A. We made the provision then for the 16 hour run-off, and that did away with the zones.

Q. Now, I ask you if these schedules apply over competing lines at various concentration points; and I will ask you [fol. 1870] particularly if you know and, if so, will you state whether they apply over Southern Pacific concentration points?

A. The schedules since 1921, the basic 154 hour schedule that was uniform from all concentration points. We eliminated on the Santa Fe the zone system before the Southern Pacific Company did, and I don't have the date that the Southern Pacific Company eliminated their zones.

Q. So far as the basic schedules from concentration points are concerned, did the changes you have mentioned as taking place on the Santa Fe take place with reference to the Southern Pacific schedules on the same date?

A. Yes, sir, on the same date.

Q. The same schedules were applied by the Southern Pacific as were applied by the Santa Fe?

A. Yes, sir.

Q. Does the same schedule apply by the Southern Pacific via Salt River Valley, if you know?

A. Yes, sir.

Q. Does the Santa Fe participate jointly with the Southern Pacific applying to traffic originating on the Southern Pacific lines in the Imperial Valley or in the Yuma Valley?

A. Yes, sir.

[fol. 1871] Q. What relation do those schedules bear to the schedules from Salt River Valley points?

A. Traffic originating in the Imperial Valley to Chicago is given sixth day delivery there. I might describe it in this way: Service from the Salt River Valley is fifth day delivery at Chicago; from the Imperial Valley sixth day; and from Colton, San Bernardino, California, concentration points, seventh day; one day difference between each territory.

Q. There is approximately twenty-four hours difference in the schedules?

A. That is true.

Q. Were you present this morning when Mr. Cartmill described the service of inspection and repair performed on Pacific Fruit Express Company cars?

A. I was.

Q. Does the Santa Fe follow a similar or comparable system for the inspection and repair of its refrigerator cars?

A. It does, in this way: Cars that are to be furnished for loading in the Salt River Valley are cut out and inspected and prepared at Winslow, Arizona. Such cars when they arrive at Winslow are given the ordinary inspec-

[fol. 1872] tion, that is, for running gears, safety appliances and exterior inspection. When those cars are placed on the cleaning and repair tracks, they are given both an exterior and interior inspection and, following the same process as described by Mr. Cartmill, these cars are swept or scrubbed, whichever is required to condition the cars for loading. Cars that go on to San Bernardino and Bakersfield to be distributed in California are, on arrival, given the ordinary in-bound inspection by our train yard inspectors, covering the inspection of the running gear, the couplers, the wheels, the exterior, and then the cars are placed on cleaning tracks and are again inspected both as to the exterior and interior. From there the cars are, well, I am getting ahead of my story. We card the cars then that have been cleaned and made ready for perishable loadings, and then they are taken and distributed to some load-

ing territories, and when the loading is heavy, in Northern California, we do some of that work at Fresno, but it is the same process of inspection.

Q. Do you have shops at any points you have mentioned, or in the territory you have mentioned where the cars may be shopped if they require it?

A. Yes, we have shops at Winslow, San Bernardino, [fol. 1873] Bakersfield, Fresno, and Richmond up in the Bay District that repair our cars. Our situation is not similar as to the repairs, because we do our repairs at all of our repair points or shop points, whereas the heavier repairs are done at a few points, as I understood Mr. Cartmill's testimony, on the Southern Pacific.

Q. Your situation is different again in that your refrigerator cars are of system ownership rather than of car line ownership?

A. That is correct.

Q. When you receive or use cars, refrigerator cars, of other than Santa Fe ownership for your perishable loadings, do they follow the same process?

A. Yes, those cars, when we ask for assistance from some of the other car owners in times of car stress, those cars are inspected at interchange points where we receive them, and if they meet the requirements, we take them out on our line to points sometimes as far as California to load, but the inspection at the interchange junction determines whether or not the car can be made suitable for our loading.

Q. You say that you inspect these cars of other ownership at interchange points. Do you make inspections of [fol. 1874] cars received from connections at interchange points generally whether they be refrigerator cars or not?

A. Oh, yes, that is part of the interchange rules, but what I mean to convey is that we make the exterior and interior inspection of these empty refrigerator cars that we call for.

Q. By referring to the map, Exhibit No. 134, it appears that your line from Northern California running through Bakersfield and your line from Southern California running through San Bernardino meet and join at Barstow, California.

A. That is correct.

Q. Is Barstow a point at which trains are made up for eastward movement over the main line?

A. Yes.

Q. Is that a point at which you make up trains, for example, containing the perishable traffic you have described?

A. That is correct.

Q. That which has been concentrated at Bakersfield or San Bernardino?

A. Yes.

Q. In making up your trains at Barstow, do you observe any limitations as to number of cars?

A. No, we do this: We make up our trains at Barstow, [fol. 1875] we regulate the tonnage in our trains to 2,900 tons, that is, our perishable trains. Other trains handling dead freight, foreign, eastern foreign cars, company fuel oil, dead freight, why, we don't limit those and we handle more than seventy cars and also more than 2,900 tons per train.

[fol. 1876] Mr. Mason: Mr. Mahoney, when those trains reach Needles, California, do you make any adjustment of their lengths?

A. Yes, we adjust the trains at Needles, California, to meet the requirements of the Arizona law.

Q. You operate them eastward from Needles, California, in what lengths?

A. Lengths varying, I would say, from 62 to 65, up to 70 cars.

Q. Not exceeding 70 cars?

A. Not exceeding 70 cars.

Q. Do you observe that maximum length across Arizona and, if so, how far?

A. With our perishable trains we observe that length to Belen, New Mexico. With our trains that do not handle perishable traffic we observe it to Gallup, New Mexico, where in some instances we fill them out with coal or other traffic that may be available there to fill the trains out in excess of 70 cars.

Q. Why do you observe the consist made up at Needles as far as Belen instead of stopping at Gallup to fill out in the case of perishable trains?

A. In the operation of our perishable trains from Cali- [fol. 1877] fornia through trains departing Barstow, the consist of those trains is telegraphed to our red-ball depart-

ment of our car accountant's office at Topeka, Kansas, in train order. Each car is shown, the origin, the contents, the consignee, the consignor, and destination, and each car is given a symbol number. We move those trains through intact for the reason that that information from that Barstow 23 manifest telegraph report reaching the car accountant's office is disseminated and transmitted to all of our division freight agents and off-line agents and they in turn notify the shipper of the movement of the cars in those trains and they also, after the train leaves Barstow, are given a passing at intervals across to Chicago and with that information the receivers or shippers of those cars can divert those cars to the various destinations that they want to try to dispose of their car.

Q. Is Belen a point at which diversion is undertaken or accomplished?

A. Belen, New Mexico, is one of our main diversion points.

Q. Is that a point at which perishable trains are re-iced and made up?

A. Yes, that is one of our regular icing stations and [fol. 1878] trains arriving Belen are fruit trains. Three trains into Belen generally make two trains out, and trains departing Belen, telegraphic reports again are sent to our car accounting office and all of our general agents, off-line agents, and division freight agents are notified of the trains. the traffic is moving in so diversion can be accomplished between there and the Missouri River.

Q. Why wouldn't it be possible or practicable, if that is a more applicable term, to stop these trains at Gallup and do this re-constituting instead of at Belen?

A. We have no icing facilities at Gallup, New Mexico, and we prefer to handle the cars through to Belen where we have the icing plant and too, with the movement of our trains through to Belen we get many diversions that takes the traffic out of the route through the Amarillo gateway, it goes through the Denver gateway or the La Junta gateway and sometimes to El Paso. We also receive diversions at that point that divert the traffic on our rail at Clovis, New Mexico, into the southeastern territory through Houston and Beaumont.

Q. On the Pecos Valley line?

A. Down on that line, yes, sir.

[fol. 1879] The Court: On your westbound traffic where do you make up those trains to correspond with the Arizona law, at Belen or Gallup?

A. At Gallup, because the nature of our westbound traffic is not perishable. We do handle some perishable packing house products.

The Court: You don't have the icing problem on your westbound?

A. No, sir.

Mr. Mason: Is Gallup the point at which trains are cut down to fit the Arizona law requirements?

A. Westbound?

Q. Yes.

A. Yes, sir.

Q. Is there any point, and if so what is the point at which they are reconstituted after leaving Arizona?

A. We do reconstitute a few trains at Needles, but not many. The principal point is Barstow, California, where the trains are reswitched. That is where the northern and southern lines converge and that is where the trains automatically go through a reswitching or reorganization.

The Court: You are speaking now of the westbound traffic?

A. Yes, sir.

[fol. 1880] The Court: In other words the train as it leaves Gallup would run intact, we will say, to Barstow rather than to Needles?

A. Yes, sir. I would say that would be the case 97 to 98 per cent of the time. I might say this for the benefit of the court, that on my way out here I stopped at Gallup and I stopped at Winslow and I made a check during the month of June. We had 54 trains during the month of June that were reduced from six to twenty cars at Gallup. I have the station record with me, just out of curiosity more than anything else that I stopped there for that purpose but I have a list of the trains, the conductor handling the trains in and the conductor out. The smallest number of cars reduced was six and the largest number, twenty, in the 54 trains that were reduced during the month of June.

Mr. Mason: Did you make any study as to the number of trains which were stopped at Gallup and built up to lengths greater than 70 cars eastbound?

A. No, I did not. In our operations eastbound we do handle quite often 3,100 tons from Winslow to Belen and with our trains arriving at Winslow, Arizona, containing 2,900 tons, when they get to Gallup we generally add [fol. 1881] enough cars on those eastbound trains to make a tonnage around 3,100 tons.

Q. You say when they get to Gallup or when they get to Winslow?

A. Gallup. That is the coal and lumber that comes to us from the Apache. We add on those and fill them out to 3,100 tons.

The Court: When you do that do you have to add a helper engine to get over the Continental Divide?

A. No, we don't. That is the capacity of the type of locomotive that they operate there. They can handle that much tonnage. I might say for the benefit of the court that we have in a good many instances double-headed our trains from Winslow to the top of the Divide in order to overcome some delay built up at concentration points waiting for the pre-cooled fruit. We don't do that very often, but if operating interferences are such that we are not able to overcome much of that delay by double-heading up to the top of the Divide we can make up two to three hours in some instances.

Mr. Mason: You spoke of making up your trains into tonnage not exceeding 2,900 at Barstow where perishable was involved?

A. What I meant to convey was that we do not do that [fol. 1882] very often with a train of perishables. We have taken 2,900 tons of perishables, filled it out to 4,000 tons with company fuel oil, say for Needles, and gave them a helper to Goffs and handled the 4,000 tons to Needles and then cut off the fuel oil or dead freight so the train will be 2,900 tons of freight leaving Needles.

Q. Why do you observe a 2,900-ton limitation, if you do observe it, leaving Needles eastward?

A. That is a contractual agreement we have with the conductors and trainmen that 2,900 tons is the maximum tonnage that we will handle between Seligman and Winslow, Arizona, with double-header trains.

Q. Does that 2,900-ton limitation apply to trains handled with a single engine?

A. No, if we had a locomotive of sufficient tractive effort to handle 4,000 tons we could handle it, providing the 4,000 tons could be placed in 70 cars. There is no limitation other than the 70 cars for one locomotive.

Q. But you do have an agreement with the two brotherhoods, the Train Service Brotherhoods that you have mentioned, that you will not handle more than 2,900 tons between Seligman and Winslow with two or more locomotives?

[fol. 1883] A. That is correct.

The Court: What is the reason for that?

A. That, Your Honor, is the outgrowth of an agreement with our conductors——

Mr. Strouss: (Interrupting) If the court please, we are not getting into an opinion of the witness as to his point of view.

The Court: Maybe I shouldn't have asked the question. I will withdraw it if you object. Go ahead, Mr. Mason.

Mr. Strouss: I don't want to prevent the court from having any proper information. There may be two sides to the agreement.

The Witness: I think there are two sides to it, Mr. Strouss, but I think we have the record of the agreements since 1903 when the first double-header agreement was made with our two organizations?

Mr. Strouss: I have no objection to the agreement itself.

The Court: That double-header agreement is by reason of the mountainous territory betwen Seligman and Winslow?

A. That is correct.

Mr. Mason: This agreement that you refer to, the current 2,900-ton agreement, dates from what year?

[fol. 1884] A. 1924.

Q. And is carried in your working agreements with these two brotherhoods?

A. Yes, sir.

Q. Relating to the trainmen's craft and the conductors' craft?

A. That is correct.

Q. And is not in any state or Federal statute of which you have knowledge?

A. No, sir.

Q. You were asked by the court whether the agreement was effective in mountainous territory. As I understand it, the agreement applies only to trains which are being handled with two or more locomotives?

A. That is correct.

Q. If a single engine were to handle the train in the same territory, the agreement would not apply?

Mr. Strouss: I think they have a copy of that agreement and if they are going into all the details of it I ask that it be produced.

The Court: Yes, I think it should be produced, but frankly I don't think that is going to be particularly helpful to the court. Maybe it was just curiosity on my part.

[fol. 1885] Mr. Mason: The purpose of bringing this into the record was to show how the agreement may operate either in conjunction or alternatively to the 70-car limitation.

The Court: Well, in this matter we are concerned with the law and not with an agreement.

Mr. Strouss: I am not objecting to the materiality of the agreement. I think it is material, except going into the details of it.

Mr. Mason: I didn't intend to go any further into the details of it on direct examination. Of course the witness in his position, and necessarily because of his position and duties, must be familiar with the effect at least of the agreement upon his operations.

The Court: Yes, but that would not obviate the necessity of producing it if you are going into it.

The Witness: I might say this, Judge——

Mr. Strouss: (Interrupting) I object to the witness volunteering so much, we are getting pretty far afield here. I have a hard enough time keeping track of counsel's questions without watching for voluntary statements by the witness.

Mr. Mason: I call your attention to exhibit No. 138 [fol. 1886] which was introduced when Mr. Weeks was on the stand. Did you select the period of the first ten days of February, 1940, to which this exhibit relates?

A. I did.

Q. Did you instruct Mr. Weeks to prepare or have prepared this exhibit?

A. I did.

Q. Will you state, basing your statement upon your experience and knowledge as the general superintendent of transportation and in your previous employment, whether the month of February and the period from the first to the tenth of February is a peak period or an off-peak period from the standpoint of traffic on the main line of the Santa Fe?

A. It is the lightest period we have. The reason I selected that period is that I did not want to show an abnormal situation. I preferred to show a subnormal rather than an abnormal.

The Court: Then this is not an average period?

A. No, it is the lightest period on our railroad.

Mr. Mason: Is it correct to say that in any other month which might have been selected, whether of 1940 or 1939, the volume of the traffic would have been heavier?

[fol. 1887] A. Yes, the volume handled would be heavier.

Q. Would that result in any longer trains or in the average length of the trains being longer if another period had been selected?

A. In my opinion it would have and that is the reason I selected the period.

Mr. Strouss: My objection is going to all of this.

Mr. Mason: Will you state from your own knowledge whether there is any 2,900-ton agreement similar to the one applying between Seligman and Winslow effective on any part of your lines in the state of New Mexico?

A. No, there is none.

Q. Or on any part of your lines in the state of California.

A. No, sir.

Q. Or elsewhere on your system?

A. There is none other than that one between Winslow and Needles.

Q. Is there any agreement expressing a tonnage limitation upon the trains which you may operate upon any other part of your system than the particular district that you have referred to?

A. None other than the double-header rule that is applicable to the entire contract which provides that double-[fol. 1888] header trains will not be run in excess of 40 cars, followed with an exception that trains may be operated

with double-headers providing the tonnage of the heaviest locomotive is not exceeded.

Q. Is that the clause which also provides exception for certain recognized helper districts?

A. Yes, sir.

[fol. 1889] Q. I notice that Exhibit 138, Mr. Mahoney, shows various types of locomotives employed on these trains. What is the wheel arrangement of the Prairie type?

A. That is a 2-6-2.

Q. And the Mikado?

A. 2-8-2. We have some Mikado types with the 2-8-4 and those are equipped with a booster.

Q. You show here Pacific type of 2-8-4. Does that mean that two different locomotives were used on one train?

A. Which item is that?

Q. It is midway on the first sheet between Argentine and Marceline.

A. The 2-8-4 Pacific type?

Q. If I understood you correctly the 2-8-4 is the Mikado type.

A. Those that have the booster on. The Mikado type without the booster is the 2-8-2. This 2-8-4 Pacific type is a passenger locomotive that we used on that train.

Q. You show on sheet 2 a consolidation locomotive. What is the wheel arrangement of the consolidation?

A. 2-8-0.

Q. You show also a Decapod. What is the wheel arrange-
[fol. 1890] ment of that?

A. 2-10-0.

Q. You show also on sheet No. 2 between Canadian and Waynoka three trains showing Mikados and Santa Fe. Does that mean that those trains were operated, one or more of them, with the Mikado and the other with the Santa Fe?

A. Yes, with the Santa Fe.

Q. Farther down the sheet you show Mikado and Pacific. Would that indicate that different locomotives were used, each of them on part of the district?

A. Yes, sir.

Q. Will you refer to exhibit 139, which was also received when Mr. Weeks was on the stand, and particularly to the first of the three, which indicates operations of passenger

trains between February 2nd and February 8th. Did you select that period for the purpose of this study?

A. Yes, I did.

Q. Did you direct Mr. Weeks to make the study for that period?

A. I did.

Q. Will you state your reasons for selecting February 2nd to 8th inclusive, of the present year?

[fol. 1891] A. My reasons for that are the same as I explained for the freight train showing, that I selected the light period rather than a period of heavy movement of passenger trains. I didn't want to show an abnormal situation.

Q. Would you say that the volume of traffic and consequent volume of cars moved in the first week of February as here indicated is less than the average.

A. Yes, it is.

Q. Would that result in more trains of fourteen cars or less and fewer trains of fifteen cars or more than otherwise?

A. Yes, it would.

The Court: Mr. Mahoney, I notice in the case of the freight trains, that that was given for a ten-day period whereas the passenger you only take a week, the second to the eighth inclusive.

A. That is correct. I selected the freight-train period for a ten-day period and I didn't understand—I didn't intend to put in anything in regard to the passenger train showing, and after I studied the situation over I thought I would make a showing also for the passenger trains, but I selected two periods for the passenger trains.

[fol. 1892] The Court: Which two.

A. February 2nd to 8th and November 17th to 23rd, two seven-day periods during 1940.

Mr. Mason: You are referring now to pages 4, 5, and 6, as relating to the period November 17th to 23rd?

A. That is correct.

The Court: Is that also a subnormal period?

A. Yes, sir, it is.

Mr. Mason: Referring to Exhibit No. 139, Mr. Mahoney, are there any trains on here of the so-called streamliner type Diesel operated?

A. Yes, sir.

Q. Will you indicate them by name?

A. On sheet one, trains identified as No. 17, the Super-Chief, No. 21, the El Capitan, are streamlined trains handled by Diesel power. Train 19, the equipment in that train is light weight with the exception of the baggage and mail car and is drawn by steam power and also Diesel power.

Q. Do the same comments apply to the opposite number eastward, 18, 20 and 22?

A. Yes, sir, they do.

The Court: Those trains do not run daily.

A. The Super-Chief and the El Capitan run twice a week. The Chief runs daily.

[fol. 1893] Mr. Mason: Mr. Mahoney, does the Arizona limitation of fourteen cars per passenger train have any effect upon the consisting or scheduling of your passenger trains or your passenger service?

A. Yes, it has a serious effect.

Q. Will you describe it?

A. In our timetable conferences when there is a change of timetable, the consist and schedules of our trains are predicated upon not exceeding fourteen cars, that is, our transcontinental passenger trains, in order to conform with the Arizona law.

The Court: You mean you make them up that way from Chicago?

A. Yes, sir, we consist the trains so they will not exceed fourteen cars. Now, we do have some trains that the normal consist is fourteen cars, and when we get an extra car in those trains we split the trains either at Albuquerque or Gallup. I have a consist with me here that we split up at Gallup with fifteen cars on the fourth of this month. I happened to be there and we had to split No. 3 on account of having fifteen cars, one extra car in the train. Likewise, our eastbound movement from Los Angeles the consist of our [fol. 1894] trains in setting up our timetables and the consists of the trains, the number of cars is predicated upon staying within the car limit of the Arizona law and it is a serious handicap to us in meeting competitive situations through the Omaha-Council Bluffs-Ogden Gateway where there is no limit to the number of passenger cars that can be handled in a train.

Mr. Mason: Do you compete for the Southern California business with the Union Pacific Northwestern route through Omaha, Salt Lake City and Southern Nevada to Los Angeles?

A. Yes, sir.

Q. Do they operate to your knowledge a train service comparable or competitive with your Super-Chief?

A. They do.

Q. Do you know what its name is?

A. City of Los Angeles. They also operate a Challenger that is in direct competition with our Scout service, which trains handle chair car and tourist sleepers and those trains handle an excess of fourteen cars from Chicago through to Los Angeles.

Mr. Strouss: My objection is going to this testimony, Your Honor.

[fol. 1895] The Court: Yes, the record may show your objection and it is overruled.

Mr. Strouss: This is a matter which is capable of proof by evidence rather than a conclusion or argument of the witness.

Mr. Mason: I call the Court's attention to the fact that the movement of trains over the competing route is already in evidence by Exhibit 92.

Q. Have you seen Exhibit No. 92, Mr. Mahoney?

A. No, I have not.

The Court: That is the data put in by the witness for the Union Pacific?

Mr. Mason: That was Mr. Warfel, the witness for the Union Pacific, showing the operation of the trains over his lines handling the traffic between Chicago and Los Angeles.

The Court: The court will be at recess until ten o'clock tomorrow morning.

(Thereupon, the court stood at recess until ten A. M. Wednesday, January 8, 1941.)

[fol. 1896] January 8, 1941, Ten o'clock A. M.

Proceedings were resumed at this time as follows:

The Court: You may proceed.

J. J. MAHONEY was recalled to the stand, and testified further as follows:

Direct examination (Continued).

By Mr. Mason:

Q. Mr. Mahoney, at the conclusion of the proceedings yesterday the testimony had reference to trains operated by the Union Pacific over the route between Chicago and Los Angeles, as compared to those operated by the Santa Fe over its competing route between Chicago and Los Angeles in passenger service. I will ask you if the trains of the Union Pacific over the route in question operate for a part of the distance over the rails of the Santa Fe?

A. Yes, they use Santa Fe rails from Daggett to Riverside, California.

Q. Do you in your position as general superintendent of transportation of the Santa Fe receive any periodical reports of the consists of these Union Pacific passenger trains [fol. 1897] passing over your rails?

A. Yes, our 87 telegraphic report, which report shows all passenger trains and manifest freight trains operated on that railroad, and their status as to the performance, are received daily in my office, which shows the locomotive and the number; number of cars there are in each train handled.

Q. And includes these Union Pacific passenger trains?

A. Yes, includes these Union Pacific passenger trains.

Q. Do you in the course of your duties ever have occasion to visit the Los Angeles Union passenger terminal?

A. Yes, I do.

Q. Do the Santa Fe trains between Chicago and Los Angeles operate into and out of that terminal?

A. Yes, the same union terminal.

Q. Do the Union Pacific trains also operate in and out of that terminal?

A. Yes.

Q. Do you ever observe the Union Pacific trains in that terminal?

A. Yes, quite often.

[fol. 1898] Q. Those that operate on the competing route with the Santa Fe?

A. Yes, sir.

Q. Yesterday you were asked and you explained to some extent the effect of the fourteen-car limitation of the Arizona

law upon your passenger traffic and your passenger train consist between Chicago and Los Angeles. I will ask you whether, in planning your passenger train service between Chicago and Los Angeles, you have to take into account, or do take into account, the fourteen-car limitation?

A. Yes, we do. In setting up the consists of our transcontinental passenger trains, both east- and westbound, we take into consideration the limitations in Arizona, fourteen-car limit.

Q. Is the space available on a passenger train definitely limited as to the number of passengers that may be carried?

A. Yes.

Q. Or, rather, the space on a passenger car, I should say.

A. Yes, there are limitations to the coaches, there is limitation to the chair cars, and the Pullman cars according to the type of Pullman car operated in the train.

[fol. 1899] Q. Do your transcontinental passenger trains, some of them, consist entirely or large of Pullmans?

A. Yes, we have what we call solid Pullman car trains. Then we have the mixed car trains, with the standard Pullmans, the chair cars, and with the tourist Pullmans and chair car.

Q. Your transcontinental trains usually carry dining cars and lounge cars, or either of them?

A. Yes, some carry dining car, lounge car and observation car. Others carry a dining car and a lounge car and no observation car.

Q. Suppose that a passenger train is operated out of Chicago and as far as Gallup or Albuquerque, consisting of more than fourteen cars and containing a dining car, or a lounge car, or an observation car, or all of those cars, what happens when that train reaches Gallup or Albuquerque on its westbound course?

A. We divide the train or split it into two sections. One section carries the dining car and the lounge car, and if the train carries observation, that stays with the Pullman section. We generally split the train on the basis of carrying the chair cars in one section and the Pullman section in the [fol. 1900] other. The chair car passengers from Gallup west to destination in most instances are taken care of at our Harvey eating houses, they are deprived of the dining car privileges from Gallup west.

Q. Why isn't it practicable to provide them with dining car service from Gallup west?

A. That would entail keeping extra dining cars located at Gallup or at Needles, whichever the case may be, to cut into these trains when it was necessary to split the trains in two sections, and that, we feel, is too expensive an operation.

Q. Well, as a practical matter, in planning your transcontinental trains, what course do you take?

A. Well, as I endeavored to make clear, we set the consists up not to exceed fourteen cars in our transcontinental trains both east and west. We do on many occasions handle in excess of fourteen cars, consisting of cars that are destined from Chicago to Denver, Chicago to Kansas City, Chicago to any point that might be short of Gallup, and then when we have cars destined to California, it is necessary to split the train to conform with the law at Gallup, and in some instances we split at Albuquerque.

[fol. 1901] Q. Is your passenger business largely a local business, or a short haul business between Chicago and Kansas City, Denver and intermediate points, or more largely a transcontinental business?

A. Our larger volume of passenger business is on the transcontinental line from Chicago to Los Angeles. The greatest number of passengers handled on our line is between Chicago and Kansas City; the second largest number is from Kansas City to Los Angeles.

Q. Do you ever have special parties operating in special trains, or extra sections of revenue trains?

A. Yes, quite often in the summer months we have special parties, and we operate extra sections of our transcontinental trains.

Q. Do you ever have special parties of such number of persons that they occupy with their baggage and necessary accessories, more than fourteen cars?

A. Yes, we do.

Q. What do you do with those when you reach the Arizona line?

Mr. Strouss: It is understood my objection is going to this.

[fol. 1902] The Court: Yes, the record may show.

A. We split those trains to conform with the law.

Mr. Mason: Does that entail having extra dining cars? What is the result of that?

A. We have on many occasions provided the additional dining car for these special parties, and special trains in order to take care of the split at Gallup, which necessitated handling the second diner all the way through. Other times, dependent on the schedule, whether the train passes through that territory at night, we do split the train and can get by with the one dining car.

Q. Yesterday, in the course of your testimony, Mr. Mahoney, I think you referred to a ten P. M. departure from day of loading of traffic loaded in the Salt River valley. Do you wish to correct that statement?

A. Yes; the latest change on that schedule, the basic schedule is 11:30 P. M. departure, with a privilege permitting the shippers in the Salt River valley to pre-cool their traffic until two A. M. and arrive at Chicago 11:59 of the fourth evening.

Mr. Mason: Then, we will say, for the information of [fol. 1903] Court and counsel that the statement now being corrected appears on page 1863 of yesterday's transcript.

Q. Mr. Mahoney, does the Santa Fe have certain districts on its railroad where two locomotives are used to operate trains, which elsewhere are operated with a single locomotive?

A. Yes.

Q. So-called freight helper districts?

A. Yes, we do have freight helper districts in practically all parts of our railroad.

Q. Where are those freight helper districts?

The Court: You mean in Arizona, Mr. Mason?

Mr. Mason: Not alone in Arizona, but outside of Arizona as well.

A. I checked up last night, and I find that in California we have helper districts between Hector and Ash Hill, eastbound 26 miles; the grade is one per cent; Bagdad to Goffs, eastbound 60 miles, one per cent; Needles to Goffs, westbound, 31 miles, 1.4 per cent grade; Bagdad to Lavic, westbound, 31 miles, 1.4 per cent grade. In Arizona ——

Q. Those are the helper grades east of Barstow?

A. Yes, sir.

[fol. 1904] Q. Is there a helper district in the Cajon Pass?

A. Yes, sir.

Q. And also over Tehachapi Pass between Bakersfield and Mojave?

A. Yes.

Q. Now, in Arizona.

A. In Arizona, Ashfork to Supai, eastbound, 23 miles, 1.8 grade; no westbound helper district. In New Mexico, Belen to Mountainair, eastbound, 41 miles, 1.25 grade; Belen to Dalies, westbound, 10 miles, 1.25 grade. Between New Mexico and Chicago, eastbound, Canadian to Coburn, Texas, 18 miles of .6 per cent grade; and on the Kansas City Belt Line, one mile of .9 per cent grade; westbound, Chillicothe to Edelstein, Illinois, 8 miles, 1.1 per cent grade; on the Kansas City Belt Line, 1 mile .9 per cent grade; Waynoka to Curtis, Oklahoma, 22 miles, one per cent grade.

Q. Those are on your principal freight lines, are they?

A. This is on the line, our transcontinental freight line; I selected these helper districts.

Q. The so-called Belen cut-off, to which the Court referred?

A. Yes, that is over the Belen Cut-off. Now, in addition to [fol. 1905] that we do have other helper grades on other parts of the System, but I just picked those out on this particular line. Now, these helper districts are separate and distinct from this 2,900-ton agreement, as we call it, with our transportation organizations.

Q. Do you have on the Santa Fe a code or book of rules for the guidance of employees in your transportation department?

A. Yes, we do.

Q. Are you familiar with the standard code of operating rules of the Association of American Railroads?

A. Yes, I have read that several times.

Q. Does the Santa Fe rule book resemble the standard code of rules of the A. A. R.?

A. It follows the standard code very closely. There are a few exceptions to conform to local conditions on our line that differ from the standard code.

[fol. 1906] Mr. Mason: Mr. Mahoney, you spoke of operating some of your trains with Pullman cars. Are those the standard conventional type of Pullman cars that one sees in ordinary passenger trains?

A. Yes, we operate trains with what we call the conventional Pullman type and also the streamline type.

Q. Do you have some lightweight Pullman equipment as well?

A. Yes, sir.

Q. Of recent construction?

A. Yes.

Q. Does the Santa Fe run through any territory between Chicago and Los Angeles where relatively severe winter temperatures are encountered?

A. Yes, we do. We encounter severe cold weather in the winter months from Chicago, you might say, to Needles. At times the weather is quite severe. We encounter the most severe weather I think in Colorado and parts of New Mexico and some in Arizona.

Q. Do you on parts of that line other than in Arizona operate passenger trains of more than 14 cars during the winter months?

A. Yes, we do.

Q. Will you say whether or not you have imposed any [fol. 1907] limitation upon the lengths of your passenger trains during the winter months because of failure to heat or difficulty in heating the rear cars of such passenger trains?

A. Yes, we have. Our maximum consist in severe cold weather would be about 16 to 17 cars. Beyond that we would split the train.

Q. What do you mean by "severe cold weather"?

A. Five to ten below zero.

Q. Have you ever found it necessary to reduce to 14 cars or less because of five or ten degrees below zero?

A. No, we feel we can heat that number of cars satisfactorily.

Q. Do you run your locomotives in freight service over more than one freight district?

A. Yes, we do.

Q. Will you state the length of some of your typical locomotive runs in freight service on your main line through trains?

A. We operate our freight locomotives from Marceline, Missouri, to Kansas City, and we have in some instances freight locomotives from Chicago to Kansas City. The reason that we do not do that more than we do is on account of the locomotives on the Illinois division being [fol. 1908] equipped with automatic train control and we keep those locomotives pretty well allocated on the Illinois

division. From Kansas City west we operate freight locomotives to Arkansas City and Wellington, Kansas, and Newton, Kansas. We operate locomotives from Wellington, Kansas, to Clovis, New Mexico; from Clovis, New Mexico, to Belen and from Belen to Winslow. We have operated freight locomotives through from Winslow to Barstow and in some instances they are changed at Seligman. If they are changed at Seligman, they generally run through to Barstow. The running through of freight locomotives depends generally on the conditions of the locomotives. If the locomotive is functioning properly, we take advantage and operate through several terminals. If not, they are alternated with engines that are held at those terminals.

Q. Mr. Mahoney, generally speaking and apart from any restriction such as the 70-car limit, what considerations in your experience on the Santa Fe govern the lengths of the freight trains that you operate?

A. The traffic that is available at the terminal at the time the train is run and the capacity of the locomotive that is going to handle the train govern the tonnage and [fol. 1909] cars to be handled. There are times that we do give consideration to whether or not the train is on schedule, how much late the train is, and in some instances we have to adjust the tonnage to conform with the schedule we are going to make.

Mr. Mason: I think that is all, Mr. Mahoney, thank you. Cross-examine.

Mr. Strouss: I would like to reserve my cross-examination until after lunch, if I may?

The Court: All right. Call the next witness.

L. J. Masson was recalled as a witness in behalf of the defendant and having been previously sworn testified further as follows:

Direct examination (Continued).

By Mr. Mason:

Mr. Mason: Your Honor will recall that prior to the recess on December 14 Mr. Masson had been qualified and I think had introduced one exhibit, No. 115.

The Court: Yes, he is the assistant general auditor of the Southern Pacific Company with headquarters at San Francisco.

Mr. Mason: That is correct.

[fol. 1910] Q. Mr. Masson, I will ask you if you will refer, please, to a statement in one sheet bearing title, "Southern Pacific Company-Pacific Lines, Freight Revenues within the State of Arizona, Years 1912 to 1939, Inclusive." Have you that statement before you?

A. Yes, sir.

Mr. Mason: May we have the statement just referred to marked "Defendant's Exhibit No. 141" for identification?

The Court: It may be marked.

The Clerk: Defendant's exhibit No. 141 for identification.

Mr. Mason: Did you prepare or cause to be prepared exhibit No. 141?

A. I caused this to be prepared, it was prepared under my supervision and direction.

Q. Is the source as shown at the foot of the exhibit itself?

A. Yes.

Q. Is the exhibit entirely taken from the figures appearing in the annual reports to the Corporation Commission of the state of Arizona?

A. Yes.

Q. Are the reports to the Corporation Commission from [fol. 1911] which this is taken available in the city?

A. The reports to the Corporation Commission for the years 1922 to 1939 are in the courtroom. If counsel desires the reports from 1912 to 1921, they will be made available to him.

Mr. Strouss: I don't desire them. You have your reports from 1922 to 1939?

A. 1922 to 1939 here.

Mr. Strouss: The earlier ones I will not ask for.

Mr. Mason: Is the computation appearing in column 5 your own computation?

A. Yes, sir, that shows the percentage that column 3 is of column 4, indicating the predominance of revenues from interstate freight within the state of Arizona.

Q. Is column 2 the figure reported to the state commission for revenue upon wholly intrastate freight?

A. Yes, that is the revenue that accrues from freight picked up and laid down at points within the state without passing out of the state at any point.

Q. I will ask you to refer to column 3 and to note (B). Is the state proportion of revenue on interstate traffic as-
[fol. 1912] signed to the State in accordance with your own formula?

A. No, according to formula prescribed by the Corporation Commission of Arizona.

Q. Is the formula substantially as indicated by your note (B) based on the mileage pro rate of the total distance the freight may be carried?

A. Yes, sir.

Q. Have the computations of the other figures on the exhibit been checked against the original sources?

A. The figures on the exhibit have been checked against the original sources.

Q. Will you say whether or not the showing is a true and correct representation of the figures appearing in the original sources?

A. Yes, sir.

Q. And are the computations and percentages correct?

A. Yes, sir.

Mr. Mason: We offer the statement in evidence as defendant's exhibit No. 141 subject to any questions of opposing counsel.

Mr. Strouss: Column 3, interstate, you mean by that that is the portion of the interstate allocated to Arizona?

A. Yes, sir.

[fol. 1913] Mr. Strouss: Under the formula of the Arizona Corporation Commission?

A. Under the formula prescribed by the Arizona commission, dated September 23, 1914.

Mr. Strouss: That is the formula which was adopted by the Association of Commissions, wasn't it?

A. No, it is a little different to the formula prescribed by the Association of Railway Commissioners. That prescribes a different formula for allocations to states. This prescribes a special formula.

Mr. Strouss: We object to this as immaterial and irrelevant.

The Court: Objection overruled. It may be admitted in evidence.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 141.")

The Court: Do I understand with reference to this exhibit, Mr. Masson, column 3, that in accordance with the rules of the Arizona Corporation Commission any freight of any class originating within the state of Arizona that was hauled by your lines across the state line either way would be classed as "interstate"?

A. Yes, sir, interstate freight represents freight that [fol. 1914] originates outside the state and moves to a point in the state or that may originate at a point in the state and moves outside the state.

The Court: In other words, column 2 represents that percentage of your business which is wholly within the state of Arizona?

A. That is true.

The Court: The shipment originates in and stops in the state?

A. Terminates in the state, yes, sir.

Mr. Stronss: What is that formula of the Corporation Commission? I think the court should understand that.

Mr. Mason: I intend to develop it further by a concrete example.

Mr. Stronss: There is one question I should have asked there. The percentage of interstate total—just so I understand this exhibit—is that the ratio of the two columns 2 and 3?

A. No, that is the ratio of column 3 to column 4.

Mr. Mason: To state a concrete example of allocation of revenue, if a shipment moves from Phoenix to Tucson, originating on the Southern Pacific at Phoenix and de- [fol. 1915] livered by the Southern Pacific at Tucson, in what column of exhibit No. 141 will the revenue be placed?

A. In column 2.

Q. Suppose that a shipment originates at Colton, California, and moves to Tucson and is there delivered, in what column will the revenue received by the Southern Pacific Company for carrying that shipment be placed and how much of the revenue will be placed in that column?

A. The mileage proportion or the relative percentage that the mileage in Arizona bears to the total mileage

from Colton to Tucson. It would be put in column 3. To make it simple, let's assume that a shipment moves 100 miles, 50 miles of it moves in Arizona and 50 miles outside of Arizona. Fifty per cent of the revenue would be allocated to Arizona.

Q. Suppose a shipment which originates at Los Angeles and moves to El Paso, Texas, all of the haul being Southern Pacific, will any of the revenue received from the transportation of that shipment appear in column 3, and, if so, how much?

A. The mileage proportion through the state.

Q. From border to border?

A. From border to border.

Q. Of the total?

[fol. 1916] A. Of the total revenue.

Q. Will the same process be followed if the shipment originates at a point in Mexico, moving through the Nogales gateway and is delivered at a point outside of Arizona?

A. Yes, sir.

Q. Or delivered at a point inside of Arizona?

A. Yes.

Q. So in the interstate column appears the revenue apportioned to the mileage in Arizona on the pro rate basis from traffic moving across the state or from outside the state to a point within or from within the state to a point outside?

A. Correct. Let me go a little further. You confined your example to shipments originating on the Southern Pacific.

Q. I did, for simplicity, but what happens as to interline shipments?

A. The same process. In other words, if the shipment originates on the Santa Fe in Arizona, comes to us and is delivered at a point in Arizona, Tucson we will say, that is an intra-state shipment. It is an interline intrastate shipment. If it originates, we will say, in the East, on a foreign line, moves through Arizona, Arizona would get its mileage proportion of the revenue allocated or [fol. 1917] apportioned to the Southern Pacific of that shipment.

The Court: Would that be shown in column 2?

A. That would be shown in column 3, that is an interstate shipment.

Mr. Mason: Referring to your shipment originating on the Santa Fe and moving to a Southern Pacific point. Let's suppose the shipment originated at Flagstaff and moving via Phoenix to Tucson. The revenue from that shipment divides at Phoenix, part to the Santa Fe and part to the Southern Pacific?

A. Yes.

Q. How much of that revenue will appear in this statement and in what column?

A. The total Southern Pacific revenue will appear in column 2.

Q. But only the Southern Pacific proportion?

A. We are only dealing here with Southern Pacific revenue.

Q. Suppose a shipment originates on the Rock Island at Kansas City and moves via Tucumcari and El Paso and is delivered at Tucson, how much of that revenue in proportion will appear in exhibit No. 141 and in what column?

A. The revenue accruing to the Southern Pacific from [for 1918] Tucumcari to Tucson would be split and a mileage pro rate of that revenue would be allocated to Arizona and put in column 3.

Mr. Mason: Does that make it clear, Your Honor?

The Court: I think so.

Mr. Mason: Have you any other questions before we pass on to something else?

The Witness: For instance, a rate on a shipment that applies, we will say, from Chicago moving over the Rock Island, Tucumcari, Southern Pacific, divides on an established agreed percentage basis between the Rock Island and the Southern Pacific first.

The Court: I understand that but all of the revenue so far as the Southern Pacific is concerned and so far as this exhibit is concerned on such a shipment would be shown in column 3?

A. No, sir, only the Arizona mileage proportion would be allocated. That shipment moves through Arizona, New Mexico, and Texas and those states will get their cut out of it. It will be prorated between the respective states on a mileage basis in proportion to the mileage hauled in the respective states and Arizona would get its cut out

[fol. 1919] of that revenue and it would be put and is put in column 3.

Mr. Mason: Perhaps a concrete example would help. Suppose a shipment originates on the Texas and Pacific in Texas and moves a total haul of a thousand miles to a destination in Arizona of which one hundred miles are in Arizona and the total Southern Pacific haul is five hundred miles and the division between the Texas and Pacific and Southern Pacific is on a straight 50 per cent basis. How much of that revenue would be apportioned to the Southern Pacific in the first place?

A. 50 per cent of it.

Q. How much of that revenue accruing to the Southern Pacific would be apportioned to the one-hundred-mile haul in Arizona?

A. One-fifth of it.

Q. Or one-tenth of the total revenue for the interline haul?

A. That is right.

Q. That one-tenth would appear where?

A. In column 3.

Mr. Strouss: That has been the formula in use since 1914?

A. Yes, sir.

Mr. Strouss: Of course that applies to freight movement [fol. 1920] out of the state as well as to those into it and going through it?

A. Yes, sir.

Mr. Strouss: In other words, shipments of ore out of Bisbee or Douglas, for example, the revenue from them would be interstate if it were going to El Paso or beyond?

A. That is true.

Mr. Strouss: And the amount of that revenue allocated to Arizona would be the ratio of the mileage in Arizona to the total mileage?

A. That is true.

Mr. Mason: Mr. Masson, while the formula became effective in 1915, have the accounts for the years preceding been stated in the same way?

A. Yes.

Mr. Strouss: You mean in the exhibit?

A. Yes.

Mr. Strouss: I wasn't asking that question for that purpose.

Mr. Mason: I don't think it makes any particular difference because after all whether the percentage is 95 or 94, it is still very substantial.

Mr. Strouss: I wasn't questioning him on that basis.

Mr. Mason: Mr. Masson, have you before you a statement in one sheet bearing title, "Southern Pacific Company-Pa-
[fol. 1921] cific Lines, Freight Revenues as Allocated to the State of Arizona in Accordance with Formulae Prescribed by Arizona Corporation Commission, September 23, 1914, Segregated between Specified Classes of Traffic, Calendar Years 1930 to 1939, Inclusive"?

A. Yes, sir.

Mr. Mason: May we have the statement marked as "Defendant's Exhibit No. 142" for identification?

The Court: It may be marked.

The Clerk: Defendant's exhibit No. 142 for identification.

Mr. Mason: Did you prepare or cause to be prepared this exhibit, Mr. Masson?

A. This exhibit was prepared under my supervision and at my direction.

Q. From what particular sources was it prepared?

A. It was prepared from the accounting records of the company. I want to point out that column 2 are the same figures as appear in column 2 of exhibit No. 141, which in turn appear in the annual report to the Corporation Commission of Arizona.

[fol. 1922] Q. And the figures in column 10, where do they appear?

A. They appear in column 4 of exhibit No. 141. I have taken the basic records in our office and broken down the interstate revenue to show the amount of revenue that is derived from and allocated to the state of Arizona, first from traffic originating without and ending within the state as shown in column 4. Next, the revenue from freight traffic originating within and ending without the state as shown in column 6. Next, the revenue from freight passing

through the state is shown in column 8. As I said, this segregation was the result from the basic records which are quite voluminous in our office and the columns 3, 5, 7, and 9 are computations that we made.

Q. From the figures on the face of the exhibit?

A. From the figures on the face of the exhibit.

Q. The percentage computations in column 3, I take it, correspond to and are the differences respectively between one hundred and the other figures appearing in column 5 of exhibit No. 141 for the corresponding years?

A. Yes, taking 6.90 per cent shown in column 3 for the year 1939 on exhibit No. 142 and adding it to the percentage of 93.10 shown in column 5 for the year 1939 on exhibit [fol. 1923] No. 141 comes to one hundred per cent.

Q. The same is true as to each of the other years down to 1930?

A. That is true. In other words, the 93.10 per cent has been broken down to show what is in and out and through the state.

Mr. Mason: Have you any questions, Mr. Strouss?

Mr. Strouss: No, I have no questions.

Mr. Mason: We offer the exhibit in evidence as defendant's exhibit No. 142.

Mr. Strouss: We object to it as irrelevant and immaterial.

The Court: Objection overruled, it may be admitted in evidence.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 142.")

Mr. Mason: I don't know that we developed from the witness that it was true and correct.

A. It is to the best of my knowledge and belief.

Q. And the computations have been checked, have they?

A. They have.

Q. As I understand exhibit No. 142, Mr. Masson, it simply carries further the breakdown into interstate and intra- [fol. 1924] state traffic and for the ten-year period only the showing made by exhibit No. 141?

A. That is true.

Q. Is this showing in column 8 and percentage reference in column 9, is that character of traffic sometimes referred to as "bridge" or "overhead" traffic?

A. Yes, in that instance Arizona would be known as a bridge state.

Q. Take an example of traffic originating at Los Angeles and moving to El Paso. Where would the Arizona proportion of the revenue received for the character of that shipment appear upon exhibit No. 142?

A. That would be in column 8.

Q. If the shipment originated in Tucson and moved to El Paso, where would the Arizona proportion of the revenue appear?

A. That would be in column 6, originating in and ending without.

Q. These shipments which originate at Los Angeles and move on the Overnight to Phoenix and Tucson and are delivered there, where does the revenue from them appear?

A. That would be in column 4.

[fol. 1925] Mr. Mason: Have you any questions before we leave the exhibit, Mr. Strouss?

Mr. Strouss: No.

Mr. Mason: Mr. Masson, have you before you a statement in one sheet bearing the title, "Southern Pacific Company-Pacific Lines, Revenue Ton-Miles of Freight Carried in the State of Arizona, Calendar Years 1925 to 1939"?

A. Yes.

Mr. Mason: May we have the statement marked as "Defendant's Exhibit No. 143" for identification?

The Court: It may be marked.

The Clerk: Defendant's exhibit No. 143 for identification.

Mr. Mason: Did you prepare exhibit No. 143 or cause it to be prepared?

A. I caused this exhibit to be prepared and it was prepared under my direction.

Q. From what sources was the exhibit prepared?

A. That was prepared from the basic records in our office.

Q. You say in the source note on the exhibit that it agrees with certain other statistics. Will you explain how it agrees or corresponds to such statistics?

[fol. 1926] A. The total shown in column 6 agrees with the corresponding figure that is shown in Schedule 931 of the annual report made by the company to the Corporation Commission of Arizona, 1939, for instance——

Q. Do you have the report to the Arizona Corporation Commission before you now?

A. Yes.

Q. And are referring to the 1939 figures in Schedule 931?

A. Yes, 1939 figures in Schedule 931. Line 73 shows the same figure as is shown in column 6 of Exhibit No. 143.

[fol. 1927] Q. For the year 1939?

A. For the year 1939. That figure was broken down from our basic records between intrastate and interstate.

Q. Now, the definition of intrastate is, as to the units shown here, the same as stated by you previously?

A. Yes, sir.

Q. And likewise the definition of "interstate"?

A. Yes.

Q. I notice that here you make the segregation of revenue ton-miles using as the unit the revenue ton-mile. Will you explain the use of that unit?

A. Well, a ton-mile is the transportation performed. In other words, the tonnage moved, and the distance that it moves is known by the technical term "ton-mile," one ton of two thousand pounds moved one mile is a ton-mile.

Q. Is that the measure of the freight transportation performed upon revenue freight?

A. Yes.

Q. And that is the measuring unit used by the commission, state commissions as well as by the Interstate Commerce Commission?

A. Yes.

Q. And by the carriers, of course, in rendering their re-

[fol. 1928] ports, by the Southern Pacific in rendering its report, at least?

A. That is a unit of measure that is generally used by all transportation agencies, rail transportation agencies, I should say, all railroads as well as by all regulatory bodies.

Q. Has the exhibit been compared with the original sources to determine its correctness?

A. Yes, sir.

Q. And the computations, the results of which appear in columns 3 and 5, just how were they made?

A. They were made and they were checked and are correct.

Q. Now, your note says "Interstate ton-miles assigned to state on basis of distance carried within or through the state." Does that involve the use of any formula?

A. What did you say?

Q. The Note A at the foot of the sheet says, "Interstate ton-miles assigned to state on basis of distance carried within or through the state."

A. Well, that is the same formula that I referred to, the revenue-mile.

Q. This is the case of actual performance, actual carriage?

[fol. 1929] A. Yes.

Q. There is no formula involved, is there?

A. None other than that which applies to revenue. In other words, the ton-miles assigned to the state are in ratio of the total miles in the state, moved in the state times the tonnage, to the total tonnage and total mileage.

Q. It is necessarily so, from the definition of the term "ton-miles?"

A. That is so.

Q. Is the segregation of the revenue ton-miles of freight as between interstate and intrastate a record currently maintained, or is it the result of a special study of the underlying records for the purposes of this case?

A. We don't maintain a segregation of ton-miles by states; it was made for—except as to Nevada; Nevada is the only state that requires it. We do that currently. The segregation here made was the result of the special study.

Q. Of the primary records?

A. Yes.

The Court: In other words, the Arizona Corporation Commission doesn't require such a report?

A. It doesn't require that report.

[fol. 1930] Mr. Mason: Have you any questions, Mr. Strouss?

Mr. Strouss: No. I think inadvertently Mr. Masson's definition of revenue ton-miles, he stated a ton—freight moving one mile. I think he meant revenue freight.

The Witness: Yes, we were speaking of revenue freight; otherwise, it would be revenue and non-revenue. But a ton-mile is 2,000 pounds of freight moved a mile.

Q. It wouldn't include company freight?

A. No, this doesn't include company freight.

Mr. Mason: We offer the exhibit in evidence as defendant's Exhibit No. 143.

Mr. Strouss: Objected to as irrelevant and immaterial.

The Court: The objection is overruled. It may be admitted in evidence.

(The document referred to was received in evidence and marked, "Defendant's Exhibit No. 143.")

The Court: We will take our morning recess at this time.

(Thereupon a short recess was taken, after which Mr. Masson was recalled to the stand and proceedings were resumed as follows:)

[fol. 1931] Mr. Mason: Mr. Masson, have you before you a statement in one sheet bearing the title, "Analysis of Interstate and Intrastate Revenue Freight Tons carried One Mile in State of Arizona, Calendar Years 1925, 1929, 1938 and 1939?"

A. Yes, sir.

Mr. Mason: May we have the statement marked "Defendant's 144 for identification?"

The Court: It may be marked.

The Clerk: Defendant's exhibit No. 144 for identification.

Mr. Mason: Did you prepare this exhibit, Mr. Masson, or have it prepared?

A. That statement was prepared under my supervision and direction.

Q. Was this statement especially prepared from the underlying records for the purposes of this case?

A. This was a special study from the underlying records in our office for the purposes of this exhibit.

Q. Do any of the figures appearing on the exhibit correspond with figures appearing in reports to the Arizona Corporation Commission?

A. Yes; as stated in the footnote there, the grand total shown in column 8 agrees with the totals shown in Column [fol. 1932] 6 of exhibit No. 143. This exhibit breaks down the ton-miles, or, in other words, the transportation service to correspond with the breakdown that is shown in exhibit 142. 142 covers the breakdown of the revenue and this shows the breakdown of the ton-miles between various sources as indicated in Column 1. You will note that Item D, freight originating and terminating within the state, intrastate freight, intrastate ton-miles I should say, agrees

with the corresponding figures for the respective years shown in Column 2 of exhibit 143.

The Court: I notice, Mr. Masson, in all of these other exhibits that have been introduced here this morning while you have been on the stand, that they either cover a ten-year period or a period from 1912 to 1939, whereas Exhibit 144 merely takes four years, 1925, 1929, 1938 and 1939. Why was that done?

A. Simply—this exhibit is intended and was constructed simply as an illustration of the transportation service in and out and through the state.

Q. Any particular reasons for taking those four years? [fol. 1933] A. No, there wasn't any particular reason. I assumed that it would serve the purpose of an illustration, and I had no reason to believe that any of the other years would produce any different figures.

Mr. Masson: That is, anything differing very widely from what appears here?

A. From what appears in here.

Q. Referring to exhibit 143, the segregation of the total interstate and intrastate, do you find any such substantial variations in the proportions during the years 1925 to 1939 which would indicate any substantial variations as between classes A, B and C on exhibit 144 for identification?

A. No; that is what caused me to simply use this as an illustration.

Q. Was this a special study requiring special references to the basic records?

A. Yes.

Q. Is it a considerable labor to segregate these figures for each year?

A. Yes, it is.

Q. Is that another reason for having confined it to the four years shown?

A. It is, yes.

[fol. 1934] Q. These figures in percentage of totals in the line bearing the designation "total interstate" for these years are the same as those which appear in Exhibit 143 in columns 4 and 5?

A. Yes.

Q. This is simply a further breakdown for these four years of the figures which appear in Exhibit 143, are they not?

A. That is true, that is the fact.

Mr. Mason: Have you any questions on the exhibit, Mr. Strouss?

Mr. Strouss: No questions.

Mr. Mason: Has the exhibit been checked against the underlying records, Mr. Masson?

A. Yes.

Q. And have the computations been checked?

A. They have.

Q. Will you say whether or not the exhibit is true and correct?

A. It is true and correct, to the best of my knowledge and belief.

Mr. Mason: We offer the statement in evidence as Defendant's Exhibit in evidence No. 144.

Mr. Strouss: Objected to as irrelevant and immaterial.

The Court: Mr. Strouss, I understood you to say earlier [fol. 1935] in the trial that the defendant company has been cooperative and made available all of their records for you, so you are not objecting on the ground that the original source records are not here?

Mr. Strouss: No, I am objecting only on the ground that it is immaterial and irrelevant.

The Court: The objection is overruled. It may be admitted.

(The document referred to was received in evidence, and marked "Defendant's Exhibit No. 144.")

Mr. Mason: Have you before you, Mr. Masson, a statement in one sheet relating to Southern Pacific Company, Pacific Lines, and bearing the title, "Tons of Revenue Freight Carried One Mile Through, And Or, To and From Points Within, State of Arizona, Segregated Between Traffic To and From Mexico and Traffic To and From All Other Points Beyond the State?"

A. Yes, sir.

Mr. Mason: May we have the statement marked as defendant's Exhibit 145 for identification?

The Court: It may be marked.

The Clerk: Defendant's Exhibit No. 145 for identification.

[fol. 1936] Mr. Mason: Did you prepare this exhibit or cause it to be prepared, Mr. Masson?

A. I caused this exhibit to be prepared; it was prepared under my supervision and direction.

Q. Is this likewise based upon original records of the company?

A. Yes, our basic records were used in preparing this, and here, again, we used only one year.

Q. Was this a special study for the purposes of this case?

A. It was.

Q. Requiring considerable labor?

A. Yes.

Q. As I understand it, the exhibit is for the purpose of showing the percentage of the international traffic from and to Mexico handled through Arizona for the year?

A. That is the primary purpose of the exhibit.

Q. Then this is a further breakdown of the 1939 figures appearing in the preceding exhibits?

A. Yes.

Q. Did you make these computations or percentage figures in column 3?

A. The computations were made at my direction.

[fol. 1937] Q. Have they been checked?

A. Yes, and I am satisfied they are correct.

Mr. Mason: Have you any questions, Mr. Strouss?

Mr. Strouss: As I understand it, this exhibit now, the items under "A" represent the traffic which passes through Arizona going either from Mexico to some points beyond Arizona or coming from points beyond Arizona into Mexico, but neither originating nor terminating in Arizona.

A. That is true, that is Item 1.

Mr. Mason: I think that that is not quite clear.

The Witness: Item 1 represents freight that originated or terminated in Mexico, passing through the state of Arizona to and from a point beyond Arizona. Item 2 represents all other traffic passing through Arizona.

Mr. Mason: Now, do I understand

The Witness (Interrupting): Do you understand that now?

Mr. Strouss: Yes.

The Witness: Item B. is the traffic to and from points in Arizona to Mexico, and vice versa.

Mr. Mason: Now, the first two entries, then, numbers 1 [fol. 1938] and 2, is traffic, either Mexican traffic or domestic United States traffic, as to which Arizona is a bridge?

A. Yes.

Q. And Items 3 and 4, and B is domestic traffic, or traffic from or to Mexico, moving to or from points in Arizona?

A. Yes.

Q. But all interstate?

A. It is all interstate traffic.

Q. This contains no showing of any intrastate Arizona traffic?

A. No.

Mr. Mason: Any other questions, Mr. Strouss?

Mr. Strouss: No other questions.

Mr. Mason: We offer the exhibit in evidence as defendant's Exhibit 145.

Mr. Strouss: Objected to as irrelevant and immaterial.

The Court: The objection is overruled. It may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 145.")

Mr. Mason: Will you now refer, Mr. Masson, to a statement in one sheet entitled, "Southern Pacific Company, [fol. 1939] Pacific Lines. Passenger Revenues Within the State of Arizona, Years 1912 to 1939 Inclusive."

A. Yes, I have it before me.

Mr. Mason: May this be marked, if the Court please, No. 146 for identification?

The Court: It may be marked.

The Clerk: Defendant's Exhibit No. 146 for identification.

Mr. Mason: Did you prepare No. 146, or cause it to be prepared, Mr. Masson?

A. I caused that exhibit to be prepared, and it was prepared under my supervision and direction.

Q. And prepared from the counterpart copies of the annual reports to the Corporation Commission of Arizona?

A. Yes.

Q. The Schedule 710 as shown?

A. Yes, or corresponding schedule.

Q. Does this exhibit bear any resemblance to Exhibit 141?

A. Yes, that is a breakdown of the passenger revenues as between intrastate and interstate in a manner and according to formula similar to that which applies to freight revenues as shown in Exhibit 141.

[fol. 1940] Q. Is the exhibit prepared exactly the same way?

A. Yes.

Q. And the allocation or prorating of interstate passenger revenue to the State of Arizona is accomplished according to formula along the same lines for the assignment or allegation of freight revenue?

A. Yes.

Q. The computations in column 5, I take it, are your computations?

A. Yes, computed for the purpose of this exhibit.

Q. And express the relationship of what other figures on the exhibit?

A. Express the relationship of column 3 and column 4, indicating the predominances of revenue from interstate business within Arizona.

Mr. Mason: Have you any questions on the exhibit, Mr. Strouss?

Mr. Strouss: No, I just have one.

Q. These exhibits include branch line operations as well as main line?

A. Yes, the total revenues.

Mr. Mason: Has the exhibit been compared and checked?

[fol. 1941] A. Yes, sir.

Q. Will you say whether it is true and correct?

A. To the best of my knowledge and belief, it is.

Mr. Mason: We offer the exhibit in evidence as defendant's Exhibit No. 146.

Mr. Strouss: Objected to as irrelevant and immaterial.

The Court: The objection is overruled. It may be admitted.

(The document referred to was received in evidence, and marked "Defendant's Exhibit No. 146.")

Mr. Mason: Will you refer, please, Mr. Masson, to a statement in one sheet entitled, "Southern Pacific Company, Pacific Lines, Revenue Passengers carried One Mile in the State of Arizona, Years 1925 to 1939, Inclusive?"

A. Yes, sir.

Mr. Mason: May we have the statement marked "Defendant's No. 147 for identification," Your Honor?

The Court: It may be marked.

The Clerk: Defendant's Exhibit No. 147 for identification.

[fol. 1942] Mr. Mason: Did you cause this exhibit to be prepared, Mr. Masson?

A. Yes, sir.

Q. Was this prepared as a special study from basic records of the company?

A. Yes, sir.

Q. Here you have a showing of revenue passengers carried one mile. Is that usually so-called "revenue passenger-miles?"

A. That is what it is.

Q. What is the revenue passenger-mile; is that a unit of measurement?

A. A passenger-mile is the measuring unit applied with respect to passenger statistics and represents—it is made up, or, I should say, it is one passenger traveling one mile, which is known by the technical term of the "passenger-mile."

Q. These figures in columns 2, 4 and 6 are passenger-miles?

A. Are passenger-miles. Column 6 ties into the annual report to the Commission, the Corporation Commission of Arizona.

Q. Does this exhibit resemble Exhibit 143 relating to the showing of revenue freight ton-miles?

[fol. 1943] A. Yes, to the extent that it segregates——

The Court: Comparing the two exhibits, Mr. Masson, I notice that on percentage bases, that the intrastate passenger business is considerably smaller than the intrastate freight business?

A. That is true, Sir. You will notice the falling off in the more recent years, which is due to the loss of passenger business.

Mr. Mason: I will ask you if the exhibit has been compared and the computations checked?

A. Yes.

Q. Is it a true and correct reflection of the underlying sources, the records to which you have referred?

A. To the best of my knowledge and belief, it is.

Mr. Mason: Have you any questions on the exhibit, Mr. Strouss?

Mr. Strouss: No questions.

Mr. Mason: We offer the exhibit as defendant's No. 147.

Mr. Strouss: Objected to as irrelevant and immaterial.

The Court: The objection is overruled. It may be admitted.

(The document referred to was received in evidence, and [fol. 1944] marked "Defendant's Exhibit No. 147.")

Mr. Mason: Attention has been called, Mr. Masson, to the decline in the intrastate proportion of the revenue passenger business expressed in revenue passenger-miles, as indicated on the face of the exhibit. Is that due to the disappearance or partial disappearance of local passenger traffic, short haul passenger traffic?

A. Yes. Now, when I say that these figures, revenue figures especially, tie into the annual reports, I want to point out that for the purposes of this exhibit the revenue is rounded out in dollars. Of recent years reports have been rendered to the Commission in round dollars; in other words, cents were omitted. In prior years, why, we reported dollars and cents, so to that extent there will be that small difference.

Q. That comment would not apply to Exhibit 147, would it?

A. No, no; there is no money; wherever money is shown, it was rounded out.

Mr. Mason: Have you any questions on the exhibit, Mr. Strouss?

Mr. Strouss: This is 147?

[fol. 1945] Mr. Mason: 147, yes. It has been received.

Mr. Strouss: No, I have no questions on it.

Mr. Mason: Have you before you, Mr. Masson, a statement in one sheet bearing the title, "Analysis of Interstate and Intrastate Revenue Passengers Carried One Mile In State of Arizona, Calendar Years 1925, 1929, 1938, and 1939"?

A. Yes.

Q. Did you cause this exhibit to be prepared?

A. I did.

Q. From basic records in the accounting department of the company?

A. Yes.

Q. Was this a special study for the purposes of this case, similar to Exhibit No. 144, in which you analyzed the revenue freight ton-miles?

A. Yes; and again we used only four years.

The Court: And the same four?

A: And the same four, which is simply for the purpose of illustrating the source of the business.

Mr. Mason: Here you have broken down, I take it, the figures appearing on No. 147, so as to show the interstate movement into the state, out of the state, and across the state.

A. Yes; 147 is revenue.

[fol. 1946] Q. Is 147 revenue?

A. No, no. That is right. Yes, you will notice that the grand total here, column 8, for the year 1939, ties into the figure shown in column 6 for 1939.

Q. On Exhibit 147?

A. On 147.

Q. Is the same true as to the figures for 1925, 1929, and 1938?

A. Yes.

Q. Have the computations been checked and the exhibits otherwise compared to determine its correctness?

A. Yes, it has been checked, and it is correct to the best of my knowledge and belief.

Mr. Mason: Have you any questions, Mr. Strouss?

Mr. Strouss: No, I have no questions.

Mr. Mason: We offer the statement as defendant's Exhibit No. 148.

Mr. Strouss: Objected to as irrelevant and immaterial.

The Court: The objection is overruled. It may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 148.")

[fol. 1947] Mr. Mason: Attention has been called, Mr. Masson, to the fact that this exhibit shows only four years. Is the preparation of the segregation appearing on this exhibit a somewhat detailed and laborious process?

A. It is quite a detailed and exhaustive process to go through and pick out this stuff from our records.

Q. Is that the reason why no more than four years are shown?

A. Primarily, yes. And also, it was my thought that four years would be sufficient, would answer the purpose of illustrating just the source of the business. I had no reason to believe but that the same showing would result if other years were analyzed in the same way.

Q. Will you take up, next, the statement in one sheet entitled "Statistics of Rail-Line Operations Within the State of Arizona. Main Line and Branches, Excluding Mixed Service, Years 1910 to 1939, Inclusive. Freight Trains." Have you that before you?

A. Yes.

Mr. Mason: May we have this statement marked as Defendant's Exhibit No. 149 for identification?

The Court: It may be marked.

[fol. 1948] The Clerk: Defendant's Exhibit No. 149 for identification.

Mr. Mason: Did you prepare No. 149, or cause it to be prepared?

A. I caused this exhibit to be prepared. It was prepared under my supervision and direction, and it is taken from the annual reports to the Corporation Commission of Arizona. The books for 1922 to 1939 are in the courtroom and 1910 to 1921, inclusive, will be furnished if the attorney requires them.

Mr. Strouss: No, we have them in the Corporation Commission.

Mr. Mason: Are all of these figures those which appear on the several reports to the Corporation Commission?

A. Excepting column 4.

Q. Is that a computed figure?

A. That is a computed figure.

Q. What does column 4 represent?

A. Column 4 represents average cars per train.

Q. What computation do you make in obtaining it?

A. You divide column 3 by column 2.

Q. So that the figures in column 4 are in fact the average car-miles per train-mile.

[fol. 1949] A. Average car-miles per train-mile, and they include everything but mixed trains.

Q. This also covers branch-line as well as main line operations.

A. Branch line and main line, short trains and long trains.

Q. The showing for the years, subsequent to 1924, as in preceding exhibits, includes the separately operated companies which were acquired in 1924?

A. Yes. Those companies, of course, were operated as part of the Pacific Lines.

Q. Subsequent to November first or approximately that date in 1924?

A. Yes.

Q. Has the exhibit been compared as to the original figures, and checked as to the computations?

A. Yes.

Mr. Mason: Have you any questions, Mr. Strouss?

Mr. Strouss: The average cars per train is the calculation?

A. Yes.

Q. Considering columns 2 and 3?

A. Yes, as I explained, it is simply a division of column [fol. 1950] 3 by column 2, or in other words, this is the car-miles per train-mile.

Mr. Strouss: No other questions.

Mr. Mason: Is the exhibit true and correct, Mr. Masson?

A. Yes, to the best of my knowledge and belief.

Mr. Mason: We offer the statement as Defendant's Exhibit No. 149.

Mr. Strouss: I object to it as irrelevant and immaterial.

The Court: The objection is overruled; it may be admitted.

(The document referred to was received in evidence and marked, "Defendant's Exhibit No. 149.")

Mr. Mason: Have you before you, Mr. Masson, a statement in one sheet bearing the title, "Statistics of Rail-Line Operations Within the State of Nevada, Main Line and Branches, Excluding Mixed Service, Years 1910 to 1939, Inclusive"?

A. Yes.

Mr. Strouss: Pardon me just a minute. May I ask one question concerning that previous one?

Mr. Mason: Yes.

Mr. Strouss: Does that include mixed trains or just straight freight trains?

A. No, freight trains, as indicated at the top of this [fol. 1951] sheet. In the heading it says "Excluding Mixed Service," and, as you probably know, the classification "mixed service" is no longer in effect.

Mr. Strouss: When I said I didn't want those reports, I do want to examine these reports from 1922 on.

The Witness: Yes, that is understood.

Mr. Mason: That is understood.

Q. I notice here on exhibit 149, Mr. Masson, a matter which may merit explanation. You show statistics for 1910 and 1911, which, of course, are prior to the existence of the Corporation Commission in the State of Arizona. Were those figures, for Arizona as a territorial unit, kept in the company's records prior to that time?

A. The figures are, of course, and have been back as far as I can remember, kept as part of the company records. These figures were taken from reports to the Corporation Commission to the State of Arizona or a report made to some other commission, of which I haven't the information right now.

Q. Its predecessor in territorial days?

A. Yes.

Mr. Mason: I take it, Mr. Strouss, that there is no ques- [fol. 1952] tion as to the authenticity, if it be material, of the figures for 1910 and 1911?

Mr. Strouss: No.

Mr. Mason: Now, referring to the statement which has been circulated and relates to the State of Nevada, the title of which I believe I recited, may we have that marked, if it has not already been marked, as defendant's exhibit 150.

The Court: It may be marked.

The Clerk: Defendant's exhibit No. 150 for identification.

Mr. Mason: Did you prepare exhibit No. 150 for identification, Mr. Masson?

A. I had this prepared.

Q. From what sources?

A. That was prepared from the reports to the Public Service Commission of Nevada back to 1911, inclusive, and 1910 was taken from our company records. We have the reports from 1922 to 1939 in court, the reports to the Nevada Commission in court. If the counsel wants reports from 1910 to 1921, inclusive, they will be made available to him.

Mr. Strouss: No, I will be satisfied with 1922 to 1929.

[fol. 1953] Mr. Mason: Mr. Masson, this exhibit is similar in form apparently to exhibit No. 149, the only difference being that it relates to Nevada rather than to Arizona operations?

A. That is true.

Q. The figures in column 4 represent the quotient of the division of the figures in column 3 by those in column 2?

A. Yes, those are computations.

Q. Includes all branch line operations as well as main line operations?

A. Yes, sir.

Q. And excludes mixed service as that is reported separately?

A. Yes, sir.

Mr. Mason: Have you any questions, Mr. Strouss?

Mr. Strouss: No questions.

Mr. Mason: Has the exhibit been compared and checked, Mr. Masson?

A. Yes.

Q. Will you say whether or not it is true and correct to the best of your knowledge and belief?

A. It is true and correct to the best of my knowledge and belief.

Mr. Mason: We offer the statement in evidence as de-
[fol. 1954] fendant's exhibit No. 150 with the explanation of course that as part of our case in chief we desire and propose to make comparisons between Arizona and Nevada operations and this is one of the features of that comparison.

Mr. Strouss: It is objected to as irrelevant and immaterial and particularly pointing out to the court that it relates to operations without the state of Arizona and there has been no proper foundation laid and no showing of similarity.

The Court: Objection overruled, it may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 150.")

Mr. Strouss: Of course I assume the court will adhere to the ruling which was mentioned the other day of requiring a similarity be shown before the defendant's case is completed.

Mr. Mason: I take it that the question whether a comparison when offered is to be made the foundation of any findings or decision depends of course upon a showing of similarity of conditions. If conditions are not shown to be reasonably similar, then the comparison loses its force and I think that is the extent of the objection. It is an objection [fol. 1955] more to weight than to sufficiency.

Mr. Strouss: It goes further than that, it goes to the admissibility of the evidence. As we have pointed out to the court heretofore, in the reverse order of proof which we have taken in this case the opportunity of the State to argue its objection based upon the record is not here because of the fact that they have chosen and elected to come in the back door instead of the front door, and all we can do is make our objection and of course the court permitting that order of proof we will have to wait to see what the final record is as made.

Mr. Mason: I will say this, from the face of these two exhibits, 149 and 150, it is possible and I think desirable at this point to indicate a similarity. Now, of course, car-miles or revenue freight ton-miles are a measure of the volume of revenue freight in the respective territories, and from an examination of column 3 it will be seen that the volume of revenue freight handled measured in car-miles in the several years in the states of Arizona and Nevada are reasonably close together and in some years very close together. In some years the volume in one state is heavier than the other, but the two are not so far apart in any year. [fol. 1956] So that the company's operations in the two states from the standpoint of volume of revenue freight handled may properly be held to be comparable. I realize

this is arguing the case at this point but I point out that column 3 does indicate a similarity from that standpoint.

Mr. Strouss: Whether they are comparable or not remains to be seen when all the evidence is in. There are a number of elements which will enter into that question when the matter comes to a final issue.

Mr. Mason: I think Mr. Strouss will agree with me that the volume of traffic to be handled is one of the elements to be considered.

The Court: You may proceed, gentlemen.

Mr. Mason: Have you anything further on No. 150, Mr. Masson?

A. No, I don't think so.

Mr. Mason: Before we pass to another exhibit, Mr. Strouss, have you any questions you would like to ask now on that exhibit?

Mr. Strouss: No, I have not.

Mr. Mason: Have you before you, Mr. Masson, a statement in one sheet entitled, "Southern Pacific Company, Pacific Lines, Freight Operating and Freight Transporta-
[fol. 1957] tion Expenses Related to Traffic, Calendar Years 1922 to 1939, Inclusive"?

A. Yes.

Mr. Mason: May we have the statement marked "Defendant's Exhibit No. 151" for identification?

The Court: It may be marked.

The Clerk: Defendant's Exhibit No. 151 for identification.

Mr. Mason: Did you prepare Exhibit No. 151 for identification or cause it to be prepared, Mr. Masson?

A. I caused this exhibit to be prepared and it was prepared under my supervision and direction. As shown in the footnote, the figures were taken from annual reports to the Interstate Commerce Commission; from the records of the company to and including 1935, and thereafter all of them came from the annual reports to the Interstate Commerce Commission. In other words, column 2 comes from the reports to the Interstate Commerce Commission in all years. Columns 3 and 4, from 1922 to and including 1935, were taken from the records of the company. We have those records in the court room. We have the reports to the Interstate Commerce Commission in the court room. Columns 5 and 6 are computations. All of the data shown

on this exhibit have been spot-checked by me, and I believe [fol. 1958] all of the figures to be true and correct.

Q. The totals and comptuations shown in the last three blocks of the exhibit are computed figures, are they?

A. Those are computed figures.

Q. Made by the summation of the figures for the years to which they relate?

A. That is true.

Q. And computations are as appear at the foot of the exhibit?

A. That is true.

Q. You speak of percentage of improvement and so forth. Does that mean a percentage decline as between the figures compared?

A. Yes, that means a reduction in the average cost expressed percentage-wise.

Q. And the percentage of improvement is arrived at, I take it, by subtracting the smaller figure from the larger and dividing the difference by the larger figure?

A. That is true.

Mr. Mason: Have you any questions on the exhibit, Mr. Strouss?

Mr. Strouss: When you say "expenses related to traffic," you mean by showing the cost per thousand revenue ton-miles?

[fol. 1959] A. That is true.

The Court: Mr. Masson, will you distinguish for the court what you mean by the freight operating expenses as distinguished from the freight transportation expenses?

A. Operating expenses are incurred for maintenance of way, maintenance of equipment, traffic, transportation, and general expenses. Those general classes of expenses are caused by freight and passenger operations. The total expenses incurred in one class of freight service, for instance, or in passenger service where directly incurred in connection with those particular services are allocated directly to that class of service. Where the expenses cannot be allocated direct of assigned direct to either one or the other service, they are broken down according to a formula between the two services, a formula that has been provided and prescribed by the Interstate Commerce Commission. Column 3 represents, therefore, the expenses that have been incurred in conducting freight service and were

assigned directly to that service, plus a proportion of what we know as common expenses that cannot be assigned to either one or the other service.

Mr. Strouss: That is, you mean, either pasenger or [fol. 1960] freight?

A. Either passenger or freight service.

Mr. Mason: You mean assigned solely to either service?

A. That is true.

The Court: Such as maintenance of right of way?

A. Maintenance of way, although there are some facilities that are classified exclusively as freight facilities in the maintenance of which the expenses are assigned directly to freight service. Therefore, this column 3 represents the freight proportion assigned and allocated to maintenance of way, maintenance of equipment, traffic, expenses, transportation, miscellaneous services, if any, and general expenses. Column 4, on the other hand, is just a part of the expense. It is the expense that is incurred directly in connection with the transportation service, such as train service, the superintendence of train service, the dispatching, the station service, the wages of enginemen and trainmen, and things of that kind.

The Court: Are the items shown in column 4, for instance, for the year 1939, forty-five million, is that included [fol. 1961] within and a part of the total shown in column 3?

A. Yes, sir, it was the intent and is the intent of this exhibit to show first what total expenses cost us per thousand revenue ton-miles. Next, as a side issue, but on the same exhibit, how much of that represents transportation expenses per thousand ton-miles.

Mr. Mason:

Q. When you say "total expense," you mean the total of freight operating expense?

A. Yes, I was speaking of only the freight proportion of operating expenses.

Q. Do you recall exhibit No. 20 introduced by the witness Parmelee relating to railroads of Class I of the United States?

A. Yes.

Q. And exhibits introduced through witnesses for other railroads similar in form to exhibit No. 20?

A. Yes.

Q. Will you say whether or not exhibit No. 151 for identification resembles and is intended to present statistics for the Southern Pacific lines in the same fashion as exhibit No. 20 for railroads of the United States as a whole?

A. Exhibit No. 151 is of the same substance as the exhibit presented by Mr. Parmelee and representatives of [fol. 1962] other lines except that it deals exclusively with the ton-miles and expenses of the Southern Pacific lines only.

Q. It is in the same form and presents statistics which correspond to those shown on the other exhibits?

A. That is true.

Q. Of which exhibit No. 20 is typical?

A. That is right.

Mr. Mason: Have you any questions, Mr. Strouss?

Mr. Strouss: Those freight operating expenses and freight transportation expenses are allocated according to the requirements of the Interstate Commerce Commission, are they not?

A. Yes.

Mr. Strouss: And the amounts shown in column 3 freight operating expense includes all items or accounts beginning with account 201 and ending with account 464 of the annual reports to the Interstate Commerce Commission?

A. 462. It represents the freight proportion of expenses that have been charged to the primary accounts within that range of numbers that you spoke of, 201 to 462. Of course, you understand there are several accounts within that [fol. 1693] range that we have no charges in.

Mr. Strouss: Wherever there is an expense in an account within that range, it is included within this total?

A. Yes.

Q. This total would be the over-all total of all those accounts where you have charges to any account?

A. Yes, as you will notice, take the year 1939 and refer to Schedule 320 of the annual report to the Interstate Commerce Commission for the year 1939, line 247, column E is the exact figure that is reproduced in this exhibit, column 3.

Q. In defendant's exhibit No. 9, there is a typical annual report?

The Court: That is true.

Mr. Mason: Exhibit No. 9 was a blank annual report?

A. Yes, form A.

Mr. Strouss: Freight transportation expenses as shown in column 4 here is the total of accounts 371 to 420 for each year wherever there are charges to that account?

A. That is true, and you will notice, taking 1939 for instance, the figure as shown in Schedule 320 of the Interstate Commerce Commission report, line 215 on page 311 shows [fol. 1964] in column E the exact figure that is shown as reproduced in exhibit No. 151.

Q. Of course that form has been changed somewhat in recent years?

A. Over the period of years there have been several changes.

Q. So far as this allocation of charges to freight and passenger, it is set up differently now than it was eight or ten years ago?

A. There have been modifications. The separation between freight and passenger was originally prescribed by the Interstate Commerce Commission entitled, "Rules Governing the Separation of Operating Expenses between Freight Service and Passenger Service on Large Steam Railways Effective January 1st, 1920."

Mr. Strouss: The point I was trying to show was that you referred to column E which gives you a total of the charges to freight when in the older annual reports it was necessary to add two different columns to get that.

A. That is very true and when I gave the reference I referred particularly to 1939.

Mr. Mason: These figures in column 4, are those the expenses that are particularly associated with the actual [fol. 1965] operation of the trains as distinguished from maintenance or traffic expenses?

A. Yes, it includes the operation of trains, main line and branches, road and yard.

Q. It includes, I think you said, the cost of the wages of the men who are actually manning the trains?

A. Yes.

Q. And the fuel for the train locomotives?

A. Yes.

Q. And other expenses which are particularly associated with the movement of the trains, is that correct?

A. Yes, along with other direct transportation expenses.

The Court: Are you offering this exhibit in evidence?

Mr. Mason: Yes, Your Honor, we offer the exhibit in evidence as exhibit No. 151.

Mr. Strouss: I object to it as irrelevant and immaterial.

The Court: Objection overruled, it may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 151.")

The Court: We will recess at this time until 2 P. M.

[fol. 1966] January 8, 1941, Two o'clock P. M.

Proceedings were resumed at this time as follows:

The Court: You may proceed. Will the witness who was on the stand resume the stand?

Mr. Strouss: I think they wanted me to take Mr. Mahoney.

Mr. Mason: If it is convenient to Mr. Strouss, he is ready to proceed with the cross-examination of Mr. Mahoney.

J. J. Mahoney, was recalled to the stand, and testified further as follows:

Cross-examination.

By Mr. Strouss:

Q. Mr. Mahoney, you were testifying concerning the consists of your passenger trains. Your published schedules for use of the public show the consists, do they not?

A. Yes, they are included in the passenger train folder and, in addition thereto, we have our consist, which is prepared in my office that shows the consists of trains, and they vary from time to time as certain lines are added to the [fol. 1967] passenger trains, or discontinued. There are time that do not conform with the folder. However, the circu that I issue from my office is up to date and corrected at all times.

Q. Do you have that with you?

A. I don't happen to have one of those with me.

Q. This is one of your folders for the use of the public, is it not?

(Mr. Strouss hands a folder to the witness.)

A. That is for the Coast Lines.

Q. For the Coast Lines, yes.

A. Yes, sir.

Q. That would show the trains eastbound as they leave the coast, the consists of the trains?

A. Yes, that would be about correct, now. That would be December 22, 1940.

Q. Will you take that and give the consists of the trains that are shown in your exhibit?

A. Number 2, the Scout, in the last block under "East," lounge car, Los Angeles to Chicago, three tourist sleepers, Los Angeles to Chicago, an additional tourist sleeper, Los Angeles to Chicago, on Sundays, Tuesdays, Thursdays and Saturdays; additional tourist sleeper, Los Angeles to Chicago, via the Carlsbad Cavern. That car cuts out at Clovis, [fol. 1968] New Mexico. An additional tourist sleeper, Oakland to Chicago, which is picked up by Train No. 2 at Barstow, California, on Mondays, Wednesdays and Fridays; an additional tourist sleeper, Los Angeles, to Kansas City, dining car, Los Angeles to Chicago, chair car Oakland to Kansas City, two cars, two chair cars; Los Angeles to Chicago, chair car for women and children only. I might add that that is the normal consist, and that if it requires additional chair cars or additional tourist sleepers, why, they are added.

Q. That is true of each of the trains?

A. Yes.

Q. The consists as shown here with respect to each of those trains?

A. The normal consists. I might say this, Mr. Strouss: In the summer time, or summer months, the normal consist of that train is four light weight chair cars in addition to the light weight chair car for women and children only.

Q. That is eastbound?

A. Yes. And that is also out of Chicago. I might say this, to make it clear to you, that the consists of the trains from Chicago and from Los Angeles correspond in practi- [fol. 1969] cally all trains, and we use six sets of equipment

in each assignment, that is, the train and its companion train.

Q. So that when these consists are given on the eastbound train, then the westbound train consists would correspond?

A. That is correct.

Q. Would that be true——

A. (Interrupting:) With this exception, that we may occasionally have one car more to take care of the traffic as it comes east, or have an extra car going west that may not come back in the companion train.

Q. Or it is possible that on westbound trains you would have some additional cars, Chicago to Denver, or to Colorado points?

A. Yes, and we may have additional cars clear through to California.

Q. I mean, you are more apt to have as a regular thing, and you do have, don't you, on the Californian, for example, sleepers from Chicago to Denver that are dropped off at La Junta?

A. That is correct.

Q. All-right. Now, if you will give the consists for the rest of them.

A. No. 4, California Limited: standard Pullman from Los Angeles to Denver, tourist sleeper, Los Angeles to [fol. 1970] Denver, chair car, Los Angeles to Denver,——

Mr. Mason: What page of the folder are you reading from, Mr. Mahoney?

A. Page 15.

Mr. Strouss: Page 9, isn't it?

The Witness: But that doesn't look to me like a complete consist of that train.

Q. Look at page 9.

A. Yes, I think this is it. May we strike that and start over.

The Court: It may be stricken.

A. Lounge car, Los Angeles to Denver, or lounge car to Chicago, Los Angeles to Chicago, sleeping car, Los Angeles to Chicago, sleeping car, Los Angeles to Chicago, sleeping car, Los Angeles to Denver, sleeping car; Oakland to Chicago, sleeping car, Los Angeles to Phoenix.

Mr. Strouss: Where does that cut out, at Cadiz?

A. Cadiz. Tourist sleeper, Los Angeles to Denver, Chair car, Los Angeles to Chicago, Chair car, Los Angeles to Denver, dining car, Los Angeles to Chicago. That is the consist of No. 4. No. 8 is the companion train to No. 7, our mail and express train. That train, the consist of that [fol. 1971] train, is governed exclusively by the number of cars of express and mail, as we handle only that rider, as we call it, which is a baggage compartment car, with seating capacity for sixteen people.

Q. The rest of the train is made up of baggage and mail?

A. Yes; so the consist of that train varies from day to day.

The Court: Is that your fast mail train?

A. Yes, Your Honor, that is the mail train east, companion train to No. 7, the mail train westbound. No. 20: Club lounge, Los Angeles to Chicago, Club baggage, Los Angeles to Chicago, four sleeping cars, Los Angeles to Chicago, sleeping car, Los Angeles to Kansas City, sleeping car, Phoenix to Chicago, which is picked up at Ashfork, and a dining car, Los Angeles to Chicago.

Mr. Strouss: I believe you passed 18, which is on the same page there.

A. Yes, No. 18, that is the Super-Chief: Club lounge, Los Angeles to Chicago, club baggage, Los Angeles to Chicago, four sleeping cars, Los Angeles to Chicago, and a dining car, Los Angeles to Chicago. The El Capitan is also a [fol. 1972] streamline, Diesel powered train

Q. I notice, Mr. Mahoney, that on what you just read was Tuesday equipment. I notice on Friday equipment you have one additional sleeper on the Super-Chief. Is that correct?

A. Yes, that is correct; yes, that is shown here on the same page. Is 22 in this thing?

Mr. Mason: Yes, 22 is on page 8.

Mr. Strouss: It is right across the page, the first one.

The Witness: (Continuing) Baggage dormitory, dormitory chair car, Los Angeles to Chicago, two chair cars, Los Angeles to Chicago, lounge counter dining car, Los Angeles to Chicago, chair car, Los Angeles to Chicago, chair observation car, Los Angeles to Chicago. I might say this, Mr. Strouss, that that is the normal consist, but Friday, Decem-

ber third, we ran that train with fourteen cars. They vary from day to day, and especially during seasons like the holiday season we run it as high as fourteen cars, and likewise out of Chicago, Sunday, the fifth of this month we had a fourteen-car train.

Q. Of course, that was true of all of your trains, that you add cars when traffic demands it?

[fol. 1973] A. That is true. Now, we need the Grand Canyon Limited.

Q. That is on page 10.

A. Lounge car, Los Angeles to Chicago, sleeping car, Los Angeles to Chicago, sleeping car, Los Angeles to Chicago, via the Grand Canyon, sleeping car, Oakland to New Orleans, which car is picked up at Barstow, another sleeping car.

Q. Where is that cut out?

A. Clovis, New Mexico.

Q. Another sleeping car, Los Angeles to Chicago. We have another sleeper that we pick up at Ash Fork that goes to Winslow, a tourist sleeper, Los Angeles to Kansas City, another tourist sleeper, Los Angeles to Chicago, via the Grand Canyon, a dining car, Los Angeles to Chicago, chair car, Los Angeles to Chicago. I might add, that this consist doesn't show it, but we do have a smoker chair car in that train, which we convert into a Jim Crow car by inserting partitions in Oklahoma and Texas, as we pass through; and in addition to these consists, with the exceptions of the Super Chief and the El Capitan, is your head-end baggage cars that we do not show in these consists, we may have one [fol. 1974] mail car or one baggage car that are not shown in the passenger folder.

Q. Will you state what is the usual consist so far as baggage or head-end cars is concerned?

A. Generally one car used as a buffer between the locomotive and the passenger-carrying cars. I would say that is generally. Sometimes we have maybe a working mail car and a storage car on some trains.

[fol. 1975] Mr. Strouss:

Q. Mr. Mahoney, yesterday you were asked concerning the type of traffic or principal commodities which are moved on the Santa Fe. Did you hear Mr. McDonald's testimony?

A. Yes.

Q. You heard him testify as to the annual reports and the different commodities that are moved as shown by the annual reports?

A. Yes.

Q. He read into the record the tons of different commodities like products of agriculture and the like?

A. It was the number of cars, wasn't it?

Q. It may have been the number of cars but anyhow that was put in by an exhibit or by reading into the record from Mr. McDonald's testimony?

A. Yes, sir.

Q. That does show the different types of traffic or the commodities that are moved on your road, does it not?

Mr. Mason: Just a moment, I call the court's attention to the fact that my question of this witness related to the predominant traffic carried on the main line and I think I addressed myself particularly to the main line across Arizona. If there is any attempt here to try to impeach Mr. McDonald [fol. 1976] by this witness or impeach this witness by referring to Mr. McDonald's showing, I respectfully submit that the cross examination is not proper, there isn't any consistency.

Mr. Stronss: I am merely trying to find out whether there is or is not.

The Court: Objection overruled, you may proceed.

Mr. Stroiss: Were you testifying to the same matter that Mr. McDonald testified to?

A. As I understood Mr. McDonald's answer to the question, he gave the total cars handled and then he broke that down as between perishable products and agricultural products.

Q. As I remember his testimony, he gave the total of the different types like products of mines and products of agriculture and then broke down the products of agriculture in an exhibit, that is correct, isn't it?

Mr. Booth: The exhibits were in the form of photographic copies of the reports of Schedule 544, reports to the Interstate Commerce Commission and the corresponding schedules and the reports to the New Mexico and Arizona commissions for the year 1939, but in the first case that was a system showing and in the other two cases those were all

[fol. 1977] cars moving within those states on the main line branch within those periods.

Mr. Mason: Pages 4856 and 1857 of yesterday's transcript show that Mr. Mahoney didn't undertake to give any figures but merely mentioned in answer to my question some of the principal commodities handled in eastbound movement within or across Arizona upon main lines and a general description of the commodities moving westbound on the main lines which cross the state of Arizona.

Mr. Strouss: I will ask you now if the matter testified to by Mr. McDonald showed the commodities which are moved both east and west over your lines?

A. Yes, that is correct, the commodities he mentioned move in both directions.

Mr. Strouss: I am a little bit foggy on this perishable schedule. I understood you to testify, take the California schedule, that begins from the point of concentration?

A. Yes. I want to say this, Mr. Strouss, that the basic schedule that is undertaken by all lines operating in the West is based upon departing from one of the five California concentration points, namely, Colton, San Bernardino in southern California, Bakersfield, Roseville, and Sacramento in northern California.

[fol. 1978] Q. What I am trying to reconcile is your testimony as I understood it, that the schedule begins at the point of concentration, say, Bakersfield?

A. All schedules are predicated upon a three A. M. departure from those five points.

Q. Let me finish my question and you will see what I am getting to. Then I understood you to testify that the 139-hour schedule applied to the whole of the state of California?

A. That is correct insofar as the Santa Fe railroad is concerned. That is correct with traffic originating on our own rails and I further stated that traffic originating on connecting line rails that reached our junction that would permit such traffic arriving at our concentration points prior to 7 P. M.

Q. That is before the the run-off time had expired?

A. Yes.

Q. We will take it a step at a time. I am probably a little dense on this and would like to be straightened out. You say this is applied for the whole state of California. Suppose, using Bakersfield as a concentration point and taking a

particular car which is out of some point, say, 25 or 30 miles from there, must that car be in Bakersfield before the run-[fol. 1979] off time has expired in order to come on that day's schedule?

A. That is correct.

Q. From an outlying point the car must be brought into Bakersfield in order to be brought into that day's schedule?

A. That is correct.

Q. You say cars loaded the previous day, the basic schedule would begin at 3 A. M. That would mean that the car would have to be loaded, loading completed at 12 o'clock midnight?

A. That is correct.

Q. Forgetting for a minute the pre-cooling and the run-off time, a car would have to be loaded and then brought into the concentration point before 3 A. M., loaded before 12 midnight, and brought into the concentration point before 3 A. M. in order to get into that day's schedule. I am disregarding any additional time of run-off time or because of pre-cooling.

A. No, Mr. Strouss. I think I can explain it this way. The basic schedule from California concentration points is predicated upon a 3 A. M. departure with a 12:30 A. M. arrival the seventh morning at Chicago with a total over-all of 139 hours and 30 minutes, also includes a 16-hour run-off.

[fol. 1980] Q. I understand that but I was trying to disregard that for the time being.

A. That is the basis on which we handle the traffic. There is no traffic originating in California that must be in a concentration point by 3 A. M. to move on that day's schedule.

Q. With the run-off period it would have to be in by 7 P. M.?

A. Following the date of loading, yes, sir.

Q. You said that pre-cooling under the agreement in California, I believe it allows them to 5 A. M.?

A. That is correct.

Q. And that they sometimes add to your run-off time, making it 20 to 21 hours. Why is that when your run-off time extends to 7 P. M.?

A. When we entered the agreement with the shippers in California at a meeting in Fresno, California, permitting them to pre-cool their shipments until 5 A. M. of the morning of the following day of loading, the California lines themselves agreed that if the traffic arrived at a concentra-

tion point by 7 P. M. that we would permit that traffic to be handled out on that day's schedule. Now with our traffic starting to be assembled at 5 A. M. at the most distant point [fol. 1981] from the concentration point it is a very tight schedule in the pickup service to get that all to the concentration points by 7 P. M. and then the traffic must be iced, made up into trains, and very, very often the trains do not depart the concentration point until midnight or after and that delay is all run-off before we get to Chicago.

Q. The delay is not due to an extension of the time, it is due to a congestion in the cars coming in at the end of the run-off period, making it impossible to get them out rapidly?

A. That is correct. I would say there is considerable bunching of trains into our concentration points which makes for delay in the getting of cars in, made up, re-iced, and out.

Q. This morning you were asked about the operation of your trains during a typical period and other times and you testified that they were operated under a books of rules issued by the company?

A. That is correct.

Q. There are really several books, aren't there, there is a book of signals, a book of duties of the crew, and a book on brakes?

A. Yes, but what I referred to, Mr. Strouss, was the [fol. 1982] operating book of rules which governs the transportation employees in the operation of the train. We do have, as you say, other books of instruction and rules regarding air brakes and signals.

Q. They govern the transportation employees in the operation of the trains do they not?

A. As well.

Q. And the rules that are contained in your trainmen's timetables, special instructions?

A. Special instructions and rules contained in the working timetables.

Q. During the operation of this typical period were those rules in effect?

A. Covered by my exhibit?

Q. Yes.

A. Yes.

Q. Were there any unusual rules, any peculiar rules that were used during that period that were not used in the ordinary operation of your trains?

A. No, sir.

Q. Are you familiar with these different rules?

A. Well, I might say that I am a little hazy on the book of rules, I haven't been in contact with it since I was train master.

Q. Your air brake instructions are in what is known as [fol. 1983] the "Green Book"?

A. That is correct.

Q. Is this a copy of it (handing book to witness)?

A. Yes, that is a copy of it.

Q. Will you read into the record the part between the pencil marks there, please?

Mr. Mason: Let me see it, please. I object to the question as not proper cross examination, the witness hasn't testified to anything in connection with the air brake book. I asked him only as to the transportation book of rules.

Mr. Strouss: They have a showing as I understand it of similar operations to the Southern Pacific and we have a right to show what the nature of the operations are.

Mr. Mason: Make the witness your own witness when your own case is on, Mr. Strouss. It is not proper cross-examination.

Mr. Strouss: He has testified as to operations here, typical operations and we have a right to go into what those operations are. He says they are governed by rules and these are some of the rules.

The Court: My recollection is, Mr. Mason, that you asked this witness with reference to certain operating instruc- [fol. 1984] tion books which were given to their employees for their guidance under which they operate. You are speaking, Mr. Strouss——

Mr. Strouss (Interrupting): To put in evidence what those regulations are.

Mr. Mason: I asked him about the transportation book of rules, which as Mr. Strouss in his examination disclosed is quite distinct from the air brakes book.

Mr. Strouss: The question was whether they didn't operate under rules of operation.

Mr. Mason: It was in this morning's record.

Mr. Strouss: The question this morning didn't designate any book.

The Court: I will overrule the objection. You may answer. Will you make it clear what book you are reading from and the page.

Mr. Mason: May we have him specify the date of publication?

The Court: Yes.

The Witness: I am reading from form 2501, Standard Santa Fe Instructions for Operating and Maintaining Air Brake Apparatus.

Mr. Mason: I think the date of publication is shown on the title page.

The Witness: Revised 1926 by the A. T. & S. F. Ry. On page 12 under item "Brakes sticking."

[fol. 1985] Mr. Mason: Just a minute, would it be all right to copy it in?

Mr. Strouss: Yes, but I want the court to hear it, I would rather have it read.

The Court: Go ahead and read it.

A. (Reading:) "As a general rule the cause for brakes sticking is due to the failure to raise the brake pipe pressure quickly above the auxiliary reservoir pressure which must be done in order to move the triple valve parts to release position. It is more difficult to release the brakes on a long than on a short train and there is a difference between triple valves that stick and fail to release and those that release with the others and reapply, or those that creep on when the brakes are not being used. The first mentioned may be due to failure to raise the brake pipe pressure promptly or an individual triple valve having a bad packing ring. The second mentioned (which is most likely to occur on the head end) can be due to a slight overcharge while the third mentioned (the creeper) can only be caused by an erratic working feed valve, a closed angle cock or the engineman moving the brake valves to release and back to running position after train is charged and with a little study of the operation of the equipment [fol. 1986] if the experience of everyday practice is made use of much of the trouble can be anticipated and prevented."

Mr. Booth: We ask that the whole book be in evidence and we will undertake to furnish a copy of it and identify the copy to counsel.

Mr. Strouss: That is agreeable to me.

Mr. Booth: We will offer the whole book.

The Court: It may be admitted in evidence if there is no objection.

Mr. Strouss: You will provide me with a copy of the book?

The Witness: I will undertake that. How many copies?

Mr. Booth: Three copies.

Mr. Strouss: I would prefer to have one of these copies that are being brought in put in evidence. This is borrowed.

Mr. Booth: Yes, I understood that.

Mr. Strouss: This is one of the employee's books for which he is answerable.

Mr. Booth: That is why I suggested getting the copies.

The Court: You will furnish those, Mr. Mahoney?

A. I will mail those to Judge Booth.

[fol. 1987] (The document referred to was received in evidence and marked "Defendant's Exhibit No. 152.")

Mr. Strouss: I am not offering this in evidence, I just want to first offer the parts I am interested in. They may offer the whole book when it comes their turn on rebuttal.

Mr. Booth: I think it is a general rule of evidence when a publication is shown to a witness and he is asked to read an excerpt from it where, as it is claimed here, there are other rules that explain and may be construed as modifying these rules, that we are entitled to have the whole publication go into evidence.

Mr. Strouss: They are, if they want to offer the rest of it.

Mr. Booth: We do want to offer the rest of it.

Mr. Mason: I understand the record now shows it has been offered and no objection made and received and is now exhibit No. 152.

Mr. Strouss: It is not their turn to fish in the pond, I am doing it now.

(Discussion off the record.)

[fol. 1988] The Court: You may proceed.

Mr. Strouss: May these be marked for identification as one exhibit?

The Court: They may be marked.

The Clerk: Plaintiff's Exhibit No. 153, for identification.

Mr. Mason: May we have identified in the record what 153 consists of?

The Court: Yes, you may state, Mr. Strouss.

Mr. Strouss: I will. I think I will let Mr. Mahoney state. He can probably state better than I can. Will you state what these are, Mr. Mahoney?

A. These are the employees' working timetables for the New Mexico Division of the Western Lines, Northern District, Albuquerque Division, Arizona Division, Los Angeles Division of the Coast Lines.

Mr. Mason: What are the effective dates of the several timetables?

A. All effective October 27, 1940, 12:01 A. M.

Mr. Strouss: And they are the timetables now in effect?

A. In effect at the present time.

Mr. Strouss: We offer those in evidence.

Mr. Mason: No objection.

[fol. 1989] The Court: They may be admitted.

The Witness: Do you need additional copies to those?

Mr. Strouss: You better have several additional copies of those.

The Court: This probably is the plaintiff's first exhibit.

Mr. Strouss: Yes.

The Court: Mr. Clerk, you may mark this particular exhibit "Plaintiff's Exhibit 153, in evidence."

Mr. Strouss: It is for identification first, and then in evidence. No further questions.

Redirect examination.

By Mr. Mason:

Q. Mr. Mahoney, you were asked to read in from the Coast Lines timetable issued for the information of the public, the consists of certain trains which are shown or referred to on Exhibit No. 139. Now, I will ask you if the timetable from which you read isn't the one effective on and after December 22, 1940?

A. Yes.

Q. And that is subsequent to both of the periods referred to on Exhibit 139?

[fol. 1990] A. Yes. I might say that this is our winter season folder, and we issue folders as summer folders and winter folders.

Q. Now, I will ask you this, also, whether the consists, as advertised to the public in the folders, do or do not indicate the minimum number of passenger-carrying cars of various classes which those trains will normally carry?

A. Yes, that is the minimum schedule, or the normal consist.

Q. And in addition to whatever passenger-carrying or passenger accommodating cars may be shown in the schedules, or the consists, rather, as advertised to the public, there may be head end cars such as baggage and mail cars, I think you mentioned.

A. Yes, there is. We use a buffer in all of our trains.

Q. Is there sometimes more than one such car?

A. Yes, generally there is a mail and storage mail, or mail and a baggage.

Q. Now, in reference to the movement of pre-cooled traffic, do you have traffic originating in California in the neighborhood of points such as Modesto and Lodi?

A. Yes.

[fol. 1991] Q. That concentrates at Bakersfield, does it?

A. Yes.

Q. Does any pre-cooled traffic originate in that neighborhood?

A. Yes, there is.

Q. If I understand your explanation correctly, it is that this pre-cooled traffic may be held at the point of pre-cooling until five A. M. following the day of loading; is that correct?

A. That is correct.

Q. And if it is pre-cooled, for example, at Lodi, it may then move after five A. M. to Bakersfield?

A. That is correct.

Q. And will still be given the schedule from Bakersfield timed theoretically to start at three A. M. of that same day?

A. That is correct.

Q. Now, about how far is Lodi from Bakersfield for traffic moving over the Santa Fe from Stockton?

A. I would say approximately three hundred miles.

Q. Mr. Mahoney, is any of the extension, or increase of the run-off time, by reason of the latitude allowed to [fol. 1992] these pre-cooled shipments due to the fact that

the shipments need not be released until five A. M. of the day following the date of loading?

Q. I don't think I understood.

Q. You said that the run-off time in case of pre-cooled shipments, or because of the pre-cooled shipments, sometimes was increased from sixteen to twenty or twenty-one hours?

A. That is correct.

Q. I will ask you if any of that increase is due to the latitude allowed to shippers of pre-cooled traffic in being permitted to hold their shipments until five A. M. of the day following the date of loading?

A. Yes, and I might add further that all of the delay beyond the 16-hour run-off is absorbed by the California Lines themselves in running off the delay.

Mr. Mason: That is all, Mr. Mahoney.

Recross-examination.

By Mr. Strouss:

Q. Could you furnish the consists of your trains during the summer months, for the past summer months, of these trains?

A. Yes, I can, both ways, if you desire.

[fol. 1993] Q. Will you do that?

A. Yes, I will be glad to.

Mr Mason: We can introduce that as an exhibit with the appropriate number at the time.

The Witness: Of these same trains that are shown in this exhibit?

Mr. Strouss: Yes.

The Witness: I will do that.

The Court: Is there any further examination of this witness?

Mr. Strouss: No further examination.

The Court: Then, may Mr. Mahoney with his records be excused?

Mr. Strouss: Yes.

The Court: It is so ordered.

(Witness excused.)

Mr. Mason: Mr. Dyer, will you take the stand, please?

JOSEPH HENRY DYER was called as a witness on behalf of the defendant and, being first duly sworn, testified as follows:

Direct examination.

By Mr. Mason:

Q. Mr. Dyer, will you state your name to the reporter, [fol. 1994] please?

A. Joseph Henry Dyer.

Q. Where do you reside, Mr. Dyer?

A. San Francisco.

Q. What is your present position with the Southern Pacific Company?

A. Vice-President, in charge of maintenance and operations.

Q. When did you first join forces with the Southern Pacific, Mr. Dyer?

A. In March, 1888.

Q. Have you served the Southern Pacific continuously since that time?

A. Continuously since 1888.

Q. Will you just state the positions you have occupied, not necessarily the times, but the positions themselves, to show your experience in service.

A. I was track laborer and a track foreman from March, 1888, to the fall of 1889; I was freight brakeman from 1889 to 1895; freight conductor from 1895 to 1902; general yardmaster, Sacramento, Roseville and other points on the Sacramento division, from 1902 to 1904; from 1904 to 1908 I was trainmaster on the Sacramento division; 1908 to [fol. 1995] 1911 I was superintendent of the Shasta division extending from Red Bluff, California to Ashland, Oregon; from 1911 to 1914 I was superintendent of the Tucson division, located here in Tucson, Arizona. The division at that time extended from Yuma, Arizona, to El Paso, Texas. From 1914 to 1916 I was superintendent on the Sacramento division, which division extends over the Sierra Nevada Mountains, from Sacramento to Sparks, Nevada, and Sacramento to Dunsmuir, California; from 1916 to 1918, I was assistant manager of what is known as the Northern District. Those lines extended from San Francisco, California, to Ogden, Utah, and Portland, Oregon.

From 1918 to 1929 I was general manager of the entire system, Pacific System, extending from El Paso, Texas, to Portland, Oregon, and Ogden, Utah. 1929 to date, I have been vice-president in charge of operations.

Q. Now, as vice-president in charge of operations, what is the scope of your duties, and your responsibility, Mr. Dyer?

A. Responsible for all operations and maintenance.

Q. And do the general officers, respectively charged in [fol. 1996] dividually with the maintenance, engineering and operations report to you as the head of the department?

A. They do. The chief engineer for maintenance of the property, and the general superintendent of motive power for the maintenance of equipment, and the general manager for the transportation.

Q. You have testified, Mr. Dyer, that you were superintendent of the Tucson division at Tucson in 1911 and until 1914?

A. That is correct.

Q. Did the Tucson division at that time include all of the Southern Pacific lines in the State of Arizona?

A. As they exist now?

Q. No, as they existed at that time?

A. Yes, all the lines between Yuma, Arizona, and El Paso, Texas, including the Nogales branch.

Q. There was no Rio Grande division at that time as at present, including part of the line in Arizona?

A. No.

Q. And your jurisdiction then covered all of the Southern Pacific lines in Arizona?

A. That is correct.

Q. Now, without undertaking to go into detail precisely, [fol. 1997] will you say from your experience of that time what was the general weight of the rail in the main line as of that day?

Mr. Strouss: Objected to as immaterial.

The Court. Objection overruled.

A. The weight of the rails was 75, 80 and some 90-pound rail, but very little.

Mr. Mason: That is on your division in 1912?

A. That was on the Tucson division in 1912.

Q. Now, in 1912, Mr. Dyer, and referring yourself to the map which is on the easel and which has previously

been introduced and received in evidence as Exhibit No. 1, will you state whether the line from Wellton via Phoenix to Picacho, existed at that time as part of the Tucson division?

A. It did not.

Q. Did the line from Tucson, formerly a part of the El Paso and Southwestern, to Mescal and thence via Douglas to El Paso, exist in 1912 as a part of the Tucson division?

A. Not as part of the Tucson division; that was owned by the El Paso and Southwestern. In 1912 they started the construction of the line from Douglas to Tucson.

Q. Now, did the branch which now extends from Tucson [fol. 1998] direct to Nogales, did that exist, or was that under construction at that time?

A. That was under construction in 1912.

Q. Now, returning again to the situation on your division in 1912, generally speaking, what was the prevalent length of the sidings, the passing sidings?

A. Well, they varied, they would hold from about 45 to 65 or 70 cars, they varied in length.

Q. What types of freight and passenger locomotives did you use in the Tucson division in 1912; and I will ask you in this connection to refer to the diagrams which are in evidence as Defendant's exhibit Numbers 5 and 6, No. 6 is the passenger power, and No. 5 the freight power of the Southern Pacific.

A. The freight power was a consolidation engine.

Q. Did you use the Mogul type?

A. Some Moguls were used in freight service, the consolidation engine was the largest engine we had on the division.

Q. In passenger service, did you use the ten and twelve-wheeler, or the Mogul?

A. We used what was known as the Atlantic type between Yuma and Tucson, and the Mogul type engine between [fol. 1999] Tucson and Lordsburg, and the Atlantic type between Lordsburg and El Paso.

Q. Do you recall the wheel arrangement of the Atlantic type? I see it is not shown on either of those exhibits.

A. Yes, it was two large drivers and the engine truck.

Q. On each side?

A. Yes.

Q. Does that correspond to the 4-4-2 under the Whyte arrangement?

A. Yes.

Q. I will ask you to refer to the Southern Pacific Company's classification and assignment of locomotives——

(Addressing Mr. Strouss:) Are you familiar with the book, Mr. Strouss, as showing some of the Atlantic type locomotives now in service?

Q. (Continuing) My question, Mr. Dyer, had to do with the Atlantic type shown on page 42. I will ask you by referring to the locomotive book, what the tractive effort of a typical A-3 Atlantic type locomotive type is, as shown by that book?

A. They varied from about 23,000 tractive power to 27,000.

[fol. 2000] The Court: Was that passenger or freight?

A. Passenger, known as the Atlantic type locomotive.

Mr. Mason: Were those A-3 locomotives the type that you had in passenger service on the Tucson division in 1912?

A. Yes, between Yuma and Tucson, and Lordsburg and El Paso.

Q. Now in 1912, Mr. Dyer, were the freight cars all steel or steel underframe cars, or were you still operating some proportion of all wood cars?

A. I would say probably forty per cent of the equipment in 1912 was of wood construction.

Q. What about the passenger cars as of that date?

A. They were wood construction with steel underframe.

Q. Did you operate standard Pullmans at that time?

A. Yes.

Q. Were they steel or wooden cars?

A. Wooden superstructure and steel underframe.

Q. Generally speaking, what was about the average length of the main line freight trains that you operated on the Tucson division in 1912?

[fol. 2001] Mr. Strouss: Object to that as immaterial.

The Court: Objection overruled.

A. In cars?

Mr. Mason: In cars.

A. The average length was about 45 to 47 cars.

Q. And what was the average length of the passenger trains operated in main line service as of that time?

A. About nine to ten cars.

Q. You recall, of course, the enactment of the Arizona Train-Limit Law in 1912, do you, Mr. Dy[illegible]?

A. Yes, sir, very well.

Q. Will you say whether or not the limitations of the law, the 70 and 14 car limitations, respectively, had any effect, or substantial effect, upon your operations in 1912 on the Tucson division?

Mr. Strouss: I object to that as immaterial and as calling for the conclusion of the witness, on a matter that is capable of proof.

The Court: I think it is material, but is is calling for a conclusion.

Mr. Mason: Well, Your Honor, I think that the witness is eminently qualified to say whether a statutory limita- [fol. 2002] tion of seventy cars had any substantial effect upon the length of the trains which he was then operating as superintendent of the division, and which division included all of the Southern Pacific Lines in Arizona.

Mr. Strouss: I think the Court is eminently qualified to arrive at whatever conclusion is necessary from the facts as they are shown.

The Court: No, I will overrule the objection. He may answer.

Mr. Mason: I will rephrase the question if that will perhaps meet the objection.

Q. Did the enactment of the Arizona law, and particularly of the 70-car limitation, cause or compel you to reduce any substantial number of the freight trains you were then operating?

A. It had very little or no effect on our operations when the law was passed.

Mr. Strouss: That doesn't answer the question. I move that the answer be stricken.

The Court: That is true. It may be stricken.

Mr. Mason: Well, then, I will ask that my previous question be read, the one prior to the question just answered.

(Thereupon, the following question was read by the reporter: "Will you say whether or not the limitations of

[fol. 2003] the law, the 70 and 14 car limitations, respectively, had any effect, or substantial effect, upon your operations in 1912 on the Tucson division?")

Mr. Mason: I would like to re-submit that question and ask it of you again, Mr. Dyer. Mr. Strouss: We renew our objection.

The Court: Objection overruled. You may answer.

A. It did not. I might qualify that by stating that if it did, it was in a very small measure. Occasionally we would operate a train of probably 71 or 72, as high as 74 empty cars westbound, but that was very, very seldom.

[fol. 2004] Mr. Mason: Mr. Dyer, from your standpoint as general manager or as vice-president in charge of operations, about what year did you begin to experience any effect of the Arizona law upon Southern Pacific operations in Arizona?

Mr. Strouss: That is objected to as calling for a conclusion of the witness.

The Court: Objection overruled, you may answer.

A. In 1925 we began to feel the effect of this train limit in Arizona.

Mr. Mason: What was the circumstance that led to that?

A. Due to the purchase of a large number of heavy locomotives in the years of 1918, 1919, and 1920 and up to and including 1925.

Q. Were those locomotives of larger hauling capacity than you had previously operated?

A. Very much larger, and due to the volume of business being handled, seasonal operations; it was necessary in order to get the use of that power to transfer it from one district to another. I might explain, if I am permitted, that in the spring of the year, due to the cantaloupe and lettuce movements, the business is heavier through Arizona to the East and in the same period there is light business on the [fol. 2005] Ogden route and as the result of that our business is transferred from the Ogden route to the southern route and when this rush is over, in the fall, during the heavy deciduous fruit movements the engines are transferred to the northern divisions.

Q. When you speak of these heavy locomotives, what particular types of power acquired in the years 1918 to 1920 do you have in mind?

A. What are known as 2-10-2's.

Q. Did you acquire any 4-8-2 locomotives in that period?

A. Mikados?

Q. No, the Mountain type.

A. Yes, that is a passenger engine.

Q. Is it used at times on freight?

A. Yes, used at times on freight. Three classes of the 2-10-2, 3,600 up to 3,785 all heavy 2-10-2's. In 1925 we purchased 50 what are known as a three-cylinder engine, five thousand series, which is still a heavier engine, and in 1928 we made purchase of what is known as the Mallet Consolidation, still a larger engine, heavier locomotive.

Q. Mr. Dyer, as assistant general manager in 1916 did your jurisdiction extend to and include the lines in Nevada [fol. 2006] and Utah?

A. It did.

Q. Your jurisdiction as general manager and vice-president included those lines?

A. Yes.

Q. Is there any difference between the code of operating rules of the Southern Pacific applicable in Arizona and in Nevada and Utah, respectively?

A. No, the same rules apply.

Q. Is there any difference in the standards of maintenance of the properties in the two states?

A. No difference whatever.

Q. Is there any difference in the character of the rolling equipment used in the two states?

A. No; the rolling equipment is used all over the system.

Q. Do you use the same engines sometimes in Nevada and at other times in Arizona or on the southern route?

A. That is correct.

Q. Do you transfer officials of the company, operating officials of the company such as train masters, superintendents, and assistant superintendents, or promote them from the Nevada division to the Arizona division and vice versa.

A. All over the system we rotate those men, both our [fol. 2007] superintendents and train masters are promoted. For instance, a man may be assistant superintendent or train master today on the Salt Lake division and may be

transferred here and the next promotion to assistant superintendent in the Tucson division or vice versa. We aim to give our men in making promotions experience on all the properties under my jurisdiction.

Q. In your own experience, you came from the Shasta division to the Tucson division?

A. As superintendent.

Q. And returned to the Salt Lake division?

A. Yes.

Q. Have there been instances of men who were division officers on the Tucson division being made division officers on the Salt Lake division?

A. No, but there are assistant superintendents who were on the Tucson division who were made superintendents of the Salt Lake division.

Q. Is there a transfer of the engineering personnel of the division?

A. It follows the same course, division engineers and master mechanics, not so much in the mechanical department as it is in the roadway department.

Q. Are you familiar in a general way with the character [fol. 2008] of the traffic handled on the main lines across Nevada and Arizona?

A. Yes, sir, in a general way.

Q. Is there any substantial movement of perishable traffic over either or both of these lines?

A. Very substantial movement of perishable traffic on both lines.

Q. Is that traffic handled on the refrigerator cars?

A. Yes, sir.

Q. What direction does that traffic move in a predominant volume?

A. Eastbound, and the empties are returned light or empty westbound.

Q. Is the empty movement of refrigerators of the same character on both lines?

A. Yes.

Q. Is the return of the empty refrigerator cars a matter of any importance during the producing or heavy shipping seasons?

A. Just as important as moving a carload of perishable freight. We have to get those refrigerators back to the originating point for the load.

Q. What is the predominant character of the westbound movement over these two lines and does it differ substan-
[fol. 2009] tially in Arizona as compared to Nevada?

A. The westbound movement is about the same on both lines. It is what they call "manifest" freight movement to the coast, mostly Los Angeles, moves by the southern gateway to southern California and to northern California it moves by the Ogden gateway.

Q. From the operating standpoint, are you familiar with the operating obstacles and problems to be overcome on both routes?

A. I don't quite get your question, Mr. Mason.

Q. The grades and curvatures?

A. Oh, yes.

Q. And such problems as may be afforded by weather and similar conditions?

A. Yes.

Q. Is there any substantial climatic difference which has an effect upon railroad operations as between Arizona and Nevada?

A. Very much so.

Q. What is that difference?

A. The heavy snows over the Pequop Mountains in Nevada in extreme cold weather in the winter months ranging as low as twenty and thirty and I have seen it as low as forty-five degrees below zero at Wells, Nevada.

[fol. 2010] Q. Is any such weather as that encountered in Arizona?

A. No.

Q. Apart from the severe winter weather is there any substantial climatic difference which would affect railroad operations as between the two states?

A. No, outside of the climatic conditions.

Q. Outside of the cold weather?

A. Outside of the cold weather they compare very favorably towards each other.

Q. What as to the grades and curvatures?

Mr. Strouss: I object to that as calling for a conclusion and a matter which is a matter of record of the company.

Mr. Booth: This is merely preliminary, Your Honor, we will produce those in great detail.

Mr. Strouss: Even if it is preliminary, a conclusion is not permissible.

The Court: I will sustain the objection to this question.

Mr. Mason: From your standpoint as an operating man of long experience, is there any difference between the possibilities of long train operation in Nevada and in Arizona except as to the restriction contained in the Arizona Train Limit Law?

Mr. Strouss: I object to that as calling for a conclusion. [fol. 2011] The proof of what the conditions are will be determined from facts. Certainly the court is not going to have the witness decide whether the trains can be run as easily in one place as in another. There are conditions and facts which should be shown that haven't been shown yet.

Mr. Mason: Do I understand that the objection is on the ground it calls for a an opinion of the witness?

Mr. Strouss: It calls for a conclusion as to matters which are capable of proof by fact.

Mr. Mason: The witness is very well qualified to state the answer to the question from his standpoint as an operating man of long experience. I don't know where we could find a more highly qualified man, a man who can view this matter from the standpoint of the Southern Pacific and as one who has undertaken and solved those very problems which I am asking him.

Mr. Strouss: That is not the only criterion as to whether opinion evidence is admissible. A man may be one of the outstanding men in his profession or calling and yet if the situation is one which is capable of proof by facts there is no necessity for opinion evidence. There isn't any showing [fol. 2012] here that this is something which cannot be shown by the facts themselves. As a matter of fact is is quite apparent that the facts with respect to the conditions of operations can be shown.

Mr. Mason: I think the objection is addressing itself to a previous question or to a question that Mr. Strouss hopes and fears that I will ask and not to the question which I did ask. I would like to have the question I did ask read to the court so he may understand what I am asking for.

The Court: Read the question.

(The last question was read by the reporter.)

(Discussion off the record.)

[fol. 2013] Mr. Strouss: The matter of whether the testimony is admissible or not is not dependent solely on whether the witness is qualified. There is the question of the necessity of opinion evidence. There hasn't been any showing that there is any necessity for opinion evidence. They are jumping clear over the stream by asking a question without showing any facts or without any opportunity to go into the facts. They are asking whether there are any conditions other than the Train Limit Law which would affect the operation of trains in Arizona the same as in Nevada.

Mr. Mason: That is not the question I asked.

The Court: Read the question again.

(The question was read by the Reporter as follows: "From your standpoint as an operating man of long experience is there any difference between the possibilities of long train operation in Nevada and in Arizona except as to the restriction contained in the Arizona Train Limit Law").

Mr. Strouss: That is just one way of saying "are the operating conditions any different in one state than in the other". This is a matter which is capable of proof and then from the facts which are proved that opinion which is here [fol. 2014] asked is to be determined. Without the Court even having heard what the evidence may be, without anything to indicate it, we don't think that is proper, certainly without a further showing that the problem is one which a layman couldn't determine for himself. The rule is laid down in Corpus Juris at 22 Corpus Juris, 498, (reading) "The danger involved in receiving the opinion of a witness is that the jury may substitute such opinion for their own, and the courts will not require parties to encounter this danger unless some necessity therefor appears. Accordingly, where all the relevant facts can be introduced in evidence, and the jury are competent to draw a reasonable inference therefrom, opinion evidence will not be received". It is no different in a case which is tried to the court than to a jury.

The Court: Your point is there is no evidence yet as to operating conditions in Nevada, that they are jumping over the operating conditions and asking for a comparison between the operations in the two states without having shown as preliminary the conditions in Nevada.

Mr. Strouss: Showing the similarity of conditions and drawing a conclusion as to any facts without stating what

[fol. 2015] the conditions are. (Reading) "When the facts are such as can be detailed and described and the jury is able to understand them and draw a conclusion without opinion evidence, the *the* necessity for opinion evidence does not exist." That is 35 Pacific 663. That is the rule universally followed by the courts and it is on that rule that I am making my objection.

Mr. Mason: Your Honor, this is not a jury case and the rule certainly has a greater latitude in a case which is tried to the Court. The rule as stated by your Honor is the rule which is applicable here, and again, this does not ask primarily for the opinion of the witness upon what your Honor stated was one of the vital elements in the case but rather it asks him if there is any difference from his standpoint as an operating man. When the question is clearly understood it seems to me that all of this reference to opinions before juries falls entirely wide of the point and what your Honor has stated in the rule from Jones is the applicable rule here.

Mr. Strouss: There hasn't been anything here to show that the Court cannot arrive at these facts if they are shown to the Court. This is just an attempt to avoid showing the [fol. 2016] facts.

Mr. Mason: I don't think there is going to be any attempt at avoidance of showing the facts. Your Honor, we expect you will be an expert on railroad operations before this case is closed, but at this stage of the case I think nine of us have arrived at that point except perhaps Mr. Dyer.

The Court: Well, in this instance you are asking for a comparison where in one instance you have no factual basis on which to predicate it. There has been considerable testimony from other witnesses as to conditions in the State of Arizona of the ruling grade and general operating conditions and up to date you might say there hasn't been a word of testimony as to conditions in the State of Nevada, yet you are in effect seeking by this question to draw a comparison between the two operations. I have no question in my mind but what this witness is qualified to give such an opinion but whether he is entitled under the rules of evidence to give that opinion without the factual situation being developed is a question in the Court's mind and on second thought I am going to sustain the objection.

Mr. Mason:

Q. Mr. Dyer, do you operate trains in excess of 70 cars in Nevada?

[fol. 2017] Mr. Strouss: Objection to that as immaterial.

The Court: Objection overruled; he may answer.

A. We operate trains in excess of 70 cars, not only in Nevada, but California as well and Oregon.

Mr. Strouss: I move to strike the last part.

The Court: I didn't catch the last part of the answer. You were asked as to a certain state and you volunteered as to other states. The last part may be stricken.

The Witness: I will try to confine myself to the question.

Mr. Mason: Have you followed the practice of operating trains in excess of 70 cars in Nevada for several years?

A. A great, great many years.

Q. If you were relieved of the restriction of the Arizona law in one way or another would you undertake the operation of trains in excess of 70 cars or 14 cars as the case may be in Arizona?

Mr. Strouss: That is objected to as irrelevant and immaterial and calling for a conclusion.

Mr. Booth: I would like to be heard on that a moment.

The Court: Read the question please, Mr. Reporter.

(Question read by the Reporter).

[fol. 2018] Mr. Booth: The answer in this case contains a number of averments of our belief that the law is unconstitutional. We say that it impairs the free use of our facilities; we say that it is a burden on interstate commerce; we say it is an interference with interstate commerce and rely on the due process clause as taking our property without compensation. Now it matters not if all those allegations be true if the party making those charges is neither in a position nor has the desire to operate his property free from the restrictions of the law or to utilize his property in the manner forbidden by the law. In other words, if the defendant in this case were to come into court at the conclusion of the case and state to your Honor, even if this law should be repealed or if Congress should enact a national train limit law which would have the effect of superseding it, or if this law should be declared to be unconstitutional by the

final decree of a court of competent jurisdiction, we nevertheless would not operate trains in excess of 70 cars in Arizona, why the case would fail at once.

The Court: To shorten this up I think we better hear from Mr. Strouss on this.

Mr. Strouss: My position is simply this, what the answer [fol. 2019] alleges, as I have argued before, doesn't make the evidence admissible, but aside from that, if this law is in violation of the commerce clause that is a matter of proof by evidence and whether or not it is constitutional cannot depend in any way on what their operations would be if the law were not in effect. That is immaterial so far as the case before this Court is concerned. There is another phase of this of course. Mr. Dyer doesn't know what conditions will be, but regardless of the question of the law itself I think he will admit that the availability of traffic for one thing would affect the movement of trains and the train lengths, and whether they are going to operate trains if this law is in effect or not in effect depends to some extent upon the traffic and other factors.

The Court: The Court doesn't care to hear from you further, Mr. Booth. I will overrule the objection, he may answer. Read the question to the witness.

(Last question of Mr. Mason read by the Reporter).

A. We would, and at once.

[fol. 2020] The Court: In order that the Court's position may be clear, may I say, Mr. Strouss, that I quite agree with you that his answer to that question does not in any way affect the constitutionality of the law, but it does show what the defendant's attitude and intentions would be if they were successful in this litigation, and it is for that reason that I am admitting it.

Mr. Mason: Your Honor, if we have no intention of operating trains in excess of the limits of the law and would not do so, of course, we could hardly complain that the law is a burden on interstate commerce. It seems extraordinary that the State should come in here and prosecute us for a violation, an asserted violation of the law, and endeavor to maintain the law in effect, and yet not be interested at all in determining whether we intend to operate such trains in the future.

The Court: You may proceed.

Mr. Mason: To what extent would you undertake the operation of freight trains longer than seventy cars?

Mr. Strouss: Objected to as a conclusion as to what extent.

[fol. 2021] The Court: Yes, there are so many factors entering into that, Mr. Mason. Sustain the objection to the question as framed.

Mr. Mason: Would there be any reason because of present siding capacities which would limit the extent of the operation of freight trains of longer than seventy cars, Mr. Dyer?

A. There would not. That is, I say there would not; that would be in one direction.

Q. Would you undertake the operation of long trains; by that I mean trains longer than seventy cars in one or the other directions, but not in both?

A. Absolutely.

Mr. Strouss: May I have the record show my objection goes to this without repeating it?

The Court: Yes, the record may so show, and the objection is overruled.

Mr. Mason: Would you operate passenger trains of more than 14 passenger cars, as traffic might indicate?

A. We certainly would.

Q. Would you make any change in power assignments to the lines in Arizona?

A. We would; as we purchase heavier power it would naturally be transferred to the Arizona district.

[fol. 2022] Q. Would you undertake any program of siding or passing track extension?

A. We would in order that longer trains could be handled both directions.

Q. Would there be any changes in shops or roundhouse facilities in this territory?

A. Very little change, with the exception of the 126-foot turntable in Tucson and one in Yuma, and probably some slight alterations in our roundhouses to take care of the heavier power.

Q. You would make whatever changes were necessary to take care of the heavier power?

A. Absolutely.

Q. Mr. Dyer, are there in effect, to your knowledge, on the Southern Pacific any restrictions on the tonnage which

may be handled in trains by reason of contracts with the train-service brotherhoods?

A. There are no restrictions with the exception of Arizona as to the number of cars we handle in a train. There are no restrictions if the second engine is used in helper districts. I want to make this clear: We have what is known as helper districts, we can put one, two, three or half a dozen engines in a train, and help it up those heavy grades such as we have in the Sierra Nevada Mountains, the Cascade Moun- [fol. 2023] tains, and so forth. There is no penalty.

Mr. Strouss: Are you speaking of Arizona now?

A. Arizona is included. We have helper districts in Arizona.

Mr. Strouss: I understood the question to be "agreements as affecting Arizona."

Mr. Mason: I said the System.

Mr. Strouss: I didn't so understand it.

The Witness: I understood him to say on the System.

Mr. Mason: I did say System.

The Witness: Will you read my answer?

(The answer so far given by the witness was read by the reporter.)

The Court: Now, go ahead, Mr. Dyer, and finish your answer.

A. There is no penalty. However, if a second engine is used in a district where a helper engine is not permitted to be used on account of the number of cars in the train, then it would be necessary to pay double miles to the train crew. In other words, if the rating——

Mr. Strouss: Pardon me a minute. Is this a matter of agreement?

Mr. Mason: I referred to contractual agreements with the [fol. 2024] train service brotherhoods.

Mr. Strouss: I think we should have the agreements produced.

Mr. Mason: I have the agreements here.

The Witness (Continuing) In other words, if the rating of the heaviest engine operating in a non-helper district is exceeded and you use a second engine you must pay the crew double miles.

Mr. Mason: The brakeman and the conductor.

A. The brakeman and the conductor, but not the engineer or fireman. That is the reason the railroad as a whole is looking forward to the purchase of heavier power.

Q. Mr. Dyer, is there any main line territory on the System other than in Arizona where a restriction of freight train length to seventy cars is observed? I refer only to main lines.

A. There is none.

Q. Is there any statute in any of the states in which the Pacific Lines operate other than the State of Arizona, which limits the number of cars in a freight or passenger train, that is, that is now in effect?

A. None whatever.

Mr. Mason: That is all.

[fol. 2025] The Court: The court will be at recess until ten o'clock tomorrow morning.

(Thereupon, the court stood at recess until Thursday, January 9, 1941, at ten o'clock A. M.)

[fol. 2026] January 9, 1941, Ten o'clock A. M.

Proceedings were resumed at this time as follows:

The Court: You may proceed. Are you ready with the cross-examination of Mr. Dyer, Mr. Strouss?

Mr. Strouss: Have you finished?

Mr. Mason: I have a question or two I should like to ask.

JOSEPH HENRY DYER, was recalled to the stand, and testified further as follows:

Direct examination (Continued).

By Mr. Mason:

Q. Mr. Dyer, yesterday you stated that the company operates trains in excess of seventy cars in Nevada. I will ask you whether it operates freight trains in excess of seventy cars in other states in which the Pacific Lines are located other than the state of Arizona?

A. Yes, we operate trains in excess of seventy cars and up as high as 100 and 125 cars in New Mexico, California and Oregon.

Q. And Utah?

[fol. 2027] A. And Utah.

Q. Do such trains operate in that part of Texas where the Pacific Lines run?

A. Yes, but that is a very short mileage through Texas.

Q. Now, I will ask you the same as to operation of passenger trains in excess of fourteen cars; does that take place in Nevada and these other states other than Arizona?

A. That is true.

Mr. Mason: You may cross-examine, Mr. Strouss.

Mr. Strouss: I have no questions.

The Court: This witness then may be excused?

Mr. Strouss: Yes.

(Witness excused.)

W. H. Kirkbride was called as a witness on behalf of the defendant and, being first duly sworn, testified as follows:

Direct examination.

By Mr. Mason:

Q. Will you state your name to the reporter, please, Mr. Kirkbride?

A. W. H. Kirkbride.

Q. Where are your headquarters, Mr. Kirkbride?

[fol. 2028] A. San Francisco, California.

Q. Are you employed by the Southern Pacific Company?

A. I am.

Q. In what position?

A. Chief engineer of the Pacific Lines, also chief engineer of the Northwestern Pacific, the San Diego, Arizona Eastern, of the Southern Pacific, and chairman of the standardization committee of all the lines affecting engineering and maintenance standards.

The Court: Where are your headquarters, Mr. Kirkbride?

A. San Francisco.

Mr. Mason: The Northwestern Pacific and the San Diego Arizona Eastern are affiliated properties of the Southern Pacific, are they, Mr. Kirkbride?

A. They are.

Q. When you speak of the committee, standardizing committee for all Southern Pacific Lines, does that include the Texas and Louisiana Lines?

A. It does.

Q. When you group the Southern Pacific Lines, do you include also the Southern Pacific Railroad Company of Mexico?

[fol. 2029] A. I do.

Q. What has been your academic training and railroad experience, Mr. Kirkbride?

A. I am a civil engineer, graduate of Stanford University. My railroad experience covers a period of about forty-two years in location, construction, maintenance and operation. My time with the Southern Pacific Company dates from 1902, during which period I have occupied the positions of assistant engineer, roadmaster, assistant division engineer, division engineer, assistant superintendent, engineer of maintenance of way and structures, chief engineer, and during World War No. 1 when the United States took over the operation of railroads in the United States I was chief engineer for the United States Railroad Administration of the Pacific Lines of the Southern Pacific Company.

Q. As engineer of maintenance of way and structure, and chief engineer, have you had and do you have system-wide jurisdiction?

A. I do.

Q. And what are the duties and responsibilities of the chief engineer of the System?

A. To look after all construction work and maintenance of the property as the head of certain departments grouped [fol. 2030] under such organizations. For instance, as chief engineer there is consolidated under my jurisdiction not only the location and construction of new lines, but the maintenance of way and structures, and signal departments, electrical department, valuation department. It is our duty at the close of any year to prepare and submit to our executives two budgets, one representing the money that we think should be spent, or that we desire to spend during the coming year in the maintenance of the properties, involving such principal items as bridge and trestle

and culvert construction, laying of new rail, application of ballast, ties, repair and construction of depots and buildings, and the maintenance of the roadbed and track. Following the authoriaztion of the budget, it is our duty to distribute the money to the various divisions of the System, to see that it is economically and properly spent and that authorities are issued from time to time covering the particular items.

Q. Is it correct to say, generally speaking, Mr. Kirkbridge, that the construction, reconstruction, maintenance and repair of the fixed properties, fixed physical properties of the Pacific Lines, comes under your jurisdiction?

[fol. 2031] A. That is correct.

Q. That includes the signals, does it?

A. Yes, sir.

Q. Bridges?

A. Yes, sir.

Q. Rail?

A. Yes, sir.

Q. Ties and roadbed?

A. Yes, sir.

Q. Buildings?

A. Yes, sir.

Q. And other miscellaneous fixed properties of the company?

A. Yes, sir.

Q. Does the engineer of maintenance of way and structures report to you?

A. He is one of my assistants; of course, he also reports to the general manager.

Q. He is one of the principal officers in your department, is he?

A. Yes, sir, he is.

Q. And each of the division engineers is under your jurisdiction?

A. In this way: The System is divided into divisional organizations, each division in charge of a superintendent. One of the officers of the superintendent, responsible to him [fol. 2032] for the maintenance of the property, bridges, buildings, track, etcetera, is the division engineer. We dictate and give instructions pertaining to all that kind of work through the superintendent. The division engineer is

looked upon as our engineering representative on the division.

Q. Now, as the System officer in charge of the engineering, maintenance and so forth, as you have described, have you become familiar with the entire physical plant of the Pacific Lines?

A. I have.

Q. Do you make trips over the lines from time to time?

A. I do; I am out on the road approximately one-half of my time.

Q. What duties do you undertake when you make these trips over the road?

A. To ride on the rear of trains and spend the entire daylight hours, as well as twilight hours, in the inspection of the track and that includes the right-of-way. We frequently stop at stations or terminals and make track motor-car trips in order to view some particular job under way, some bridge or some track condition, or to determine upon [fol. 2033] some method of correcting a runoff that might endanger the roadbed.

Q. How long since you became engineer of maintenace of way and structures, Mr. Kirkbride?

A. I was made engineer of maintenance of way and structures in 1920. That is at the time the government surrendered the railroads to the owners.

Q. And prior to that time you were the chief engineer under the Railroad Administration?

A. I was.

Q. For the same properties?

A. I was.

Q. And when did you become chief engineer?

A. 1932.

Q. Then you have been a System officer since the time of the United States Railroad Administration?

A. I have.

Q. 1918, approximately?

A. Yes, sir.

Q. Have you prepared or had prepared under your jurisdiction a map of a single sheet entitled "Southern Pacific Company, Pacific Lines, Operating Divisions?"

A. I have.

[fol. 2034] Mr. Mason: May this exhibit be marked with the next number in order?

The Clerk: Defendant's Exhibit No. 154 for identification.

Mr. Mason: You maintain, do you, in the engineering department, Mr. Kirkbride, maps of the System as a whole and by divisions?

A. We do.

Q. Was this map prepared from the original records and maps in your department?

A. It was.

Q. And will you say whether or not it is true and correct?

A. It is.

Mr. Mason: Now, I may say, Your Honor, that there has been made available to Mr. Strouss prior to the start of the trial the operating timetables for each of the divisions comprising the Pacific Lines; is that correct, Mr. Strouss?

Mr. Strouss: I have them right here.

Mr. Mason: And they are before him on the table, and each of those operating timetables, sometimes called employees' timetables, contains a map of the division to which it relates, and the accuracy of the exhibit identified as No. 154 can be checked from the timetables in Mr. Strouss' [fol. 2035] possession. Have you any questions, Mr. Strouss?

Mr. Strouss: This map is drawn to scale, is it?

A. Yes, sir, but it is a reproduction, and the scale is shown graphically so that the scale will be reduced in the same manner in which the rest of the map is reduced.

Q. What would that scale be; do you know?

A. Well, it shows approximately forty miles to a half inch.

Q. Did you mean that in photographing this there has been a reduction?

A. Yes.

Q. What would that reduction be on the scale?

A. I can't tell you. This is made from a master tracing.

Mr. Strouss: I think that is all.

Mr. Mason: The scale and the map are photographed?

A. Yes.

Q. So any reduction in the map is a corresponding reduction in the scale?

A. Yes, sir. For instance, if we had marked this "One inch equals 100 feet," it wouldn't give you the proper scale after photographing, but a person with a scale, after pho-
[fol. 2036] tographing, could relate any distance up here marked "Scale in miles" to any portion of the map.

Mr. Mason: Will you say whether the map represents in substantially proper proportion, the lines of the Southern Pacific, and particularly represents correctly the boundaries of the several divisions?

A. It does.

Q. I call your attention to the map, Defendant's Exhibit No. 1, the enlarged copy of which appears on the easel. The map, Exhibit No. 154, is of the same lines but with the division boundaries included, is it not?

A. What was this exhibit?

Q. 154.

A. What was your question?

Q. Whether the map, Exhibit 154, is not a reproduction of the same lines of the Southern Pacific which appear on the easel map, Exhibit No. 1?

A. Yes, sir.

Mr. Mason: We offer the map in evidence as Defendant's Exhibit 154.

Mr. Strouss: No objection.

The Court: It may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 154.")

[fol. 2037] Mr. Mason: Mr. Kirkbride, have you before you a statement in one sheet bearing title, "Southern Pacific Company, Condensed Profiles, El Paso Route"?

A. I have.

Mr. Mason: May we have this exhibit marked "Defendant's Exhibit No. 155" for identification?

The Court: It may be marked.

The Clerk: Defendant's exhibit No. 155 for identification.

Mr. Mason: Do you have in the engineering department profiles of the rail lines of the entire system of the Southern Pacific Company?

A. We do.

Q. Are those maintained there as permanent records?

A. They are.

Q. Referring to defendant's exhibit No. 155 for identification, was that exhibit prepared in the engineering department?

A. It was.

Q. Under your direction?

A. Yes, sir.

Q. From what sources?

A. From the records that are kept in our office dating back to original profiles with changes added and made from [fol. 2038] time to time as additional lines were constructed.

Q. Do your original records show the ruling grades, the elevation in feet, the points at which the grades change, and so forth, as are indicated by the showing on exhibit No. 155 for identification?

A. They do.

Q. Will you say whether or not this exhibit correctly reproduces the information shown on the original records?

A. It does.

Q. I notice there are shown hereon, Los Angeles division, Tucson division, Rio Grande division, and so forth, and also California operation, Arizona operation, New Mexico operation. What is the significance of those particular designations?

A. We have previously referred to an exhibit that showed the various divisions of the Pacific system and these refer to the same subdivisions.

Q. Will you refer to exhibit No. 1, the map on the easel and point out which lines on that easel map are represented on exhibit No. 155 for identification?

A. The line extending from Los Angeles to El Paso and [fol. 2039] extending up from El Paso to Tucumcari and the line from Wellton, which is about 37 mile from Yuma, to Phoenix and around to the old line at Pic ..cho and also extending from Tucson to El Paso via Douglas, as shown on exhibit No. 155.

Q. Does the showing on exhibit No. 155 for identification include any of the branch lines in the territory between Los Angeles and Tucumcari?

A. It does not.

Q. Does it include the alternate line in the Imperial Valley from Niland via El Centro?

A. It does not.

Q. And thence to the junction west of Yuma?

A. It does not.

Q. Does the showing on exhibit No. 155 include all of the main lines within the state of Arizona?

A. It does.

Q. And those are indicated by the appropriate legend and boundary marks on the face of the exhibit, are they?

A. Yes, sir.

Q. I note that at the lower lefthand side of the exhibit under the heading "Los Angeles Division, California Operation," between the stations of Indio and a point a short distance beyond Niland the profile line descends below what [fol. 2040] is apparently the base line of the exhibit. Otherwise the profile line is well above what is apparently the base line. What is the significance of that?

A. The railroad in the stretch that you referred to passes down into and out of the Colorado desert opposite Salton Sea. In other words, the track is about 202 feet below sea level.

Q. At what point?

A. At a place called Salton, it is indicated on this profile.

Q. The descent of profile line below the base line indicates the portion of the line which is below sea level?

A. It does.

Mr. Mason: Have you any questions on the exhibit, Mr. Strouss?

Mr. Strouss: No.

Mr. Mason: We offer the exhibit in evidence as defendant's exhibit No. 155.

Mr. Strouss: No objection.

The Court: It may be admitted.

(The document referred to was received in evidence and marked "Defendent's Exhibit No. 155.")

Mr. Mason: Mr. Kirkbride, I will ask you to refer now to an exhibit in one sheet bearing title, "Southern Pacific Company, Condensed Profile—Ogden Route." Have you [fol. 2041] that exhibit before you?

A. I have.

Mr. Mason: May we have the exhibit marked "No. 156" for identification?

The Court: It may be marked.

The Clerk: Defendant's exhibit No. 156 for identification.

Mr. Mason: Was exhibit No. 156 prepared by you or under your direction in your department, Mr. Kirkbride?

A. It was.

Q. From what sources?

A. From the original records, profiles kept in the office and kept up to date as changes or new lines were made from time to time.

Q. Was this exhibit prepared in the same manner as No. 155?

A. It was.

Q. And from the same type of records?

A. It was.

Q. Will you refer to the map, exhibit No. 1, on the easel and describe briefly the lines which are shown thereon and which are indicated on exhibit No. 156?

A. At the lower portion of the profile the profile conforms to the line that commences at San Francisco and [fol. 2042] passes to Redwood City and across San Francisco Bay and over the Altamont Summit, thence into the San Joaquin Valley at Tracy and through Stockton to Brighton, Elvas and over the Sierra Nevada, the summit of which is marked "Norden" and descending along the Truckee River to Sparks and then across the sinks of the Carson and up the Humboldt River across the state of Nevada to Wells and then over the Pequop Range and down into Montello and terminating at Ogden.

Q. I notice that the principal profile at the foot of the sheet shows a reference to the Western Pacific. Is that in the paired track territory in Nevada?

A. It is.

Q. Is this a profile of the Western Pacific line between the points shown?

A. The lower profile shown is the Western Pacific because that is used for eastward movement of trains.

Q. Southern Pacific trains?

A. Southern Pacific as well as Western Pacific trains.

Q. Just above the profile line of the Sacramento division you show a profile designated with the word "westward" [fol. 2043] between Roseville and Sparks. What does that indicate?

A. That is the second line construction that was carried out partially in 1907, 1913, and 1925, and it is used for westward movement of Southern Pacific trains.

Q. Is that in some parts of the district on a different alignment than the eastward track between the same points?

A. It is on a different alignment.

Q. Betwen the stations in Nevada shown in the lower portion of the exhibit to which the designation "Western Pacific" applies, you show also an alternate profile above. What does that indicate?

A. That represents the profile of the Southern Pacific extending from Alazon to Weso within the limits of the paired track.

Q. For what trains is that used?

A. That is used for the westward movements of trains.

Q. Are the Southern Pacific and Western Pacific rails on different alignments on part of the paired track territory?

A. They are on different alignments.

Q. You show also an alternate profile between Montello and Lucin at the foot of the sheet?

A. That likewise is second track construction extending [fol. 2044] from Lucin to Montello on an alignment different from the original line and used for westward movement of trains.

Q. What is the significance of the profile at the top of the sheet and to what part of the railroad shown on exhibit No. 1 does that refer?

A. Extending in a northwesterly direction from the main line at Fernley is a line that connects at Alturas. From Alturas it extends to Klamath Falls but this profile covers only the territory from Fernley to Alturas.

Q. Is that a part of the main line of the Salt Lake division?

A. It is.

Q. Does this exhibit show in the same fashion as No. 155 the boundaries of the states as well as the divisions to which the exhibit relates?

A. It does, yes, sir.

Q. Does this exhibit include all of the main lines in the states of Nevada and Utah over which the Southern Pacific trains operate?

A. It does.

Q. This exhibit and the preceding exhibit, No. 155, are both designated as "Condensed Profiles," Mr. Kirkbride. Does the fact that a profile is condensed tend to exaggerate [fol. 2045] the slope or inclination of the grade or line?

A. It greatly exaggerates the inclination because of the relationship between the horizontal and vertical scales. A condensed profile does not show the detail of profile or grade construction.

Q. Would it be possible upon a single sheet or any reasonable series of single sheets to show an exact profile of the line? How long would that sheet have to be?

A. It would take many sheets comprising large folios of profiles.

Q. Then I take it that where you have a condensed profile you use a different scale for elevation than you do for the horizontal difference?

A. Yes, sir.

Mr. Mason: Have you any questions Mr. Strouss?

Mr. Strouss: No.

Mr. Mason: Will you say whether or not exhibit No. 156 correctly reproduces the information appearing upon the original records?

A. It does.

Mr. Strouss: Just one question, you asked if there was a different scale. I notice the scale shown here, is that the horizontal or the vertical?

A. It is the horizontal.

[fol. 2046] Mr. Mason: The elevations are shown in feet, Mr. Kirkbride, are they not?

A. You will notice horizontal lines marked "1,000, 2,000, 3,000, 4,000, 5,000," as the case may be.

Q. Those indicate the vertical scale, do they?

A. Yes, sir.

Q. And the same would be true of exhibit No. 155?

A. Yes, sir.

Mr. Mason: We offer the exhibit in evidence as defendant's exhibit No. 156.

Mr. Strouss: It is objected to as irrelevant and immaterial.

The Court: Objection overruled, it may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 156.")

Mr. Mason: From your knowledge of the Arizona lines and with such reference to the profiles as you desire, will you describe briefly the main lines of the Southern Pacific in Arizona?

A. Referring to exhibit No. 155 there are, with the exception of a 37-mile stretch from Yuma to Wellton and a 46-mile stretch from Picacho to Tucson, two separate and distinct railroad lines extending in a generally easterly and [fol. 2047] westerly direction across Arizona. Describing the line first built, known as the old original Southern Pacific, the general profile characteristics are, leaving Yuma at an elevation of 136 above sea level, the gradient is variable directly out of Yuma six-tenths per cent, flattening to lower grade lines. The route follows the mesa on the southerly side of the Gila River, the Gila River flowing westward and in a general way the road follows the Gila River eastward but departs from it as if gets further from Yuma. A ruling grade of one per cent obtains in this territory by reason of a small range of hills known as the Mohawk Mountains which are surmounted by means of a one per cent grade.

Q. Is that a comparatively short grade?

A. That is a very short grade, the elevation being 540 feet. A short descent is then made on a one per cent grade and then varying grades with finally a maximum of 1.02 to obtain the height of a higher mesa.

Q. At what point does that 1.02 grade apply?

A. This applies to the immediate ascent to Sentinel.

Q. Is that likewise a comparatively short distance?

[fol. 2048] A. It is, for instance, Mohawk is 60 miles from Yuma and Sentinel is about 30 miles further. The profile then is a relatively flat grade not exceeding six-tenths per cent to Gila, which is 123 miles from Yuma and at an elevation of 736 feet. A climb is then made over the Maricopa Mountains, the summit being marked "Estrella," the elevation of which is 1,520 feet and the distance from Kuma, 142 miles. For 23 miles a descent is made on a .83 per cent to the general vicinity of Maricopa, which is in the lower basin of the Santa Cruz River, the elevation being 1,172, and Maricopa being 165 miles from Yuma. The line then follows upward along the Santa Cruz River for a distance

of 86 miles to Tucson, which is at an elevation of 2,386 feet, the distance from Tucson to Yuma being 251 miles. The line then ascends to Whetstone Mountains in a distance of 40 miles, the summit being at Mescal with an elevation of 4,062 feet. A descent is then made in 8 miles to Benson with a crossing of the San Pedro River on a 1.4 per cent. I should add that the maximum gradient eastward between Tucson and Mescal is 1.06 per cent.

Q. That is the ruling grade in that territory?

A. Ruling grade, yes, sir.

[fol. 2049] Q. That is not a continuous grade, is it?

A. It is not a continuous grade.

Q. You spoke of the 1.4 grade descending Mescal to Benson and the crossing of the San Pedro River at Benson. What is the nature of the line from Benson eastward?

A. A climb is then made on a ruling grade of 1.4 flattening to one percent to surmount the Dragoon Mountains, the crossing being made at Dragoon with an elevation of 4,613 feet, and Dragoon is 70 miles from Tucson. The descent eastward is then made on a 1.1 per cent grade into the Sulphur Springs Valley, which is crossed and designated on the profile, the easterly end of which is Willcox. The general level of this plateau, Sulphur Springs Valley, is 4,150 feet. It is then necessary to climb the Dos Cabezos range, using a ruling grade of .91 and a crossing is made at Raso, elevation 4,380, 99 miles from Tucson. From Raso a descent is made into the San Simon Valley, which is at a general elevation of 3,600 feet by a ruling grade of one per cent, this valley being shown between the point Bowie and San Simon. Leaving San Simon, the Peloncilla range is surmounted by the use of ruling grade of 1.4 per cent, the summit being at Steins, elevation 4,345 and 143 miles from [fol. 2050] Tucson. The descent is then made into another valley by similar ruling grade of 1.4 per cent and on to Lordsburg, but 3.8 miles westward from Steins the state line of Arizona and New Mexico is crossed.

Q. I am going to ask you to refer to the line from Wellton via Phoenix to Picacho. When was that line constructed?

A. 1924, 1925, and 1926.

Q. Did part of it exist prior to that time?

A. Some of the line existed out of Phoenix known as the "Arizona Eastern."

Q. Was it all reconstructed?

A. It was reconstructed.

Q. Brought up to the same standard as the new construction?

A. It was.

Q. Will you describe now that line briefly?

A. Commencing at a point Wellton, 37 miles east of Yuma, the line drops down to a crossing of the Gila River, a steel bridge being used. A varying grade system then exists, the ruling grade becoming one per cent to overcome the Gila Bend Mountains, the crossing being made at Harque. A varying grade system is then used to Phoenix, the ruling grade being six-tenths. The summit of the hill at [fol. 2051] Harque is elevation 1,078 and it is 117 miles from Yuma and the elevation of Phoenix is 1,079, 173 miles from Yuma. The same grade system prevails leaving Phoenix and crossing the Salt River at Tempe and continues on to a connection with the line previously described at Picacho, the ruling grade being six-tenths per cent, there being stretches of much flatter grade in between.

[fol. 2052] Q. You have spoken of ruling grades, of course, but are there on all parts of this line you have described, generally speaking, stretches of flatter grade?

A. There are stretches of level grade in each grade system ranging from no per cent up to the six tenths or five tenths, or one per cent, as stated.

Q. Now you also show on the profile, and I would like to have you now describe the line from Tucson via Douglas to the state line.

A. The line out of Tucson via Douglas, as previously stated, is a separate line from the old line; that is, it is not exactly parallel. The profile of the system develops up the westerly slope of the Whetstone Mountains on an almost continuously supported grade of one per cent; at Mescal Summit the line crosses over the Southern Pacific Line previously described and a descent is then made on a .3 per cent grade to Fairbank, a crossing of the San Pedro river.

Q. Just a moment, Mr. Kirkbride. I want to ask you if the line from Tucson to Mescal which you have just described, the former El Paso and Southwestern, is that part of the line shown on the profile, Exhibit 155, designated as [fol. 2053] "Track No. 1 westward"?

A. It is.

Q. Is that the line that is used for all westward trains between Mescal and Tucson?

A. It is used for westward movement of trains: it can be used by reason of the signal system for eastward movement.

Q. Normally it is the westward movement?

A. Normally, it is the westward track.

Mr. Strouss: May I ask, is that the reason for the note at the bottom, "Providing trains are operated eastward?"

A. Yes, sir.

Mr. Mason: That is to say that one per cent becomes the ruling grade if trains are operated eastward in that territory; is that the understanding?

Mr. Strouss: Yes.

Mr. Mason: Proceeding eastward then from Fairbanks, Mr. Kirkbride?

A. Well, the crossing of the San Pedro river at Fairbank is at an elevation of 3,851 feet, and 62 miles from Tucson; the line then follows along the San Pedro river for a number of miles at a relatively flat grade, and then an ascent of the Barro mountain is obtained by the use of a one per [fol. 2054] cent ruling grade; the summit being at Bisbee Junction; the elevation being 4,679, and the distance from Tucson 99 miles; a line then descends to Douglas on a grade system of less than one per cent, although there is a ruling grade of one per cent in there, Douglas being at elevation of 3,968, and 123 miles from Tucson; a climb is then made out of Douglas over certain ranges of hills, the grade varying, but the ruling grade being one per cent. At Rodeo the state line is crossed.

Q. Does the line continue on into El Paso with ruling grades of not to exceed one per cent?

A. That is true: the line then continues over various low hill summits with alternately descending and ascending grades ranging from .79 per cent to one per cent, and into El Paso, where we have an elevation of 3,719 feet, which is 339 miles from Tucson.

The Court: We will take our mid-morning recess at this time.

(Thereupon, a short recess was taken, after which the witness was recalled and proceedings were resumed as follows:)

The Court: You may proceed.

Mr. Mason: Mr. Kirkbride, in your description which [fol. 2055] you have just completed of the main lines in Arizona, you have referred a number of times to the ruling grades. Now, I will ask you whether those ruling grades are, generally speaking, continuous grades, or whether they prevail for comparatively short distances, with substantial distances of grades much less severe.

A. They are short grades and not continuous, long stretches of level or lesser grade prevailing between points.

Q. Are the lines in Arizona lines of continuous curvature or with considerable tangent tracks?

A. Long tangents and very flat curves are characteristic of the alignment.

Q. The term "tangent" is an engineering term meaning straight track, is it?

A. Tangent is a straight track.

Q. Now, have you an example of a long stretch of tangent track in Arizona?

A. From a point six or seven miles west of Maricope and extending to within a few miles of Picacho the track is tangent except for two ten-minute curves, one of the tangents being of the order of forty-eight miles in length.

Q. You say a ten-minute curve. Is that a very slight [fol. 2056] curve?

A. That is a very slight curve, and from all practical points of view is considered tangent track.

Q. Do you have long tangents on the line between Wellton and Picacho via Phoenix as well?

A. Similar long tangents exist, and between Tempe and Picacho.

Q. Now, will you refer to Exhibit No. 156, and from that exhibit and from your own knowledge of the line in Nevada and Utah, will you supply for the record a description of those lines similar to the description which you have just given of the lines in Arizona?

A. Generally speaking, the Sierra Nevada range of mountains forms the westerly boundary of the state of Nevada,

and as affecting the railroad, the descent is made off of the summit of the Sierras by 1.8 per cent.

Mr. Strouss: My objection, if the Court please, to the exhibit goes to this testimony.

The Court: Yes, and the objection is overruled.

The Witness (Continuing): Changing to a one per cent in the general vicinity of Truckee. The line follows down [fol. 2057] the Truckee river to Floriston, the state line between California and Nevada being about midway between Truckee and Floriston.

Mr. Mason: Isn't the line a little east of Floriston?

A. I should say east of Floriston, but the gradient is a one per cent. There are two lines in there and we are now describing the eastern line. The one per cent prevails until we come to Sparks, which is 246 miles from San Francisco; the Truckee river is followed on flat grades, ranging from level grade to .4 per cent to the sink formed by the Carson and Humboldt rivers, this being in the general vicinity of the point marked "Huxley," 316 miles from San Francisco, the general elevation being 3,897; the gradient then ascends on .5 and .4 per cent to Imlay, and continues on to Winnemucca. About three-and-a-half miles east of Winnemucca the connection with the Western Pacific is made at a place marked "Weso."

The Court: That is where you use the common track?

A. That is the commencement of the paired track territory, and the ruling grade is .4 to Carlin, which is 534 from [fol. 2058] San Francisco, and the grade of the line then begins to increase until a point is reached at Alazon, where the paired track ends, that is, it is the easterly end of the paired track, and the profile from there represents the Southern Pacific line to Wells, where the Pequop Mountains are surmounted by a ruling grade of 1.5 per cent.

Q. Is that practically a continuous grade from Wells to Moor?

A. Practically so. 1.5 per cent for about nine miles. The Pequops form a high plateau of a general elevation of 6,200 feet, and the line passes over this plateau on a ruling grade of .4 per cent to Valley Pass, elevation 6,072 feet. A descent is then made on a descending grade of 1.4 per cent ruling and a distance of 21 miles to Mostello, which is

662 miles from San Francisco, and a .2 per cent grade exists for some distance.

Q. You are describing the eastward track now?

A. I am describing the profile at the bottom of the sheet, which is the eastward track; a descent being made into the general territory known as the Salt Lake Desert and passing through Lemay, Strong Knob and Midlake to Ogden, which is an elevation of 4,300 feet. The line leaves the state of Nevada and enters Utah about 3.8 miles west [fol. 2059] of Alazon.

Q. Does the line cross the Great Salt Lake in the territory west of Ogden, as shown on the profile?

A. The mid-point of the crossing of the Great Salt Lake is designated on this profile as Midlake.

The Court: Well, is that across what is known as the Lucin Cut-off?

A. The Lucin Cut-off extends from Lucin to Ogden, a distance of about a hundred and two miles, and in that territory thirty miles represents the crossing of the Great Salt Lake, and contained in that thirty miles is a long trestle eleven miles in length, Midlake being a station at about the mid-point of that trestle.

Mr. Mason: Now, what are the westward ruling grades in the territory you have just described?

A. By referring to the profile marked "westward" and immediately above the words "Western Pacific" the profile commences at a point marked "Alazon," the descending grade being in the nature of .4 per cent, .5 per cent, leveling off to .4 per cent, and then changing to ruling grade of .64 per cent.

[fol. 2060] Q. This line between Wells and Lovelock on both railroads in the paired track territory lies generally along the Humboldt River?

A. That is true, the Humboldt River extending—the origin, the head waters of the Humboldt River being at Wells and the water disappearing in a common sink with the Carson River in the general vicinity marked "Huxley."

Q. Now, you show here in alternate profile Lucin to Montello with 1.4 per cent. Does that indicate a maximum western ruling grade of 1.4 from Lucin to Montello?

A. That is true.

Q. And the western ruling grade between Sparks and the state line near Floriston, is that the 1.1 or 1.6 that is shown in the upper profile near the center of the sheet?

A. There is a 1.6 per cent grade out of Sparks, then the Truckee River is followed to Truckee on a 1.1 per cent.

Q. Now, is there continuous curvature on these lines in Nevada and Utah, or are there substantial distances of tangent track?

A. There are long stretches of tangent track and flat curves ranging from no degrees and thirty minutes to four [fol. 2061] degrees, with a few six degree curves.

The Court: Well, Mr. Kirkbride, the route that you have described here from San Francisco to Ogden, generally speaking, is a much more mountainous route than anything you encounter across the State of Arizona?

A. It is mountainous in this respect that there are two high mountain ranges, the Sierra and then the Pequops, and the entire territory is at a higher elevation, namely ranging from 4000 to over 6000 feet.

Mr. Mason: Isn't it also a fact, Mr. Kirkbride, that the mountains, the severest mountains on this route, are those in California; that there are no severe mountain ranges in Nevada or Utah?

A. Not within the state of Nevada or Utah. The Wasatoh high range exists east of our property at Ogden.

Q. No, in respect to tangent track and curvature from the Nevada state line eastward, is the situation in Nevada and Utah substantially the same as you have described in Arizona?

Mr. Strouss: Now, I object to that as calling for the conclusion of the witness. The exhibits are before the Court, [fol. 2062] and if there is any evidence as to what the curves are, the degrees of curve, that may be put in, but the question of comparison is a matter for the Court to determine from the evidence.

The Court: Well, Mr. Strouss, it occurs to the Court that in a matter of this magnitude, a matter involving the operation of railroads, with which this Court is not familiar, that this opinion evidence put in within proper limits, might be helpful to the Court. I will overrule the objection to the question. He has now a factual basis on which to offer an opinion; we didn't have that yesterday.

Mr. Strouss: Well, only to the extent that he himself, an interested witness by reason of his employment by the defendant, has in a general way described the territory so far as curves and tangents are concerned. He has referred to the exhibit which is already in evidence, so far as grades are concerned. Now, the exhibit speaks for itself, so far as grades as concerned; I submit, anyone can look at that and see what the comparison is as to grades.

Mr. Mason: I wish that the question might be read.

(Thereupon, Mr. Mason's last question was read by the [fol. 2063] reporter.)

A. They are.

Mr. Strouss: My objection is, of course, renewed to that.

The Court: Yes.

Mr. Strouss: It calls for a conclusion and a comparison.

The Court: It does call for a conclusion, and an expert witness such as this, where it will be helpful is entitled to give that conclusion. The objection is overruled; the answer may stand.

Mr. Mason: Now, referring to the line between Sparks and Ogden, all of which is in Nevada and Utah, as shown by your exhibit, Mr. Kirkbride, and the line between Yuma and El Paso, all of which is in Arizona and New Mexico, as shown by your other exhibit, will you state, first of all, what is the total road mileage between Sparks and Ogden eastward?

A. 531.2 miles.

Q. And what is the total mileage between Sparks and Ogden westward?

A. 536.8 miles.

Q. And what is the total miles of curved track westward between Sparks and Ogden?

A. There is 102.5 miles.

[fol. 2064] Q. Is that eastward or westward?

A. That is eastward.

Q. Now, between Sparks and Ogden westward, what is the total mileage of curved track?

A. 116.8 miles.

Q. Now, taking the route between Yuma and El Paso via Gila, Tucson, and Lordsburg, what is the eastward mileage?

A. 563.7 miles.

Q. And what is the westward mileage between those two points over that same route?

A. 562.8 miles.

Q. And what is the total mileage of curved track eastward between Yuma and El Paso via Gila, Tucson and Lordsburg?

A. The curved track, ranging from no degrees of curvature to six degrees, amounts eastward to 79.4 miles, but the curvature over six degrees is 5.5 miles.

Q. Now, without particularizing as between curvature up to six and over six, what is the total of the curved track westward between Yuma and El Paso?

A. 84.3 miles.

Q. Now, what is the mileage of the Phoenix line, Wellton to Picacho?

[fol. 2067] A. 209 miles.

Q. And what is the total amount of curved track in the Phoenix line?

A. 18.5 miles.

Q. And the mileage over the south line between Mescal, Arizona, and Anapra, New Mexico?

A. 51.7 miles.

Q. That is the line from Mescal via Douglas up to the Junction point?

A. It is.

Q. What was the figure you gave?

A. 51.7 miles.

Q. Of curved track?

A. Yes, sir.

Q. What is the total mileage?

A. 295.3 miles.

Q. Mr. Kirkbride, does the company prescribe a maximum authorized speed for freight trains moving over its lines with regular freight equipment?

A. It does.

Q. What is that maximum authorized speed?

A. 35 miles.

The Court: Pardon me just a minute. You are speaking now of its general lines——

Mr. Mason: Yes.

[fol. 2066] The Court: Not limiting it to any particular state.

Mr. Mason: I will bring that out later.

The Witness: 35 miles an hour, and in some cases 40 miles an hour.

Mr. Mason: Does that maximum limitation apply in Nevada?

A. It does.

Q. Utah?

A. Yes.

Q. Does it likewise apply in Arizona?

A. It does.

Q. And New Mexico?

A. Yes.

Q. Is there any different maximum speed authorized on the lines, whether in Arizona, New Mexico, Nevada or Utah, because of 85 or 90-pound rail in the track in one locality as compared with 110-pound in another locality, referring only to freight trains?

A. There is no speed restriction, 35 and 40 miles being authorized over such weights of rail.

Q. The same maximum speed is authorized whether the rail be 85-pound or 110-pound?

A. That is true.

Q. Does the same apply if the rail is 130-pound?

[fol. 2067] A. That is true.

The Court: Then do I understand, from your testimony, that you have a rule on your railroad in all of the states named, including Arizona, that prohibits the engineer running a freight train at a maximum speed in excess of forty miles an hour?

A. The authorized speed. That is true, except that there is a certain tolerance permitted of five miles in case an engineer was found to be slightly exceeding forty miles.

Mr. Mason: Is that tolerance permitted for the purpose of making schedule or merely for the purpose of discipline?

A. I understand it is for discipline.

Q. Does any such tolerance appear in the time-tables?

A. No, sir.

The Court: Might the word "latitude" be another term for this which you call tolerance?

A. Yes, sir.

The Court: Given that much latitude, the authorized speed is not to be over forty miles an hour in the territory specified, other territories it would be 35 miles an hour.

(No answer.)

[fol. 2068] Mr. Mason: Now, Mr. Kirkbride, is the same latitude or tolerance permitted whether the track on which the speed is made is 130-pound rail or 85-pound rail, or anything between?

A. The same tolerance is permitted. In other words, the track hasn't anything to do with it.

The Court: When you say that the track has nothing to do with it, you mean by that that you consider all of your tracks sufficiently stable that you are able to operate at the maximum speeds that you have indicated?

A. All of our main line tracks.

Mr. Mason: Mr. Kirkbride, are you familiar with the term "axle weight," or weight per axle, as used in connection with rolling equipment, particular locomotives?

A. I am.

[fol. 2069] Mr. Mason:

Q. Mr. Kirkbride, can you determine the axle weight of the locomotive given the weight on drivers and the number of driving axles?

A. I can.

Q. That is to say, you can at least determine the average weight per axle?

A. Yes, sir.

Q. From the standpoint of the weight of the rolling equipment as it passes over the rails or the roadbed or the bridges and may affect them, is the axle weight of the locomotive or the cars in the train of any significance, and, if so, what is the significance?

A. The weight and axle loading of the locomotive is controlling. If a track or structure will take a locomotive, it will take any of the cars behind the locomotive.

Q. Is the track so designed to bear the weight of the axle loading of the locomotives?

A. It is.

Q. Are the bridges and other structures similarly so designed?

A. They are so designed.

Q. Will you please refer to exhibit No. 5 introduced by Mr. Russell and by reference to the tabulation on the right [fol. 2070] hand side of the exhibit will you compute the

average axle load, so-called, of the Southern Pacific type locomotive referred to on that exhibit?

A. The axle loading is 63,400 pounds.

Q. How do you arrive at that figure?

A. The total weight of the locomotive on the drivers is 317,000 pounds. There are five drivers, hence if we divide by five, the result is 63,400.

Q. You say that there are five drivers, you mean five driving axles?

A. Yes.

Q. Ten drivers as indicated by the nominal classification of 4-10-2?

A. Yes, sir, wheels.

Q. Will you from the same exhibit calculate the average axle loading of the Articulated Consolidation locomotive AC-8, which is shown next to the last in the tabulation?

A. 66,462.

Q. 66,400 pounds approximately?

A. Yes, sir.

Q. Was that obtained in the same way, by dividing the indicated figure of weight on drivers by the number of axles?

A. It was. 531,700 total weight on driving axles and [fol. 2071] there are eight axles, so dividing by eight we get 66,450.

Q. Are the Southern Pacific type locomotives shown on exhibit No. 5 regularly operated in freight service on the Tucson division?

A. They are.

Q. Between what points?

A. Lordsburg and El Paso.

Q. On the Tucson division?

A. Tucson to Lordsburg.

Q. Are they operated over the double track between Tucson and Mescal in both directions?

A. They are.

Q. Have Articulated Consolidation locomotives of the AC-8 class ever been operated in freight service on the Tucson division?

A. I can't answer that question. They were operated at the beginning of the year in an experimental way. I can't state as to the continuous operation of them.

Mr. Strouss: Beginning of what year?

A. 1940.

Mr. Mason: Does the company operate the AC-8 class locomotive with the cab in front and the AC-4 with the cab in front referred to on exhibit No. 5 in regular freight serv-
[fol. 2072] ice on the Los Angeles division?

A. That is correct, between Los Angeles, Burbank and Mohave Bakersfield.

Q. That includes a portion of the San Joaquin division, does it?

A. It does.

Q. Are they operated between Roseville and points in Oregon?

A. They operate from Roseville to Gerber up to the Sacramento Valley and from Gerber to Klamath Falls and on over the Cascade Mountains down to Klamath Falls, Oregon.

Q. On this road between Los Angeles and Bakersfield, what is the approximate distance in miles?

A. It is over 200 miles.

Mr. Mason: Do you mind, Mr. Strouss, if the witness refers to a timetable?

The Witness: I believe it is 167 miles.

Mr. Mason: In that extent of 167 miles, Mr. Kirkbride, is there any 90-pound rail in the track over which these locomotives operate?

A. There are very considerable stretches of 90-pound rail.

Q. About how much mileage altogether?

A. I would say about 60 miles.

Q. On the district between Roseville and Gerber, Califor-
[fol. 2073] nia, over which these AC locomotives operate, is there any 90-pound rail in the track?

A. There is.

Q. Can you state the approximate mileage between Roseville and Gerber and the approximate proportion of that which is 90-pound rail?

A. I think it is about 110 miles and I would judge that three-quarters of that mileage is 90-pound rail.

Q. On the west side of the Sacramento River between Davis and Gerber do these locomotives operate in that territory as well?

A. I don't know.

Q. In the territory between Lordsburg and El Paso over which you stated the five thousand class locomotive operates, is there any 85 or 90-pound rail in that territory?

A. There is quite a considerable amount of 85 and 90-pound rail.

Q. Where is the 85?

A. The 85 on the former E. P. & S. W. line out of Tucson extends to Mescal and then on to Douglas in stretches.

Q. Between Lordsburg and Tucson it is on the westward track from Mescal to Tucson, is it?

A. Yes, sir.

[fol. 2074] Q. There is 85-pound as well as other weight of rail in that section?

A. What is the question?

Q. Is there 85-pound as well as other weight of rail in that section?

A. Yes, sir.

Q. Between Mescal and Lordsburg via Bowie is there 90-pound rail in part of that track?

A. There is 90-pound rail.

Q. Have you made any study of the effect upon the rail in the track of the operation of these Southern Pacific type and AC type locomotives in the territories to which you have referred?

A. I have.

Q. Will you state what effects or results have been observed?

A. We test the sufficiency of any rail section as to strength by calculating the fiber stress in the base of the rail set up by any particular locomotive operating at certain designated speeds, and we then permit the operating department to operate their locomotives conforming to the allowed limits of stress in the rail. Our calculations show that the 90-pound as well as the 85-pound rail to be of sufficient strength for the locomotives that are being operated over the railroad.

[fol. 2075] Q. Do you by inspection or other means confirm the results of your calculations as to these particular stretches of rail?

A. We are constantly inspecting track in connection with the maintenance and studying the effect of wheel loads thereon.

Q. Do you employ any particular type of apparatus for that purpose?

A. For testing the rail?

Q. Yes, and inspecting for any defects which may be the result of the locomotive operation.

A. Our system basically gets back to the section foreman who is in responsible charge of a designated section, say ten miles, and he is in daily contact with the section, observing the condition of the track with particular reference to the rail, thus noting any characteristics of failures or defects that may be indicating themselves. From time to time the road master would instruct the section foreman to put on a special patrolman for that purpose and some of the special patrolmen that we have are designated as "Sands mirror inspectors." In other words, it is very difficult for a man to look under the ball of the rail, but by having a small device whereby a mirror of strong magnifying power is supported on wheels, the operator [fol. 2076] shoves the device along the top of the rail and by glancing in the mirror he sees the true condition of the underside of the ball. Obviously he himself can see the condition of other parts of the rail. Further, he has the benefit of signals because any break in the rail structure immediately sets the signal at "Stop" so that the track man as well as the signal maintainer is able to have immediate indication of a defect such as a broken rail because of the signal being at "Stop" with no other apparent cause for it. An inspection being made of the distance between the signals will show up the broken rail if it exists. We further amplify that inspection by the operation of a Sperry detector which is in constant operation over our system, where by reason of a drop in the potential—basically speaking, the application of magnetism and electricity—we are able to record on moving sheets of paper any internal defect that exists in the rail, and if a rail is developing an internal defect such defect is caught by the detector car apparatus and if an examination of that rail at that particular point proves the defect there, even though the rail is not broken, the rail is immediately removed from track, a section gang following along behind the detector car so [fol. 2077] that they may be available for the purpose of removing the defective rail.

Q. Using all of these methods of inspection and detection of rail defects, will you say whether or not in 90-pound and 85-pound sections over which these heavy locomotives referred to in your testimony have been and are now being operated, the result is to develop any higher or greater fre-

quency of defects in the rail than in other territory where greater weights of rail are in tracks.

A. It is hard to distinguish between 85 and 90-pound and greater weights of rail with reference to defect and failure because such failures originate by reason of defects in manufacture, and the weight of the rail has little relationship to it.

Q. Broadly speaking, do you have any more rail trouble in the 85 and 90-pound sections over which these heavy locomotives operate by reason of the operation of those locomotives than you do in other sections?

A. We have little trouble from the 85-pound rail.

Q. I am addressing my question now to defects in the [fol. 2078] rail which arise by reason of the operation of these locomotives over that rail. Do you have any more in the 85 and 90-pound sections than you do in the other sections?

A. I would say there is little difference.

The Court: Mr. Kirkbride, how frequently do you operate these detector cars over your line?

A. We have one detector car that operates continuously and we also hire or rent the services of another car from the Sperry Company, the result being that we cover our property so that any particular mile is inspected at intervals of six months or eight months. In some cases, the inspection will be only a few months apart but the average will be six or eight months.

The Court: The court will be at recess until two o'clock P. M.

(Thereupon the court stood at recess until two o'clock P. M., January 9, 1941.)

[fol. 2079] 2 P. M., January 9, 1941.

All parties being present as heretofore noted, proceedings were resumed as follows:

W. H. Kirkbride resumed the witness stand.

Mr. Mason: At the noon recess, Mr. Kirkbride, you were referring to the operation of the detector car. Do you use the defector car in Nevada, as well as in Arizona?

A. We do.

Q. Do you use those other methods of rail and track inspection that you have described in Nevada as well as in Arizona?

A. We do.

Q. And on all other parts of the system?

A. It is common practice on all other parts of the system.

Q. What factor determines the length of the time that rails are to remain in main line track?

A. Tonnage life is one of the controlling factors so far as tangent track and light curved track is concerned. On curves of our mountain grades the controlling factor is the amount of metal that we permit to be worn off the ball of the rail. In the latter case we have certain curve worn tem- [fol. 2080] plate standards set up and before the curve is changed out a scribing machine is used to determine the amount of metal worn away from the ball, and if the rail is approaching the limit of wear then the rail is programmed for renewal. On tangent track the basic factor is the tonnage life, that is, the number of gross tons that the rail will handle during a period of, say, twenty or thirty years.

Q. The tonnage life of the rail is the amount of gross tonnage that passes over it from the time it is placed in the track until it is withdrawn is that correct?

A. That is correct.

Q. Do you have certain tonnage limits to which you work in determining when rail is to be replaced in main track?

A. We have certain tonnage limits that are used as a guide upon which to make critical examinations of the rail. When a rail begins to approach its tonnage life, there are certain physical characteristics which begin to show up like a worn condition on the top of the rail, so called "black spots," fillet cracks in the ball and that condition is determined by physical examination.

The Court: I presume every new rail that is placed on [fol. 2081] the roadbed is stamped with the year it is installed?

A. It is stamped with the year that it was rolled, not the year of installation. The manufacturer's brand is on the rail, the weight and section of the rail is stamped and the heat number. That is to say, there are a certain number of rails that will come out of a heat from the furnaces, open hearth furnaces, and a record is made of that by the

inspectors as the rail goes through the mill. We keep a perfect record of the number of rails in a heat and then we keep a record of the performance of the individual heats.

Mr. Mason: Do you also keep a permanent record of the year and day when the rail is placed in the track?

A. We keep a permanent record of the time of laying the rail.

Q. Do you also keep a record of the gross tonnage passing over that rail from and after the date of its laying?

A. We do, we keep a cumulative record of the tonnage so that at any time within a year the tonnage life of that rail may be known.

The Court: I take it from your testimony that that tonnage isn't down to an exact science, that is, it wouldn't be [fol. 2082] true in every instance that after so many tons had passed over that rail that the rail would be ready to be cast aside?

A. It is only a guide.

The Court: It is only a guide, not an exact science?

A. Not an exact science or rule.

The Court: Is there a deterioration in these rails between the time that they come from the mill and the time that they may be installed on the road, say after a year or so elapses?

A. No deterioration.

Mr. Mason: Mr. Kirkbride, does the mere age of the rail, apart from the tonnage passing over it, have any particular effect upon its usefulness?

A. The age has no effect. To illustrate the point, you might lay a certain section of rail in a branch line where climatic conditions were dry and the tonnage over that branch line was very light and the rail at the end of fifty years would be practically as good as when it was laid, whereas on a main line where the gross tons moving over the rail was large as compared to the branch, the rail would last only, say, twenty years, or less or more.

Q. Do climatic conditions have any effect upon the life [fol. 2083] of rail?

A. They do. We find that the rail laid along the Pacific Ocean on our coast line between San Francisco and Ventura is subject to corrosive attack by reason of the sea breezes. A similar condition existed in the tunnels, there

being some 37½ miles of tunnels on the Pacific lines, and we find that the gases ejected from the locomotive stacks combine with the moisture in the air within the tunnel, which in turn creates a vapor or moisture that settles on the rail, and a very corrosive condition develops whereby we get only possibly one-third of the life of rail in those tunnels as compared to the rail immediately outside in the open air.

Q. Are there any tunnel conditions or salt air conditions in Arizona which have any substantial effect on the life of rail?

A. There are no such conditions in Arizona and none in Nevada.

Q. Are there in Utah?

A. In Utah by reason of the Great Salt Lake.

The Court: What would be the average life of your rails, say, on your main line in Arizona?

A. There again a question of tonnage enters into it, but twenty——

[fol. 2084] Mr. Strouss: (Interrupting) You are speaking about what weight of rail now?

A. We would get a life of twenty to twenty-five years from the 90-pound rail.

Mr. Mason: That is on the main freight line?

A. Yes. For instance, we now have rail that is twenty years old in the 85-pound rail on the E. P. & S. W. which was laid in 1912.

The Court: Would the 110 and 130-pound rails last correspondingly longer?

A. If you assume the tonnage to level off and be similar and not to increase, then we would get a proportionately greater life.

The Court: That is merely an expectation by reason of the fact that as yet any such rails have not been in use over that length of time?

A. We haven't had the 110 and 130 and 131-pound rail in use long enough to definitely say what life we are going to obtain from such weights of rail.

The Court: One other question, when you speak of the ball of the rail, you mean, I take it, the top of the rail where the wheels from the passing cars go on?

A. That is correct.

[fol. 2085] Mr. Mason: Now, Mr. Kirkbride, let us assume a train of 125 freight cars being handled by an AC Class locomotive such as is shown on Exhibit No. 5, and restricted to the speed of 35 to 40 miles an hour, which you mentioned, and a passenger train, let us say, of ten cars being handled by a mountain type locomotive of the type shown on Exhibit No. 6, and moving at allowed passenger train speed. By the way, what are the allowed passenger train speeds for Mountain type locomotives on main lines?

A. Sixty-five miles an hour, except that on the Coast lines between Los Angeles and San Francisco, we operate at seventy-five miles an hour.

Q. Now, assume this ten-car passenger train with Mountain type locomotives, Mt-1 Class, moving at the maximum speed of 65 miles per hour, which of those two trains would require the heavier rail?

A. Well, the passenger locomotive.

Q. Would the requirement be influenced at all by the number of cars behind the locomotive?

A. The cars behind the locomotive is not a factor.

Q. Why would there be a requirement of heavier rail for [fol. 2086] the passenger locomotive at the higher speed than for the freight locomotive at the lower speed?

A. Because the passenger locomotive operates at a greater speed than the freight locomotive.

Q. Now, as between the AC locomotive and the Mountain type locomotive, Exhibit No. 5 indicates that the AC locomotive, if of the AC-8 Class, would have a weight on drivers of approximately 532,000 pounds, where as the Mountain type locomotive would have a weight on drivers of 246,000 pounds, or approximately one half. Do I understand, then, that the lighter locomotive handling the passenger train would, nevertheless, require the heavier rail because of the higher speed?

A. That is correct, by reason of the following basic factors: The stress in the rail is the function of speed, the axle load conveyed to the rail by the individual drivers and the reciprocating parts, and the question of whether or not the locomotive is properly counterbalanced. The dynamic augment that develops by reason of the reciprocating parts revolving at high speed, the engine moving at high speed, added to the static wheel load creates certain stresses in the rail.

The Court: What do you mean by the locomotive being [fol. 2087] properly counterbalanced?

A. Well, a steam locomotive has certain reciprocating parts on the outside of the drivers by which the power of steam is conveyed through these rods and the piston to cause the driver wheels to revolve. Now, there is an unbalanced load on the outside of that wheel, a very heavy load, represented by the large pin that comes out and holds certain rods, and as that wheel revolves there would be a blow struck that would immediately break the rail if it were not for the fact that the locomotive builder counterbalances his driver by putting in certain counterbalancing weights that bear closely the same weight as the reciprocating part. Now, it is impossible to perform that balancing of weights in a theoretical manner perfectly counterbalanced, therefore, the locomotive designer goes to the design of the spokes of his driver and by other scientific methods of adjusting the weights and keeping the rod weights down low, he is able to reduce the dynamic augment very materially as compared to a locomotive that was not properly counterbalanced.

The Court: Then that counterbalancing takes place entirely within the locomotive itself and has nothing to do [fol. 2088] with the number of cars that the locomotive may be hauling?

A. It has nothing to do with the number of cars behind the locomotive.

Mr. Masoir: Does it have any effect on the number of cars a locomotive may handle?

A. It has no effect.

Q. Now, you have spoken of the dynamic augment and, I believe, contrasted that with the static load. Do I understand the static load is the weight of the locomotive as it stands still?

A. As it stands still.

Q. And when a locomotive is in motion, the very fact of its motion, plus its weight, adds a certain amount to the blow that is struck on the rail as it proceeds along?

A. That is correct.

Q. And the greater the speed, the greater the additional blow that it strikes in proportion to the square of the speed?

A. Approximately so, yes, sir.

The Court: That is the reason why, then, there is a greater stress with your passenger trains on the rail than there would be with the heavier freight train?

A. That is correct.

[fol. 2089] Mr. Mason: Is that increase because of the motion and because of the square of the speed, or approximately the square of the speed, what you call the dynamic augment to the static load?

A. Yes, sir.

The Court: There was just one other question: With these Super-Chiefs and these extremely high-speed trains that are run, the stress on those rails must be something terrific with the trains running 100 miles an hour.

A. To the contrary, Your Honor, a train pulled by a Diesel locomotive doesn't have this problem of dynamic augment, for the reason that there are no reciprocating parts on a Diesel locomotive, which power unit is a gasoline engine that operates and generates electricity, which in turn is conveyed to motors attached to the axles and, furthermore, the center of gravity of a Diesel locomotive is not as high above the top of the rail as a steam locomotive, and the result is that you can run a Diesel locomotive at higher speeds over a given weight of rail and the stress in the rail will be less than with a steam locomotive.

The Court: Well, then, with all of these high-speed trains, [fol. 2090] the motive power is really from the Diesel engines?

A. Not necessarily, because the manufacturer of the steam locomotive, in order to compete with the Diesel locomotive, began to improve the design of his steam locomotive. One of the great improvements, just what I mentioned, in properly counterbalancing the locomotive. In former years when steam locomotives were held down to speeds of fifty or sixty miles an hour, they weren't propery counterbalanced as we now know, and the steam locomotive builder had to overcome that deficiency, and that is one of the reasons why the maintenance of way men said, "No, you can't run these locomotives any faster than the speed we specify, because you will set up stresses in the rail that will be too much." The result is that the steam locomotive man is now able to make locomotives that will run 100 miles an hour.

We operate a steam locomotive on the Coast Lines at 75 miles an hour.

Mr. Mason: Is that a regularly scheduled operation?

A. The daylights run at 75 miles an hour, regular scheduled operation, two daylights each direction daily, and I believe—well, I know that the Hiawatha, for instance, [fol. 2091] runs at 100 miles an hour, Chicago to Milwaukee. It is not desirable to run these locomotives at the higher speeds because the cost of maintenance goes up. If you can afford the increased cost of maintenance and traffic conditions demands, you run the train at higher speeds.

Q. Did you make any changes in the weight of rail on the Coast Lines before the 75-mile schedules were placed in effect on the Daylight?

A. I did.

Q. What were those changes?

A. Well, we started a program——

Mr. Strouss: If the Court please, I haven't objected, but it seems to me we are an awfully long ways from the question before the Court now. It is interesting, but we have a long ways to go in this case yet.

Mr. Mason: Did you place heavier rail in the track of the Coast Lines division where these 75-mile an hour trains were operated?

A. We did.

Mr. Strouss: I object to that.

The Court: Overrule the objection.

Mr. Mason: Suppose that you have in the track 90-pound or 85-pound rail, the tonnage life of which is not exhausted, [fol. 2092] if heavier rail than 90 or 85-pound is placed in the track in place of that 90-pound rail, what purpose is accomplished?

A. To permit passenger trains to operate at higher speeds.

Q. What other effect, if any, is accomplished?

A. To reduce maintenance expense.

Q. Is it necessary to place rail heavier than 85 or 90 pound in the track in order to permit long freight trains to be operated?

A. It is not.

Q. Do you have a regular program of changing out rail on the Pacific Lines, including the lines in Arizona and Nevada?

A. We do.

Q. What factors are considered in determining your rail change-out program?

A. We consider the factor of the tonnage life and the worn condition of the rail, the worn condition of the rail on curves, and operating necessities.

Q. Does that include the demand for higher speed passenger trains?

A. That is correct.

Q. And has that demand or prospect of higher speed passenger operation governed to some extent in your changing [fol. 2093] out of rail in Nevada in recent years?

A. It has.

Q. Now, if passenger trains are not increased in speed, Mr. Kirkbride, is it necessary to change out ninety or eighty-five pound rail which still has a useful tonnage life in order to permit more cars to be operated in passenger trains?

A. It is not necessary.

Q. Have you before you a statement in one sheet, Mr. Kirkbride, entitled, "Southern Pacific Company, Development of Rail Sections?"

A. I have.

Mr. Mason: May this be marked No. 157, if the Court please?

The Court: It may be marked.

The Clerk: Defendant's Exhibit No. 157 for identification.

Mr. Mason: Did you cause this exhibit to be prepared, Mr. Kirkbride?

A. I did.

Q. It was prepared in your office?

A. It was prepared in my office.

Q. From what sources?

A. From the basic drawings showing in detail the design [fol. 2094] of the rail sections upon which we have the manufacturers roll the rail.

Q. On which the manufacturers roll the rail?

A. On which the manufacturers roll the rail.

Q. Does this exhibit represent rail sections which have been or presently are in the tracks of the Southern Pacific Company?

A. It represents the various sections of rail from 75 pounds per yard up to the rail which we are about to lay in the year 1941, shown as 132-pound, head-free.

Q. Is the exhibit a true and correct representation of the underlying sources?

A. It is.

Q. Does this showing relate particularly to rail sections which have been or are, as to the last item, to be placed in the tracks in Arizona and Nevada, or either state?

A. It does.

Mr. Mason: I will say, Your Honor, that we propose further to show in mileage figures the replacements of rail and the extent of rail of various weights in the tracks of Arizona and Nevada, and this exhibit will, if admitted, illustrate that testimony. Have you any questions, Mr. Strouss?

[fol. 2095] Mr. Strouss: No.

Mr. Mason: We offer the exhibit in evidence as Defendant's Exhibit No. 157.

Mr. Strouss: No objection.

The Court: It may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 157.")

The Court: Do I understand, Mr. Kirkbridge, that the lightest rail that you have on any of your main lines is now 75 pound rail?

A. That is correct. The important main lines, principal main lines, involve 85, 90, 130, 110, 112 and 131-pound rail.

The Court: I wasn't just clear as to another point. Do I understand that these particular rails shown on this exhibit were made specially by the steel mills for the Southern Pacific and that they would differ necessarily from the rails used on other roads?

A. No; the railroads in the United States have an organization known as the American Railway Association, or from an engineering point of view the American Railway Engineering Association. This association consists of committees of engineers of the various railroads. They study [fol. 2096] these problems of rail, ballast, roadbeds, and

all other matters pertaining to track and bridge construction, and it is largely on the recommendation of these committees that the railroads adopt a certain section of rail. They don't necessarily have to, but they follow very closely or entirely the judgment of the recommendations. For instance, the 90-pound rail is a standard section common at one time in the United States, and the 110-pound, 112-pound, 130-pound, 131-pound, are exclusively A. R. A. standards of rail sections. Now, I may explain, Your Honor, that individual railroads, or people that deal in the sale of rails sometimes promote some special feature and claim great advantage therefrom. That explains what we mean by the term "head-free." You will notice that by looking at the section illustrating the 113-pound and the 132-pound, that the lower corners of the ball of the rail are cut off. Certain people called attention to the fact that that lower corner is never subject to wheel wear and that a greater life would be obtained from the rail if that metal was put on top of the ball. Now, we have been experimenting over a period of years, as well as other railroads in the United States, with that special section of [fol. 2097] rail. In all other respects it conforms to the standards and the chemistry prescribed by the rail committees of the American Railway Engineering Association. The result of our experiments, as well as the results obtained on other railroads, led us to adopt those two sections of rail for this coming year, with the expectation that we are going to very materially increase the life of the rail, as will be illustrated by the fact that in the case of the 132-pound head-free rail, the height is seven and five-sixteenths inches compared to the standard 131-pound rail with a height of seven and one-eighth inches. There is a difference in height, an increased difference in height there of those two rails. Now, all other features of those rails are similar to the 131-pound.

[fol. 2098] Mr. Mason: Except for the two cross-sections which are shown for the year 1940, are all of these others standard sections of the type ordinarily found or previously found in railroads generally?

A. They are.

Q. I think you said that the minimum weight of rail in any of our principal main lines is 85 or 90 pound?

A. That is true.

Q. Have you before you an exhibit in one sheet entitled "Southern Pacific Company, Development of Roadbed"?

A. I have.

Mr. Mason: May we have this exhibit marked as No. 158?

The Court: It may be marked.

The Clerk: Defendant's exhibit No. 158 for identification.

Mr. Mason: Was this prepared in your office and at your direction?

A. It was.

Q. From what sources was it prepared?

A. From our standard drawings that have been officially adopted from time to time to be used for the direction of [fol. 2099] our trackmen in maintaining their track.

Q. Is this a correct reproduction of these standard drawings?

A. It is.

Q. Are these the standards of cross-section of roadbed which have prevailed or now prevail on the Southern Pacific for the various types of ballast shown?

A. It is correct. It should be known, however, that the three top sections are obsolete standards and that we conform to the sections shown at the bottom of the sheet under present-day practice.

Mr. Mason: Have you any questions, Mr. Strouss?

Mr. Strouss: No, I think not.

Mr. Mason: Probably some further explanation of the exhibit is desirable but it would entail a discussion of the face of the exhibit so I will offer the exhibit now as defendant's exhibit No. 158 in evidence.

Mr. Strouss: No objection.

The Court: It may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 158.")

Mr. Mason: Mr. Kirkbride, looking at exhibit No. 158, the [fol. 2100] solid black cross-sections of course are the cross-sections of the rails as they appear on the roadbed, are they?

A. That is correct.

Q. What is the rectangle in each illustration that appears immediately below the rails?

A. That is a cross-tie.

Q. Below and surrounding the tie, particularly in the lower illustration, what is the material shown there?

A. That is the ballast that is under and around about the tie.

Q. And below the ballast what does the line undertake to indicate?

A. That is foundation grade, representing the embankment or railroad cut upon which the track structure is supported.

Q. In the various illustrations, particularly the lower two, the space immediately below the center tie in each case is left blank. Is that for convenience in making the drawing?

A. These drawings were made just to be illustrative in a graphical sense. If I may say by referring to the lower drawing that our present standard ballast section provides for 8 inches and in some cases 12 inches depth of ballast [fol. 2101] below the tie, the tie being 7 inches deep, 9 inches wide, and 8 feet long.

Q. What I meant to ask you was, this, is the material which is shown opposite and under the ends of the ties also filled in under the middle of the ties?

A. That is completely filled in between the ties up to the top of the ties.

Mr. Strouss: I will agree that they don't bridge them.

Mr. Mason: Is this solid line below the material shown as ballast, is that sometimes referred to as the subgrade?

A. That is correct.

Q. In the illustrations for 1895, 1905, and 1930, you show an additional appliance or device in cross-section immediately under the base of the rail. What is that?

A. That is a tie plate.

Q. Just what is a tie plate?

A. A tie plate is a rectangular piece of metal especially rolled to be placed between the tie and the rail for the purpose of adding greater support to the rail to prevent its cutting into the tie and to permit the spiking of the rail to true line and gauge. There are four spike holes through [fol. 2102] a tie plate, permitting spikes being driven on the inside of the flange and on the outside of the flange.

The Court: Does that tie plate more evenly distribute the load over the tie itself?

A. Yes, sir, it acts as a very useful purpose in distributing the load uniformly to the entire tie surface.

Mr. Mason: Have you an exhibit which illustrates the development of tie plates?

A. I have.

Q. Being in one sheet and entitled, "Southern Pacific Company, Development of Tie Plates"?

A. I have.

Mr. Mason: We ask that that exhibit be marked No. 159.

The Court: It may be marked.

The Clerk: Defendant's exhibit No. 159 for identification.

Mr. Mason: Was this exhibit prepared from original drawings of record in the engineering department?

A. It was.

Q. Under your supervision?

A. That is correct.

[fol. 2103] Q. Is it a correct representation of those original records?

A. It is.

Mr. Mason: Have you any questions on the exhibit, Mr. Strouss?

Mr. Strouss: No questions.

Mr. Mason: I understand from the face of this exhibit, Mr. Kirkbride, it represents in cross-section the tie plates for various weights and types of rail which you referred to in your discussion of the preceding exhibits No. 157 and No. 158?

A. That is correct, old standards and present new standards.

Mr. Mason: We offer the exhibit in evidence as No. 159.

Mr. Strouss: No objection.

The Court: It may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 159.")

The Court: Before we leave the rails, there is one further question, Mr. Kirkbride; referring to exhibit No. 157.

I notice that you use the term "moment of inertia." What is the meaning of that term as applied to those rails?

A. In the scientific design of a rail a balanced condition and a distribution of metal exists as between the top called [fol. 2104] the "ball" and the base represented by the two flanges, the vertical member being the web. Now the strength of any metal of this shape is developed by the depth, the relative depth, between the top area and the bottom area and the areas of these top and bottom areas. To find out whether this rail is strong enough to support a weight between two fulcrums or points of support, the structural engineer goes into the mechanical features of that, known as "moments of inertia." Small minute areas are assumed at the top and bottom in relation to the neutral axis which is about midway between the top and bottom and a moment is set up, a mathematical moment is set up that unit times its distance, and then a summation of all those various units is made and the final answer is what is called the "moment of inertia." That is a rather rough description of the mathematics of the thing but it does enable the bridge designer, for instance, to determine the strength of a beam or girder, all of the factors being that you have a top flange and a bottom flange and a vertical flange and the greater the depth and the more the area the stronger the beam will be. Now a rail must be designed on the same principle as a bridge girder because it does serve [fol. 2105] such a purpose, spanning a gap from tie to tie, which is approximately 21 or in some cases 22 and 24 inches centers. I may further say that a rail is subject to other stresses, that is, to wear and tear on the ball and the outward thrust of the drivers of the locomotive. That is particularly true when you come to curves, the drivers bear on the outside of the curve, the outside rail, by reason of the operation of centrifugal force, and we try to overcome that by making the rails stiff and stable, hence the determination of a width of 5 or 6 inches.

The Court: Thank you.

Mr. Mason: Referring to exhibit No. 157, 158, and 159, do the standards which these exhibits portray apply to the tracks equally in Nevada and in Arizona?

A. They do.

Q. Do they conform generally to standards observed or set forth by the engineering committee of the Association of American Railroads?

A. They do.

Q. The maintenance of bridges comes under your jurisdiction as you stated?

A. That is correct.

Q. Have you any restrictions in the state of Arizona as [fol. 2106] to the weight of locomotives which may operate over any bridges in Arizona?

A. There are no restrictions due to bridges and trestles.

Q. Does that statement include the Colorado River bridge at Yuma?

A. That is a very modern bridge, that statement is correct.

Q. Is there any restriction from the standard of weight of locomotives which may be operated applicable to any main line bridges in the states of New Mexico or Texas on the Pacific lines?

A. No restrictions exist.

Q. Does that include the Rio Grande River bridges immediately west of El Paso?

A. It includes both bridges. I may say when we took over the E. P. & S. W. we had to rebuild or reinforce the bridge across the Rio Grande at El Paso in order to make it of sufficient strength to accommodate our locomotives.

Q. Suppose you wanted to run a train of AC class locomotives, four or five of them coupled in tandem, that is, immediately following each other with no cars between them, would you be able to run such a group of locomotives over the Colorado River bridge at Yuma?

[fol. 2107] A. We could so run the locomotives.

Q. Over the Rio Grande River bridges at El Paso?

A. That is correct.

Q. Would there be any bridges in the state of Arizona or New Mexico otherwise which would be restricted as to such a movement?

A. No such bridges.

Q. Does the same apply to trestles and culverts?

A. That is correct.

Q. Will you refer to the bridges in the states of Nevada and Utah and say whether your statements as to the adequacy of the bridges in Arizona and New Mexico apply alike there?

A. All bridges, trestles, and culverts are adequate to handle the power being operated or that is available for operation.

Q. Would you have any restriction against the operation of a succession of locomotives coupled together in Nevada or Utah?

A. No restriction.

Q. Have you with you a memorandum of the distribution of rail by weights in the state of Arizona?

A. I have.

[fol. 2108] Q. First I will ask you what is the total miles of main track in the state of Arizona as of the end of the year 1940 to which your memorandum relates?

A. There is 808.29 miles.

Q. In the state of Nevada have you a memorandum relating to the miles of track and weight of rail?

A. 819.82 miles including the Western Pacific Railroad paired track.

Q. The 819.82 figure which you have just recited is the main track mileage over which the Southern Pacific trains operate?

A. Yes, sir.

Q. Referring to the year 1912, what was the main track mileage of the Southern Pacific in Arizona as of June 30th?

A. 392.54 miles.

Q. Was there any of that laid with rail of greater weight than 90 pound?

A. No such weight of rail existed in the track.

Q. How much of it was laid with rail of 90 pound?

A. 100.55 miles.

Q. How much of it with rail of 85-pound weight?

A. 124.89 miles.

[fol. 2109] Q. Was that 85 or 80 pound?

A. That is 80. There was no 85-pound rail.

Q. 124.89 is 80 pound?

A. Yes.

Q. How much of it was there of 75 or 76 pound?

A. 167.45 miles.

Q. Was there any of it less than 75 pound?

A. .65 of a mile that was under 75-pound rail.

Q. Going to the year 1920, how many miles of main track were operated by the Southern Pacific in Arizona on December 31, 1920?

A. 399.95 miles.

Q. Was any of that laid with 110 or heavier weight of rail?

A. None of it was laid with such weight of rail.

Q. What was the heaviest weight of rail?

A. 90 pound.

Q. How much of the 90 pound?

A. 288.7 miles.

Q. Was there any 85 pound?

A. No. 85.

Q. How much 80 pound was there?

A. 105.8 miles.

Q. Was there any 75 or 76 pound?

A. 5.45 miles.

Q. Was there any of less weight than 75 pound?

[fol. 2110] A. None.

Q. In 1930 what was the total mileage of track operated by the company in Arizona?

A. 808.29 miles.

Q. How much of that was 130 or 131 pound?

A. 12 miles.

Q. How much was 110 or 112 pound?

A. 104.41 miles.

Q. How much was 90 pound?

A. 593.12 miles.

Q. How much was 85 pound?

A. 98.76 miles.

Q. Was there any of less weight than 85 pound?

A. No weight less than 85.

Q. In 1935 was the operated mileage the same as in 1930?

A. It was the same as 1930.

Q. How much 130-pound rail was in the track as of the end of 1935?

A. 36 miles.

Q. Of 110 and 112 pound?

A. 184.68 miles.

Q. Of 90 pound?

A. 507.32 miles.

Q. Of 85 pound?

A. 80.29 miles.

[fol. 2111] Q. Was there any lighter rail than 85 pound?

A. None.

Q. At the end of 1939 was the mileage the same?

A. The same.

Q. What was the mileage of 130 and 131-pound rail?

A. 57.17 miles.

Q. Of 110 and 112?

A. 273.55 miles.

Q. Of 90 pound?

A. 406.65 miles.

Q. Of 85 pound?

A. 70.92 miles.

Q. Was there any of lighter weight?

A. None.

Q. On December 31, 1940, have your the figures of rail by weights?

A. I have.

Q. What was the mileage of 130 and 131 pound?

A. 59 miles.

Q. And 110 and 112?

A. 305.43 miles.

Q. Of 90 pound?

A. 376.54 miles.

Q. Of 85 pound?

A. 67.31 miles.

[fol. 2112] Q. Was there any lighter weight rail?

A. None.

Q. You spoke previously I believe of the construction of the alternate main line through Phoenix as having taken place in 1924, 1925, and 1926. What weight of rail was used in constructing that line?

A. 90-pound section.

Q. Is that a relatively light traffic line from the stand point of gross tonnage?

A. It is.

Q. There is today as you have just stated 376.54 miles of 90-pound rail in the track in the state of Arizona. Where is the largest proportion of that 90-pound rail found?

A. 90-pound rail exrsts on the Phoenix line to which you have just referred continuously from Wellton through to Picacho except for a few curves. There is some 90-pound rail between Wellton and Dome and then there is 90-pound rail in stretches on the old line between Wellton, Gila, Phoenix, and Tucson. There is 90-pound rail in the track eastward from Tucson and in stretches continuing on to the state line, and dealing with the other line out of Tucson there is some 90-pound rail mixed up with the 85.

[fol. 2113] Q. You have referred to 85-pound rail previously, I think, as being on the line acquired from the E. P. & S. W. in 1924?

A. That is correct.

Q. Your figures show there was as of the end of 1940, 67.34 miles of 85-pound rail still in main line track in the state of Arizona?

A. That is correct.

Q. Where is that 85-pound rail found?

A. Taking the line out of Tucson and continuing on up to Mescal down to Fairbank and to Douglas and in certain stretches between Douglas eastward to the state line, 85-pound rail will be found.

The Court: Most of it is on the old E. P. & S. W. line?

A. I have just described that, it is all on the E. P. & S. W.

Mr. Mason: Is the E. P. & S. W. now called the south line through Douglas, a relatively light traffic line?

A. It is a relatively light traffic line.

Q. You spoke of some of this 85-pound rail on the line between Tucson and Mescal on the westward line, I believe?

A. It is due to the fact that the two lines within a few miles of Tucson are combined in there, practically speak-[fol. 2114] ing there is no 85-pound rail on the eastward track. It is all on the westward track.

Q. That is the downhill track?

A. The downhill track from Mescal to Tucson.

Q. You spoke of 90-pound rail, I think, in the track between Dome and Wellton. Is that double track?

A. Yes, sir.

Q. Does one of the two tracks of a double track receive less tonnage than a single track immediately adjacent to it?

A. I think the tonnage is about evenly divided between those two tracks.

Q. You mean eastward and westward tracks between Dome and Wellton?

A. Yes, sir.

The Court: We will take a short recess at this time.

(Thereupon a short recess was taken after which proceedings were resumed as follows.)

Mr. Mason: Mr. Kirkbride, earlier in your testimony you spoke of your duties as including the programming of vari-

ous maintenance projects to be conducted each calendar year including the programming of rail changes and rail renewal. Have you made up a program of rail renewal for [fol. 2115] Arizona for the year 1941?

A. We have.

Q. Will you state briefly what your program for this state contemplates?

A. Our program which is approved to commence the year with, looking forward to what we think we can do this year, is two hundred miles of new rail which is being purchased and that is distributed to the divisions in such a manner that we are going to lay 44 miles on the Tucson division, of which I think about 6 miles is just east of the state line, on the north line.

Q. The balance will all be in Arizona?

A. The balance will all be in Arizona.

Q. Have you any program of new rail for the Rio Grande division in Arizona?

A. There is some changing out of rail on the south line out of Tucson and extending to Douglas, the total being some 11 miles.

Q. What is to be the weight of the new rail placed in the track in Arizona according to your program?

A. The rail is to be of those sections shown as 113 pound and 132 pound head-free rails. Separating as between the weights of rail, there would be about 39 miles—now, re- [fol. 2116] ferring to the Tucson division—there would be about 39 miles of the 113 and 5 miles of the 132-pound section, all of the 132-pound section being laid on curves within the state of Arizona.

Q. If I got your figures correctly, of the 44 miles programmed for the Tucson division, 38 are within the state of Arizona, is that correct?

A. That is correct.

Q. And in addition, there are 11 miles on the Rio Grande division?

A. Yes, sir.

Q. Or a total of 49 miles programmed for 1941 for Arizona?

A. Yes, sir.

Q. Have you a memorandum as to the distribution of rails by weights and by years for the state of Nevada?

A. I have.

Q. Your figures for the state of Arizona are taken, are they not, from reports to the Arizona Corporation Commission supplemented by original records of your own office?

A. That is correct.

Q. And your figures for Nevada are taken from annual reports to the Public Service Commission of that state sup-
[fol. 2117] plemented by your own records?

A. That is correct.

Q. In the state of Nevada, take the end of the year 1920, what was the total miles of track operated in that state in that year?

A. 522.15.

Q. Was there any of that rail of greater weight than 90 pound?

A. None of it of greater weight than 90 pound.

Q. How much of it was of 90-pound weight?

A. 423.66 miles.

Q. How much of 85?

A. There was no 85-pound rail.

Q. How much of 80 pound?

A. 96.98 miles.

Q. Was there any 75 or 76-pound rail?

A. 1.51 miles.

Q. Any of lighter weight?

A. None.

Q. What was the total operated mileage in 1925?

A. 731.45 miles.

Q. Was any 130 or 131-pound in the track in 1925?

A. None.

Q. What was the mileage of 110 and 112 pound?

[fol. 2118] A. 16.05.

Q. Of 90 pound?

A. 507.75 miles.

Q. Of 85 pound?

A. 177.62 miles.

Q. Where was that 177.62 miles found?

A. On the Western Pacific paired track.

Q. How much 80 pound was there on December 31, 1925?

A. 28.81 miles.

Q. And the 75 pound?

A. 1.22 miles.

Q. In 1930 what was the total mileage of track?

A. 816.48.
Q. How much of that was 130 or 131 pound?
A. 25.45.
Q. How much was 110 and 112 pound?
A. 161.99 miles.
Q. And 90 pound?
A. 393.94 miles.
Q. And 85 pound?
A. 177.62 miles.
Q. And 80 pound?
A. .35 of a mile.
Q. And 75 and 76 pound?
A. 57.13 miles.
[fol. 2119] Q. Where was that 57.13 miles?
A. From Fernley extending to Alturas.
Q. Is that a line which formerly was a branch and was converted to main line in 1929?
A. It was.
Q. In 1935 what was the total of track mileage?
A. 816.38 miles.
Q. What was the mileage of 130 and 131 pound rail?
A. 55.94 miles.
Q. 110 and 112 pound?
A. 479.91 miles.
Q. 90 pound?
A. 190.96 miles.
Q. 85 pound?
A. 47.62 miles.
Q. 80 pound?
A. .35 of a mile.
Q. 75 and 76 pound?
A. 41.60 miles.
Q. What was the total mileage operated at the end of 1939?
A. 819.82 miles.
Q. And what was the mileage of 130 and 131-pound rail?
A. 77.38 miles.
[fol. 2120] Q. 110 and 112?
A. 642.19 miles.
Q. 90 pound?
A. 65.83 miles.
Q. Any 85 pound?

A. No.
Q. Any 80 pound?
A. .15 of a mile.
Q. 75 and 76 pound?
A. 34.27 miles.
Q. And the mileage as of the end of 1940?
A. 819.82 miles.
Q. 130 and 131-pound rail?
A. 78.47 miles.
Q. 110 and 112 pound?
A. 666.02 miles.
Q. 90 pound?
A. 41.90 miles.
Q. 85 pound?
A. None.
Q. 80 pound?
A. .15 of a mile.
Q. And 75 and 76 pound?
A. 33.28 miles.

[fol. 2121] Mr. Mason: Do I understand that all of the 75 and 76 is still on the Fernley-Modoc line?

A. That is correct.
Q. Is that a line of relatively light traffic?
A. Relatively light as compared to the main line.
Q. Any passenger operation over that line?
A. No passenger operation.
Q. You have stated, I believe, Mr. Kirkbride, that the standard of ballast on the Pacific Lines is eight inches, is that correct?
A. And twelve inches measured in depth under the ties to the sub-grade.
Q. Now, as of the present days, is there any track in the state of Arizona which is not fully ballasted?
A. None, dealing with the main line.
Q. That is what I am referring to, the main line. Is there any of the main operated track in the state of Nevada that is not fully ballasted?
A. None.
Q. What is the character of the ballast in use as of the end of 1940 in Arizona, giving that by districts, with particular reference to the Yuma-Gila-Lordsburg line?
A. There is in use in our lines in Arizona two types of [fol. 2122] ballast, namely, slag ballast from Douglas, some

of it coming from El Paso smelters, and the crushed granite rock from Dome.

Q. Now, the same line between Yuma and Lordsburg via Gila and Tucson was Southern Pacific property in 1912, as has been testified. Will you refer to the several sections of the line and state what the character of that ballast was in 1912, and what the character of the ballast is today?

A. All ballast was either gravel or none. When we say "none" we mean native material was substituted. For instance, Yuma to Wellton, there was gravel ballast.

Q. What is it today, Yuma to Wellton?

A. It is rock ballast.

Q. And the next section?

A. Wellton to Trigo, in 1912, none; now it is rock. Trigo to Enid, in 1912 was none, and now it is slag; Enid to Heaton was none in 1912, and now it is rock; Heaton to Jaynes in 1912 was gravel, now it is slag; Jaynes to Tucson in 1912 was none, now it is slag. Tucson to Vail, gravel in 1912, now slag. Vail to Chamiso, rock in 1912, slag now. Chamiso to State Line was rock, and it is now rock and slag.

[fol. 2123] Q. Have you increased the depth of the placement of ballast on the Arizona lines since 1912, or more particularly, since 1920?

A. We have very materially increased the amount of ballast by reason of the fact that our policy in connection with laying new rail is to surface the track up on new ballast approximately four inches in depth or more under the bottom of the tie, the existing ballast being used as a supporting ballast under the new ballast, and we commonly refer to it as sub-ballast; the combined depth of the accumulated ballast under the track in many cases approximating the depth of twelve inches below the bottom of the tie.

Q. Have you increased the standard of ballast in the state of Nevada since 1920?

A. We have.

Q. In the same manner as you have described in Arizona?

A. That is correct.

Q. Now, going to the matter of signals, have you a memorandum of the amount of track protected by automatic block signals in Arizona for several years past?

A. I have.

Q. Referring first to June 30, 1912, how much of the main [fol. 2124] track in Arizona was protected by automatic box signals in miles?

A. 291.27.

Q. How much was not protected?

A. 102.27.

Q. Now, in 1920, how much track was protected by automatic block signals?

A. 296.30.

Q. And how much wasn't protected?

A. 103.65.

Q. In 1925 what was protected?

A. 455.40.

Q. And not protected?

A. 121.04.

Q. What was the situation in 1930?

A. 799.30 miles protected, 8.99 miles not protected.

Q. Is the situation in 1940 and in the intervening years, the same as in 1930?

A. Identical.

Q. Where is this 8.99 miles of main track not protected?

A. Well, it is in the Tucson yard, 7.69 miles of it, being the old south line of the E. P. & S. W.

Q. That is still regarded for the purposes of this compu- [fol. 2125] tation as main line?

A. That is correct.

Q. Is it frequently used for the movement of trains?

A. It is not?

Q. And the balance is within the Tucson yard limits?

A. That is correct.

Q. Now, in the state of Nevada, in 1920, what was the mileage of main track protected by automatic block signals?

A. 521.85 miles.

Q. And how much not protected?

A. .30 of a mile.

Q. In 1930, what was the total mileage of the track protected by automatic block signals?

A. 748.81 miles.

Q. How much was not protected by signals?

A. 67.56 miles.

Q. Where is that mileage not protected by block signals found?

A. That is the line from Fernley on to Alturas.

Q. That is the portion of it in the state of Nevada, is it?

[fol. 2126] A. That is the portion of it in the state of Nevada.

Q. Now, in 1939, what was the total mileage of track in Nevada protected by block signals?

A. 752.5.

Q. Is the situation the same today?

A. It is the same.

Q. And not protected by block signals how much?

A. The same, 67.56.

Q. Is there a short mileage in Nevada protected by a so-called manual interlocker system?

A. .11 of a mile.

Q. How long has that prevailed?

A. That has prevailed since 1925.

Q. Are these block signals, automatic block signals in Arizona and Nevada wayside signals?

A. They are wayside signals.

Q. Generally the semaphore type?

A. Semaphore type.

Q. Is the color-light type of signal in use to any extent?

A. It is not.

Q. What type of ties are used in the main lines in Arizona?

A. We use creosoted fir, creosoted Texas pine, creosoted gum from Louisiana, creosoted spruce and fir from New [fol. 2127] Mexico, and a very small proportion of creosoted oak ties that come from Louisiana.

Q. Are there any portions of the main track in Arizona which are not predominantly laid with creosoted ties?

A. Very small part not laid with creosoted ties.

Q. Are there any stretches of track where creosoted ties are not found at all, or will the non-creosoted ties be found individually at intervals?

A. Our policy of tie renewals calls for the replacement of the tie, the individual tie as it requires replacement. Prior to the adoption of creosoting, we used zinc chloride treated ties, and there are probably a few of those in the tracks.

Q. Do you use the same class of creosoted ties in the state of Nevada?

A. The same class of treatment prevails over the System, there being this exception, that we use Oregon fir exclusively and Port Orford cedar ties for Oregon, the gum tie and the Texas pine not being available for that territory.

Q. Are all of the ties you use in Nevada as replacements at the present time creosoted ties?

A. They are all creosoted ties or Port Orford cedar ties. [fol. 2128] I may say, by way of explanation, that the Port Orford timber gives great resistance to decay, so that we classify it as similar in life to a creosoted tie.

Q. Do you use the same size of ties in the main lines in both states?

A. The same size.

Q. Is that general over the System?

A. It is general over the System, the same standard applies throughout the System.

Q. Is that in accordance with any standards or recommendations of the A.A.R. or its engineering committees?

A. Not specifically, although a seven by nine by eight foot tie is a common standard throughout the United States.

Q. How many ties per mile do you use in the main lines in Arizona?

A. We use 3,250 ties per mile.

The Court: How many was that?

A. 3,250 ties per mile.

Mr. Mason: Do you use any different standard of ties per mile in Nevada?

A. The same standard applies.

Q. Has there been any change in the standard of ties in [fol. 2129] Arizona as between 1912 or 1920 and the present day?

A. There has been a very material change in that the creosote tie has been adopted, and the size of tie previously ranged down to six by seven, and there were not so many ties used in the railroad, namely, we formerly used 2,880 per main-line track mile.

Q. Are the lines in Arizona laid with tie-plates under the rails?

A. They are all laid with tie-plates under the rail.

Q. Has that been true since 1912?

A. The railroad in 1912 was continuously tie-plated in Arizona.

Q. There has been, however, a change in the design of the tie-plate, as indicated on your exhibit No. 159, is that correct?

A. There is a very material change in the size and design of the tie-plate.

Q. Does that result in strengthening the tie-plate?

A. The tie-plate is much stronger and covers a greater area of space on the tie. For instance, the tie-plate formerly used along in 1912 was [illegible] square inches between and eight and three-quarters inches applied lengthwise with [fol. 2130] the tie, and our present plate is, for 110-112-pound rail, ten and seven-eighths inches long and occupying an area of 92.44 square inches, and the plate that goes under the 131 or 132-pound rail is eleven and three-eighths inches long, and is of such a width as to give 96.69 square inches of bearing area on the top. There has been a very material change in the design, which is due to the recommendations of the American Railway Engineering Association, and that is represented by the two flanges that are shown on the two bottom sections of Exhibit 159. This results in the rail resting within a pocket with a ridge of metal projecting against the flange on both sides of the rail. This offers additional strength against spreading of the rail under the impact or pressure of the flanges of the wheels; in other words, these projecting ridges of metal supplement the holding power of the spikes. The outer width is increased to three inches from the outer flange of the rail in order to prevent a tendency for the tie-plates to settle down into the tie and thus tip the rail over.

Q. Now, are the lines in Nevada continuously tie-plated?

A. They are.

[fol. 2131] Q. Have they been continuously tie-plated for several years past?

A. They have.

Q. Have they experienced the same changes in design of tie-plate which have taken place in Arizona?

A. The same change; the standards apply to all divisions.

Q. Will you say whether or not the climatic conditions in Arizona are relatively favorable or unfavorable to track maintenance?

A. They are favorable.

Q. Just what climatic conditions do you refer to in that regard?

A. The absence of heavy rainfall, creating a semi-arid condition, results in a dry, permeable soil, with which the roadbed is constructed. This results in a sub-grade strong, firm and solid, easily maintained and without undue or sudden settlement, which in turn would affect the surface of the track.

Q. Are the conditions of topography in Arizona relatively favorable or unfavorable?

A. They are favorable by reason of the long distances visibility being long and great, and only hills of moderate [fol. 2132] length or height, and without obstructing view due to forests or other obstructions incident to civilization, that is represented by a dense population, there being few grade crossings due to the scarcity of roads.

Q. Are the grade conditions in Arizona and New Mexico generally less severe or more severe than on other parts of the System?

Mr. Strouss: I object to that as calling for a conclusion.

Mr. Mason: This is merely a statement of mathematical facts within the witness's knowledge.

The Court: The objection is overruled.

A. They are less severe because the grades of the lines are not very steep, much flat level grade exists, whereas, elsewhere, on other parts of the System——

Mr. Strouss: Now, I would like to have this also, to know what parts of the System he is talking about.

The Court: Yes, be specific on that.

Mr. Mason: Where you speak of other parts of the System, where heavier grades exist, what parts do you speak of?

A. Elsewhere in California and Oregon, the height of the mountain grades, the river crossings that we traverse, [fol. 2133] makes it necessary to use steeper grades.

Q. Now, what is the ruling grade, for example, on the mountain crossing between Roseville and Sparks, eastward?

A. The compensated grade ascending eastward would be 2.47.

Q. 2.47?

A. Yes, sir.

Q. And what is the ruling grade for the crossing of the Tehachapi Mountain from Bakersfield southward?

A. That is a compensated grade of 2.5 per cent.

Q. What is the ruling grade crossing the Pass between Colton and Indio, the so-called Beaumont Hill?

A. Two per cent.

Q. Is that eastward as well as westward?

A. It is a 1.9 per cent eastward and two per cent westward.

Q. What is the ruling grade crossing the Santa Margarita Mountains between San Luis Obispo and Paso Robles?

A. 2.2 per cent.

Q. In both directions?

A. Yes, sir.

[fol. 2134] Q. What is the ruling grade across the Siskiyou Mountains in northern California and southern Oregon?

A. 3.3 per cent.

Q. Is that on the line between Black Butte and Ashland?

A. That is correct, the old line.

Q. What is it on the line via Klamath Falls and Crescent Lake?

A. We develop up the western slope of the Cascades on a .4 per cent, but on the easterly slope the ruling grade is 1.8 per cent.

Q. Is that 1.8 per cent opposed to traffic moving from San Francisco to Portland?

A. It is opposed to traffic moving southward from the Willamette Valley or from Portland.

Q. To Klamath Falls and San Francisco?

A. To Klamath Falls and San Francisco.

Q. Do you encounter any such grades as those you have mentioned on any main line in the State of Arizona?

A. We do not.

Q. Do you encounter any grades such as those in any part of the State of Nevada or Utah?

A. We do not.

Q. Will you say whether or not climatic conditions as [fol. 2135] they affect railroad maintenance and operation which prevail in Nevada and Utah resemble or differ from the conditions which prevail in Arizona?

A. They resemble.

Q. Is there any difference in the winter weather along our lines in Nevada as compared to the winter weather along our lines in Arizona?

A. The winter conditions are similar, except for the territory between Caslin and Montello, a distance of about 120 miles, where, particularly in the territory west of Wells, very low temperatures exist during the winter months, our thermometers having recorded temperatures below zero, ranging from 40 to 60 degrees.

Q. Do those periods of extremely cold weather prevail throughout the winter or only at intervals?

A. At intervals during the winter months only.

Q. Is Nevada generally a region of sparse rainfall, and having the other conditions of soil which you refer to as obtaining in Arizona?

A. It is.

Q. In referring to the grades on other portions of the System, I overlooked calling your attention to one other. [fol. 2136] Are you familiar with the grade at the upper end of the Sacramento Canyon from Dunsmuir up to Mount Shasta?

A. Yes, we use a 2.2 grade climbing out of Dunsmuir to the territory of Mott, then we flatten off into a 1.4 per cent.

Q. One other grade I want to ask you about, the grade on the western division between Niles, California and Tracy, California?

A. Altamont Hill is developed on a ruling grade of 1.3 per cent.

Q. Do the climatic and operating conditions which you have described in Arizona prevail likewise to a large extent on the company's lines in New Mexico?

A. That is correct.

Mr. Mason: I think that is all. Thank you. You may cross examine.

Mr. Strouss: I won't be able to release Mr. Kirkbride completely tonight, but I have some questions I want to ask.

Cross-examination.

By Mr. Strouss:

Q. When you were discussing earlier in the day defects in the rails, what did you mean by the term "defects," [fol. 2137] Mr. Kirkbride?

A. Well, rails in service develop weaknesses that result in actual breakage or removal from track because they are not considered suitable for further use. Now, there are various different kinds of defects.

Q. What I particularly want to know, were you using the term "defect" there with the meaning that flaws were in the rail which were caused in the making?

A. The source can be traced back to some imperfection in the manufacture in the rail.

Q. In other words, you are using the term "defect" as something that was wrong with the rail itself, not something that is, well, as contrasted to the wear of the rail?

A. Well, defects develop through wear. By way of illustration, you might have in the rolling of a rail, the hot metal having been taken off of the furnace, the open hearth furnace, and poured into an ingot, and then the ingot put in the soaking pit, and then finally put through the rolls, there might be certain imperfect practices, for instance, inclusions of slag might be in the rail, and that inclusion of slag would be in the rail when it is delivered to the [fol. 2138] company that purchased the rail. Now, there might be gas bubbles of hydrogen in the hot metal and in the soaking pits the rail wasn't given the opportunity to let the hot gases get out, and you would roll that rail and there would be a bubble that would be stretched out on the interior section of the rail, and it would take many years of service before that pipe, as we call it, due to this bubble of gas that is spread out in lamination, before it breaks. Of course, as I say, the original source of that defect was in the manufacture of the rail. Now, there might be various other defects in the rail.

Q. You are speaking, then, about defects in the manufacture of the rail, not the normal wear of a perfect rail?

A. I am not referring to the normal wear of a perfect rail.

Q. By the way, is the American Railway Engineering Association, is that a branch of the A.R.A.?

A. It is a branch.

Q. And when you refer to the A.R.A., that now is known as the A.A.R., is that correct?

A. That is correct. We still have the American Railway Engineering Association?

[fol. 2139] Q. But it is a branch now of the A.A.R.?

A. That is correct.

Q. Now, I believe you testified that as to Exhibits 155 and 156, that the condensing of the profile exaggerates, was it the vertical lines?

A. Well, it exaggerates the contour of the ground.

[fol. 2140] Mr. Strouss: If one map is drawn on a different scale than the other, the map with the smaller scale would be exaggerated more, would it not?

A. It depends on the relationship between your horizontal scale and the vertical scale.

Q. I believe you stated these were vertical scales that were shown on these exhibits?

A. I stated the vertical scale was illustrated by the horizontal lines marked 1000, 2000, 3000 or 4000.

Q. The scale on exhibits 155 and 156 seem to be different. That is, the scale on 155 seems to be a larger scale than on 156. I wondered why you used a different scale.

A. The original map is a master tracing and these are photostats. Obviously the scale will not be the same depending on the exact size the map was made.

Mr. Mason: I will say this for your information, Mr. Strouss, that Mr. Kirkbride may not have been familiar with the fact that we were trying to make these sheets all 11-1-2 inches wide and that is why one has been reduced a little more in the photograph than the others.

The Court: Because the originals were not the same [fol. 2141] size.

Mr. Mason: There is more information up and down on 156 than there is on 155. There had to be three drawings placed one above the other in order to show the profiles on 156 and only two on 155 and consequently there has been a little more squeezing on 156 in photography.

Mr. Strouss: That is what I was trying to develop, that 156 has been condensed more than 155.

Mr. Mason: The condensation naturally is simply that due to increase or decrease in size of photograph and squeezes the exhibit both ways, horizontally as well as vertically.

Mr. Strouss: That is true in both exhibits.

Mr. Mason: Yes.

Mr. Strouss: The Southern Pacific Company has the profile maps showing these,—I don't mean here in Tucson?

A. Yes, we have the profiles in San Francisco from which these condensed profiles are made.

Q. The Southern Pacific Company also maintains records with respect to curves on its line, does it not?

A. We do.

Q. Is that called a contour map?

[fol. 2142] A. No, the alignment of the track is shown in plan, including the right-of-way and land ownership and so forth by a right-of-way map upon which the alignment of the track is platted as well as the right-of-way that is known upon which the railroad is built.

Q. Does that show the curves and their location and degree of curve?

A. Yes, sir.

Q. Are there other records giving that same information?

A. Yes, there are various records.

Mr. Strouss: I would say to counsel I would like the profile records showing the ruling grades in both these territories and I want the record showing the curves and the location and the degrees of curvature in both territories.

Mr. Mason: Let me discuss with you off the record whether we will be able to satisfy your request and we will be able to say on the record whether we can.

Mr. Strouss: All right.

Q. You testified concerning the speed limits, both passenger and freight. Each division has special rules and special instructions governing speed in their territory, isn't that true?

[fol. 2143] A. That is correct.

Q. That is shown on the employes' timetables for the particular division?

A. Yes, sir.

Mr. Strouss: I understood from counsel that those timetables will be put in.

Mr. Booth: Yes, we will put in a complete set of timetables and either side may use them.

Mr. Mason: I think it is desirable to have the employes' timetables for the entire system part of the record and we will undertake to produce a sufficient number so they may be made an exhibit in the record. They have already been furnished to Mr. Strouss but I am not sure that those furnished are the latest editions as of this date. There have been some trains put on and perhaps some taken off since those were furnished.

The Court: Did I understand you to testify, Mr. Kirkbride, that with the exception of the mileage in the Tucson

yards the entire main line of the Southern Pacific was protected by block signals?

A. That is correct.

Mr. Mason: I take it your Honor has reference to the line in Arizona.

The Court: Yes.

[fol. 2144] Mr. Strouss: In your testimony a few minutes ago regarding the density of population did I understand you to testify that there is the same density of population along your main line in Nevada as in Arizona?

A. I didn't mean to say the same, but the situation as to population is very similar, the towns being far apart and rather few, so that there are long distances between stations without obstructions.

Q. As to grade crossings?

A. There are few grade crossings and both states are similar in that respect.

Q. What about the cities in Arizona? Are there comparable cities in Nevada?

A. The cities of Arizona are larger than in Nevada.

Q. And that results in more grade crossings?

A. Well, I wouldn't say that. For instance, the town of Reno while of less population than Phoenix or Tucson have a fearful lot of grade crossings; there is one grade crossing right after another.

Q. There are quite a few in Phoenix, aren't there?

A. Yes, that is true.

[fol. 2145] Q. And Tucson?

A. No, Tucson isn't so bad, and they have some subways in Tucson.

Q. They don't have any in Reno?

A. We have no subways in Reno—pardon me, I want to correct that. There are two subways in Reno, the outermost parts of Reno.

Q. Your maintenance crews have been reduced quite a bit over the last 15 or 20 years, haven't they?

A. No, I wouldn't say that.

Q. I am speaking about the number of crews now.

A. There has been some reduction in sections. Are you referring to section forces as pertaining to a section?

Q. That is right.

A. There has been some increase in the length of sections due to providing the section men with gasoline motor cars.

Q. So that your sections have been lengthened out and the number of section crews have been reduced?

A. Yes sir, but when we talk of track forces or section forces we include the extra gangs which now do the major part of the track work.

[fol. 2146] Q. Do you have your record of grade crossings for the two states?

Mr. Mason: We intend to put in an exhibit of the grade crossings of Arizona and Nevada.

Mr. Strouss: I think that is all the questions I have at the present time.

The Court: What is the mileage covered by one section crew now?

A. The average length of a section is ten miles; they will run up to 14 miles or they may be eight miles where curve conditions exist.

Mr. Mason: By that you mean track miles rather than road miles.

A. I mean track miles but not including sidings.

Mr. Mason: Do you have shorter sections in double track territory where there are two tracks to be maintained expressed in road miles?

A. Expressed in road miles it would be a shorter distance.

Mr. Strouss: The tonnage ratings of your locomotives are also shown in your employes' timetables for the particular divisions?

A. Yes, sir.

Mr. Strouss: After I have examined these records which I have referred to I may have some further questions. If [fol. 2147] Mr. Kirkbride is leaving I can look those records up and tell you after I have gone over them whether it will be necessary to bring him back.

Mr. Mason: We appreciate that very much, Mr. Strouss. Then you will not require him to return Tuesday morning, the 14th, for further cross-examination?

Mr. Strouss: No, I will want to examine the records which I will discuss with you after we have recessed before I will be prepared to cross-examine him further.

Mr. Mason: Will it be convenient for you to return at some other time, Mr. Kirkbride, if Mr. Strouss wants you to do so?

A. Yes.

(Discussion off the record.)

The Court: Then we will recess until Tuesday morning at ten o'clock.

(Thereupon at 4:00 p. m. January 9, 1941, the court stood at recess until 10:00 a. m. Tuesday, January 14, 1941.)

[fol. 2148] January 14, 1941, Ten o'clock A. M.

Proceedings were resumed at this time as follows:

The Court: You may proceed.

Mr. Mason: Before we proceed with any further testimony, Your Honor, I wanted to discuss with Mr. Strouss the matter of some stipulation with him which would cover the exhibits Nos. 11 and 12, which were offered when Mr. Porter of the New York Central was on the stand. In connection with other exhibits of this same kind, Mr. Strouss, there were certain questions you asked of the witness who presented them, and I am wondering if we couldn't have from you a statement of the questions that you would ask Mr. Porter if he were recalled, then we will obtain by correspondence with him the answers, and we can stipulate those answers in the record?

Mr. Strouss: Yes, I will be glad to do that.

Mr. Mason: Will you give the matter your consideration and tell me, perhaps today, what those questions will be, and I will air-mail Mr. Porter the questions and get the answers to them.

Mr. Strouss: I will do that this noon.

The Court: That is as to exhibits 11 and 12?

[fol. 2149] Mr. Mason: Yes, Exhibits 11 and 12. I will call Mr. Masson for further testimony.

L. J. Masson was recalled to the stand, and testified further as follows:

Direct Examination (Continued).

By Mr. Mason:

Q. Mr. Masson, I think that the last exhibit introduced by you was No. 151, Freight Operating and Freight Transportation Expenses Related to Traffic, Southern Pacific Company, Calendar years 1922 to 1939, Inclusive?

A. That is true.

Q. Have you that exhibit before you now?

A. Yes.

Q. Now, I wish you would refer, please to columns 4 and 6, particularly, of that exhibit, and state, if you will, explain your answer, whether the expenses which are included in freight transportation expenses, column 4, and which becomes the cost per thousand revenue ton-miles when carried into column 6, are affected by increases or reductions in train lengths.

[fol. 2150] Mr. Strouss: If the Court please, I object to that. The exhibits can speak for themselves, and it is plain here that this is made up of a number of items that the witness has testified to. If there is going to be testimony as to what the effect would be, I think the evidence should be as to what those items are and the changes in them.

The Court: Your objection is that it calls for a conclusion of the witness?

Mr. Strouss: Yes, calling for a conclusion.

The Court: I am inclined to sustain the objection, Mr. Mason. The objection is sustained.

Mr. Mason: Referring to freight transportation expenses, Mr. Masson, will you state whether or not wages of trainmen and enginemen are included in the items which go to make up those totals?

A. Yes.

Q. Now, will you state whether or not the item of the expenses of wages for trainmen and enginemen increases in proportion, or tends to increase in proportion to the number of trains operated?

Mr. Strouss: I object to that as calling for a conclusion. [fol. 2151] The facts might be testified to, but the conclusion to be drawn from those facts, is a matter for the Court. It is not a matter of expert testimony.

The Court: Yes, I will sustain the objection.

Mr. Mason: You are familiar, are you, Mr. Masson, with the fact that when a train is operated there must be trainmen and enginemen employed in connection with that operation?

A. Yes, sir.

Q. And do you know how many men are employed to operate a train of seventy freight cars in Arizona as members of the train and engine crews?

A. Two men on the engine, engineer and fireman, conductor and three brakemen.

Q. Now, if the train consists of sixty or seventy cars, are the same number of men employed?

A. Yes.

Q. If the train were to consist of a hundred cars, would the same number of men be employed?

A. Yes.

Q. If two trains are operated, do you employ twice as many men, or any additional men?

A. Naturally, we would have to have a crew for each train.

Q. Would you pay additional wages to the additional train crew for the second train?

[fol. 2152] Mr. Strouss: What is meant by "additional wages"; other than their regular wages?

Mr. Mason: Would the men employed on the second train be paid for their services?

A. Well, the boys don't work for nothing.

Q. Thus, by a series of what might be called second or first grade questions, we have established that the expense varies upward or downward in proportion to the number of trains operated; is that correct?

Mr. Strouss: I object to that as calling for a conclusion.

The Court: The objection is overruled.

A. The facts are these: as I said, the boys don't work for nothing. If we operate one train, we pay one crew's wages, the wages of one crew; if we operate two trains,

naturally we have to pay two crews. It naturally follows that the expense is greater for two trains, in wages than it is for one train.

[fol. 2153] Mr. Mason: Q. Now, Mr. Masson, suppose that we have at Yuma 490 cars to be moved over the Tucson division eastward. Under present restrictions what is the minimum number of trains in which those cars could be moved?

A. That would take seven trains of 70 cars each, 490 cars.

Q. Suppose that the Train Limit Law being absent, it were practicable to move in units of, let's say, 100 cars, how many trains would be required?

A. I should say four trains of 100 cars each and one train of 90 cars.

Q. So in one instance there would be seven trains and in the other not more than five, is that correct?

A. That is true. Now, of course, dispatchers might work those cars into fewer trains, four trains possibly.

Q. Will you say whether or not a train limitation such as a 70-car law has the effect of increasing or reducing the number of trains required to handle a given amount of traffic?

Mr. Strouss: I object to that question as calling for a conclusion.

The Court: Objection overruled, it is very evident what [fol. 2154] the answer will be.

Mr. Strouss: It is not a matter of expert testimony.

Mr. Mason: Isn't a matter of mathematics well within the comprehension of the assistant general auditor? Even an ordinary attorney may figure that one.

The Court: He may answer.

A. Possibly I could answer that with some figures. Let's take 1939, for instance.

Mr. Mason: First of all I would like to have the question answered specifically. Will you read the question, please.

(The question was read by the reporter as follows: "Will you say whether or not a train limitation such as a 70-car law has the effect of increasing or reducing the number of trains required to handle a given amount of traffic?")

A. Where a given amount of traffic expressed in ton-miles or car-miles is to be moved, the number of trains re-

quired to handle it will increase if the trains are shortened. In other words, as longer trains are operated; fewer of them will be required to handle the same quantity of traffic.

Q. I think you have stated when additional trains are operated additional wages are paid. If fewer and longer [fol. 2155] trains are operated, will the wage expense for train and engine service employees tend to increase or reduce, assuming that the volume of traffic remains constant?

A. Over all the fewer, the number of trains the less wages we will have to pay.

Q. Then if for a constant volume of traffic you pay less wages, can you make a similar computation as to the wage cost per unit of traffic handled, contrasting long-train and short-train operations?

A. The longer the train, the lesser will be the unit cost.

Q. Speaking of wages?

A. Yes.

Q. Where longer trains are operated and fewer of them, will you require more or fewer locomotives for the operation?

A. Longer trains would require of course fewer locomotives, assuming that heavier power will be used.

Q. Do costs of locomotive operations such as fuel and supplies enter into the accounts which form the group making up freight transportation expenses?

A. Yes.

Q. In the operation of fewer locomotives in the manner that you have indicated, would the costs of locomotive fuel [fol. 2156] and supplies tend to increase or to decline?

A. It would decline.

Mr. Strouss: May I have my objection go to the competency of this?

The Court: Yes.

Mr. Mason: What effect, if any, would that tendency to decline have upon the unit cost of freight transportation expense applied to a unit of traffic?

A. The more units of traffic that you can handle in a train the lesser will be your unit cost.

Q. Have you before you a statement in one sheet bearing title, "Southern Pacific Company, Freight Operating and Freight Transportation Expenses Related to Traffic, State of Arizona, Calendar Years 1922 to 1939, Inclusive"?

A. Yes.

Mr. Mason: We ask that this statement be marked No. 160 for identification.

The Court: It may be marked.

The Clerk: Defendant's exhibit No. 160 for identification.

Mr. Mason: This statement appears to be similar in form to exhibit No. 151, Mr. Masson, is that correct?

[fol. 2157] A. Yes.

Q. And relates entirely to the state of Arizona?

A. Yes.

Q. Did you have this statement prepared under your direction?

A. Yes.

Q. From what sources?

A. As shown at the bottom of the exhibit, it is taken from schedules 931 and 720 or corresponding schedules of annual reports to the Corporation Commission of the state of Arizona.

Q. Are the computations in columns 5 and 6 and those in the blocks at the foot of the sheet made from the other figures appearing in columns 2, 3, and 4?

A. Yes.

Q. Will you state whether or not the explanation previously made in connection with exhibit No. 151 applies also to exhibit No. 160 for identification?

A. Yes.

Q. Has the exhibit been compared and checked against the original sources?

A. The exhibit has been prepared under my supervision [fol. 2158] and direction, and I spot-checked it and it is correct to the best of my knowledge and belief.

Q. I think you stated previously that any reports to the Corporation Commission of the state of Arizona were available?

A. Yes, they are available.

Mr. Mason: I believe, Mr. Strouss, that you have them from another source anyway?

Mr. Strouss: I don't have them here, they are on file with the Corporation Commission.

The Witness: We have them here.

Mr. Strouss: Mr. Masson has told me that.

Mr. Mason: Have you any questions on No. 160, Mr. Strouss?

Mr. Strouss: Yes. This includes both interstate and intrastate expense, doesn't it?

A. It includes the expense of handling all traffic within the state of Arizona.

Mr. Strouss: Interstate and intrastate?

A. Yes.

Mr. Strouss: Is there any formula used in connection with the apportionment of the expense on interstate?

A. To the state of Arizona?

Mr. Strouss: Yes.

[fol. 2159] A. Yes, as prescribed by the Corporation Commission of the State of Arizona.

Mr. Strouss: And the amounts shown here are in accordance with that formula?

A. Yes, the amounts shown there represent freight expense directly assignable to the state or the freight proportion of interstate expense allocated to the state in accordance with this formula.

Mr. Strouss: I have no objection to the exhibit.

Mr. Mason: We offer it in evidence as No. 160.

Mr. Strouss: This covers all expense, branch lines as well as main lines, doesn't it?

A. Yes.

The Court: It may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 160").

[fol. 2160] Mr. Mason: In connection with Exhibit 160, Mr. Mason, will you please refer to Exhibit 149?

A. Yes, sir, 149. Do you refer to Exhibit 160?

Q. I want you to look at 160 and 149 together. As I understand it, Exhibit 149 shows the results of freight train operation in the State of Arizona and, as you have explained, shows the average cars per train in column 4?

A. Yes.

Q. Now, will you look at the years 1922 to 1925, inclusive, in column 4 of 149? Can you compute, readily, the average cars per train during that four-year period? Well, if the computation has not been made, I will pass the subject matter for the moment.

A. No, the computation has not been made.

Q. And ask you to make the computation at the first recess, then we will return to it. Are there any figures on 160 which can be compared with figures on Exhibit 151 for the System?

A. The material comparisons are found in the lower part of the exhibits, where the exhibit 160 shows that in Arizona, there was a reduction in the cost per thousand revenue [fol. 2161] ton-miles of total of freight operating expenses of nineteen and a half per cent.

Q. That is the last figure in Column 5 of Exhibit 160?

A. Yes. Now, the corresponding figure in Column 5 of Exhibit 151 shows that there was a decrease in freight operating expenses on the System of 28.1 per cent.

Q. That is the comparison of the first full four-year period shown on each exhibit with the last full four-year period shown on each exhibit, isn't it?

A. Yes.

Q. Will you also refer to the figures in column 6, and especially of percentage of improvements?

A. In Arizona, exhibit 160 shows, in column 6, a reduction in freight transportation expenses of 6.8 per cent as against a reduction on the System of 21.5 per cent, which is shown in column 6 of Exhibit 151.

Mr. Mason: Have you any questions, Mr. Strouss, before we pass to another exhibit?

Mr. Strouss: No; I think I prefer to wait until you have completed your examination. I will have to go back and [fol. 2162] piece this together when he is finished.

Mr. Mason: Have you before you, Mr. Masson, a statement in one sheet entitled "Southern Pacific Company——"?

The Court: (Interrupting) Oh, Mr. Mason, before you go on with that, the Court does have one question.

Q. Now, I notice by reference to Exhibit 160, as you have just pointed out in your testimony, that the percent of improvements over the entire system, or at least the Pacific Lines, was far greater, that is in the last line; the fifth and sixth columns, than it was in the State of Arizona, and yet,

I find difficulty in reconciling that with the fact that, taking your totals for the years 1936 to 1939, the freight operating expense for the entire system, averaged per one thousand revenue ton-miles apparently $7.15, whereas, within the state of Arizona, it was only $5.97. Isn't that a lesser cost of operation?

A. It is a lesser cost, but the degree of reduction is more on the System than it is in Arizona. The unit cost, it is true, is less. But when we compare the unit cost in the first block, 1922 to 1925, with 1936-1939, we find that rela- [fol. 2163] tively the costs have reduced to a greater extent on the System.

Q. And yet, Mr. Masson, in the first four years of this period, 1922 to 1925, the operating cost or expense for the entire system was $9.94 as against $7.42 for the State of Arizona?

A. That is true.

Q. I find a little difficulty in my own mind in reconciling these figures with the figures in the two columns above?

A. Possibly we look at it in a different way. You are looking at it as to the unit cost. We concede that the unit costs in Arizona, according to these figures, are lower than the System's. However, comparing the two periods, while the cost in Arizona is lower, the progress downward was at a less rapid pace than on the System as a whole.

Q. In other words, you are making more substantial reductions in your cost of operations on the System as a whole?

A. Yes.

Q. On a percentage basis than you were in the State of Arizona?

A. Yes; that is the intent of this exhibit, that is what this exhibit intends to show, the pace or the rapidity of the [fol. 2164] decline was greater on the System, expressed percentage-wise, than it was in Arizona.

Q. Well, even conceding that to be true, as shown by your exhibits, how do you account for the fact, in light of your previous testimony here this morning, that it costs more to operate the short trains, proportionately, than it does if you were to operate long trains, I say, how do you account for the fact that the operating cost in the state of Arizona is less than over the entire system?

A. That is because the entire system takes up all of its operations, long trains, short trains, main line and branches.

Now, the System as a whole, has many branches, which, of course are not affected by the long or the short train operations.

Q. By the way, Mr. Masson, let me interrupt there. I notice your exhibit 151 refers to Pacific Lines?

A. Yes.

Q. Does that include the entire System?

A. Yes.

Q. So, when you say, "Pacific Lines," you really mean the Southern Pacific Railroad Company, in its [fol. 2165] entirety?

A. In its entirety? I don't mean that, no, sir. The Southern Pacific Company owns and operates the lines from——

The Court: Well, shown here on Exhibit 151.

The Witness: Yes. Besides that, it operates the Atlantic Steamship Lines, that is the Southern Pacific Company. When we speak of the Pacific Lines of the Southern Pacific Company, we mean the lines that are on the map there.

The Court: The railroad?

A. Yes.

Mr. Mason: It doesn't include the lines east of El Paso, Texas?

A. No, it doesn't. The lines east of El Paso, Texas, are operated by the Texas and New Orleans Railroad. That railroad is wholly owned by the Southern Pacific Company, but it is separately operated.

The Court: But the statistics of operation are included in your Exhibit 151?

A. No, sir; later on in my testimony. I will have an exhibit that will show the net income of the transportation system. We know, or we term the lines, that are the map, the Pacific Lines of the Southern Pacific Company. The [fol. 2166] lines that are on the map plus the lines east of El Paso, and the Atlantic Steamship Lines are known by us as the transportation system of the Southern Pacific Company.

The Court: I see.

The Witness: (Continuing) So the exhibits that we are submitting here headed, "Pacific Lines," deal only with the lines that are on the map.

The Court: But that does not include the line from El Paso to Tucumcari?

A. Oh, yes, I overlooked that when I said east of El Paso. It includes the lines from El Paso to Tucumcari as part of the Pacific Lines.

The Court: All right.

Mr. Strouss: I didn't mean to say that I wouldn't eventually have some questions of this witness.

The Court: I understand that, Mr. Strouss.

Mr. Mason: I understand. I said, at this time.

Mr. Strouss: I have a number of questions on the exhibit, but I want to see what further exhibits are put in. There may be an exhibit as to operating ratios.

The Court: You may proceed.

[fol. 2167] Mr. Mason: Mr. Masson, were you present in the courtroom when Mr. Kirkbride testified as to the operating conditions in Arizona and Nevada, and to some extent as to those in California and Oregon?

A. Yes, sir.

Q. These absolute unit cost figures, getting away for a moment from the improvement percentages, for Arizona as compared to the System as a whole to some extent would be affected by the operating conditions in Arizona if they are more favorable than those which prevail in other parts of the System, would they not?

A. Naturally.

The Court: Will you read that question and answer?

(The last question and answer were read by the reporter.)

Mr. Mason: Now, in order to complete the picture, Mr. Masson, will you turn to your next exhibit, "freight operating and freight transportation expenses related to traffic, State of Nevada," have you that before you?

A. Yes.

Mr. Mason: May we have that statement in one sheet marked "Defendant's Exhibit 161?"

[fol. 2168] The Court: It may be marked.

The Clerk: Defendant's Exhibit 161 for identification.

Mr. Mason: Will you state, Mr. Masson, whether Exhibit 161 for identification resembles No. 160 and also 151?

A. Yes.

Q. But relates entirely to the State of Nevada?

A. Yes.

Q. What is the source of the figures?

A. Taken from the annual report to the Public Service Commission of the State of Nevada, that is, columns 2, 3 and 4, are taken from that source.

Q. And the computations are otherwise your own computations?

A. Yes.

Q. And you have undertaken to show percentages of improvement by four-year periods, comparing the first four years with the last four years?

A. Yes.

Q. Are the figures for freight operating and freight transportation expenses for traffic handled in Nevada allocated to that state in accordance with a formula prescribed [fol. 2169] by the Public Service Commission?

A. They are allocated to the state in accordance with a formula adopted by the National Association of Railway Commissioners.

Q. National Association of Railway Commissioners?

A. Yes.

Q. Is the same formula followed in both Arizona and Nevada?

A. No.

[fol. 2170] Mr. Mason:—What is the difference, if any, between the formula used in allocating the expenses to the state of Arizona and that used in allocating expenses to the state of Nevada?

A. Read that question back, please.

(The question was read by the reporter.)

A. The difference is this, that expenses allocated to Nevada are on a straight relative train-mile basis, whereas the expenses allocated to Arizona are on the basis of the formulae prescribed by the Arizona commission.

Q. Does the formula prescribed by the Arizona commission take into account other matters besides the train-mile basis?

A. It does, various accounts are split on different bases.

Q. Are any of them allocated on the train-mile basis?

A. I don't find that any of them are.

Q. Are any of these expenses directly allocated to the states in which they are incurred instead of being apportioned?

A. In Arizona, yes; Nevada, no.

The Court: Mr. Masson, these two exhibits which are identical as to form, I refer to No. 160 and No. 161, which purport to show the status of matters in the states of [fol. 2171] Arizona and Nevada, are the figures shown in columns 5 and 6 for those two states comparable?

A. As to the manner of composition, no.

The Court: That is by reason of the fact that a different formula or basis is used for the preparation of these reports in accordance with the laws of the state of Nevada and the laws of the state of Arizona?

A. Yes.

Mr. Mason: Has the same method of allocating the expenses to the state of Arizona been in effect throughout the period 1922 to 1939 shown on exhibit No. 160?

A. Yes.

Q. Has the same method of allocating the expenses to the state of Nevada been in effect throughout the period shown on exhibit No. 161 for identification?

A. Yes.

Q. Will you say whether or not the exhibits correctly indicate the trends of expenses over the period indicated, disregarding for the moment any attempt to compare absolute costs?

A. In my opinion they do.

Q. Do they indicate the trends of expenses, actual and [fol. 2172] average expenses, in the same manner as No. 151?

A. Yes.

The Court: In exhibit No. 151, which covers your entire system, are the figures shown there more comparable with the Arizona setup or with the Nevada setup?

A. They are more comparable with the Nevada setup.

Mr. Mason: Are these figures on exhibit No. 151 the actual figures without allocation of the entire system?

A. Those are the actual figures for the entire system.

Q. Those are not allocated or apportioned?
A. As between services only.
Q. But not as between territories?
A. No.
Q. These figures on exhibit No. 161 are apportioned as between Nevada and the balance of the system, are they?
A. Yes.
Q. These represent the Nevada apportionment?
A. Yes.
Q. As reported and as required to be reported to the Public Service Commission of that state?
[fol. 2173] A. Yes.
Q. Is this a correct transcription of the figures appearing in the reports to the Public Service Commission?
A. Those figures were taken from the reports to the commission, were spot-checked by me, and I believe them to be correct.
Q. And the computations were made under your direction, were they?
A. Yes.
Q. Have you the reports to the Nevada commission for the period of years covered by exhibit No. 161?
A. We have them here. They are in use now, but we will have them available for Mr. Strouss at the close of my testimony?

The Court: Just one more question. I notice by reference to exhibit No. 151 those figures are taken from the reports made to the Interstate Commerce Commission. I take it that Arizona is the one that is out of step in its accounting system rather than Nevada?
A. I wouldn't say that Arizona is out of step, Your Honor, that is the method they require. We have besides Arizona a different basis yet for Oregon, so that each state according to its disposition and outlook has required the [fol. 2174] allocation of expenses to their respective states according as they saw fit. Arizona prescribed this formula; Oregon has another formula; Utah, New Mexico, California, Nevada, all use the formula prescribed by the National Association of Railway Commissioners.

Mr. Mason: Irrespective of the differences in formulae, will you say whether or not the figures as reported to the several commissions of Arizona or Nevada or to the Inter-

state Commerce Commission will reflect increases or reductions in expenses of operation as they occur?

A. Yes.

Q. Will they accurately reflect the trends of operating expenses either upward or downward as those trends are revealed in actual money spent?

A. Yes.

Mr. Mason: Have you any questions on exhibit No. 161, Mr. Strouss?

Mr. Strouss: Yes, I have. Mr. Masson, the same basis of wage scales is not in effect in Nevada and Arizona as far as train crews are concerned. In other words, your enginemen are paid on the basis of so-called "mountain territory" and "plain territory"?

[fol. 2175] Mr. Mason: Paid on the basis of weight on drivers in both states.

Mr. Strouss: One uses the mountain territory as a basis and the other is on the basis of plain territory, isn't that true?

A. The basic rate is the same but our enginemen are paid according to the weight on drivers. Naturally where we have heavy power the engineman will get a higher rate of pay than the man who is running a smaller engine.

Mr. Strouss: You have a differential in wages according to whether it is so-called "mountain territory" or "plain territory"?

A. Yes.

Mr. Mason: I didn't qualify the witness in respect to that and I don't know that this is proper cross-examination in any event. The agreements with the train and engine service employees contain rates for the districts and divisions as shown on Mr. Kirkbride's exhibit, showing the divisions by boundaries and would unquestionably be the best evidence, if you have a copy, that is, brought down to date. As a matter of fact I am sure there is no mountain differential on enginemen, that is based entirely on weight on drivers. You may be correct as to trainmen.

[fol. 2176] Mr. Strouss: I am asking this to lay the basis for an objection that this is not proper. Cost of helper service is an item that enters into transportation and operating expense, isn't that true?

A. Yes.

Mr. Strouss: It is a fact on the Salt Lake division your helper service there is something over one hundred thousand locomotive-miles in excess of that in Arizona, or was for the year 1939?

A. In what territory?

Mr. Strouss: Salt Lake division, in excess of that in Arizona.

Mr. Mason: Is that a matter that is now in evidence?

Mr. Strouss: I don't think it is in evidence, I am seeking the information.

Mr. Mason: It is based upon an assumption of fact not in evidence.

Mr. Strouss: I am taking the information from the records given to me. I am asking if it is a fact as shown by the record of the company as a basis for determining whether there is a comparison between the two divisions.

Mr. Mason: I think that is improper cross-examination. I think that if that is a fact it should be brought out in the State's affirmative case. I don't think there is any such [fol. 2177] fact in evidence now.

The Court: I believe that is true.

Mr. Strouss: This is offered as a comparison between the two divisions, whether they are comparable or not.

Mr. Mason: Isn't that a method of affirmative attack on the part of the State to show that the comparison, such as it is, has certain deficiencies?

The Court: No, I will overrule the objection. However, we are not going into great detail on this or into contracts which are not in evidence. We will take our morning recess at this time.

(Thereupon a short recess was taken after which proceedings were resumed as follows.)

Mr. Mason: I think there was an unanswered question pending.

The Court: Yes. You may proceed, Mr. Strouss.

The Witness: That question was what?

(The question was read by the reporter as follows: "It is a fact on the Salt Lake division your helper service there is something over one hundred thousand locomotive-miles in excess of that in Arizona, or was for the year 1939?")

A. Are you speaking of state of Arizona or Salt Lake division against Tucson division?

[fol. 2178] Mr. Strouss: Against the Tucson division.

Mr. Mason: I suggest without undertaking to renew the objection to the question if the question relates to the Salt Lake and Tucson divisions it doesn't exactly address itself to exhibit No. 161 for identification, which relates to the state of Nevada, and its companion exhibit, No. 160, relates to the state of Arizona. The Salt Lake division includes mileage outside the state of Nevada and does not include all the mileage within that state, although nearly all of it, but it includes mileage in Utah and California as well. The Tucson division does not include all the mileage in Arizona, as Your Honor will recall from Mr. Kirkbride's exhibit No. 154.

The Court: As to the question relating to a comparison between the divisions, the objection will be sustained.

[fol. 2179] Mr. Strouss: Well, can you limit that to the two states? As to the two states, Nevada and Arizona, the helper cost for the year 1939 was substantially in excess of that in Nevada, wasn't it?

A. Will you pardon me just a moment until I get my books. Arizona, for the year 1939, had 201,311 helper locomotive-miles; Nevada had 70,678 helper locomotive-miles in freight service. That would indicate that the helper miles were greater in Arizona than they were in Nevada.

Q. Now, referring to yard switching freight service, the locomotive-miles in yard switching freight service was substantially greater in Arizona than in Nevada for the year 1939?

A. Did you say substantially greater in Nevada?

Q. In Arizona, freight service.

A. Arizona had 419,662 yard switching locomotive-miles in freight service, and Nevada had 146,196.

Q. That is an item that enters into both transportation and operation expense?

A. Yes.

Mr. Strouss: Those are the only questions I have.

[fol. 2180] Mr. Mason: What were the total locomotive miles in Arizona and Nevada in the year 1939?

A. Total locomotive miles in freight service in Arizona was 3,644,355; in Nevada it was 2,214,295.

Q. Where more trains are run, Mr. Masson, it is necessary to run more locomotive-miles, isn't it?

A. Why, yes.

Mr. Strouss: Are all these figures main-line or main-line and branch?

A. This is main line and branch.

Q. The last or all of them?

A. What is that?

Q. The last figures, the total locomotive miles, that is main-line and branch.

A. Yes, sir.

Q. Now, the figures given as to helper locomotive miles, main line only, wasn't it?

A. That is main line and branch, if we have any helper on the branch. In other words, those figures I quoted, come from Schedule 931 of the Annual Reports, which comprehends locomotives in all services on main line and branches.

Mr. Mason: And what about yard switching, is that main line only, or main line and branch?

[fol. 2181] A. That is wherever it happens to be. In other words, these figures I gave you are the totals within the state on any lines that are operated.

Q. These figures on 161, are likewise figures for the State, whether main or branch lines?

A. Yes.

Q. Is the same true of 160?

A. Yes.

Q. And 151?

A. Yes.

Q. I don't know whether I asked you, Mr. Masson, but, in any event, I will ask you again, is the Exhibit 161 for identification true and correct in so far as it reproduces the underlying source?

A. It is.

Q. And true and correct in so far as the computations are made?

A. It is to the best of my knowledge and belief.

Mr. Mason: We offer the exhibit in evidence as Defendant's Exhibit 161.

Mr. Strouss: Objected to as irrelevant and immaterial, and incompetent.

The Court: The objection is overruled. It may be ad-
[fol. 2182] mitted.

(The document referred to was received in evidence and marked "Defendant Exhibit No. 161.")

Mr. Mason: Now, are there any figures on Exhibit 161, Mr. Masson, to which you wish to direct attention, having in mind the preceding exhibits numbers 151 and 160?

A. Yes; the figures which represents the progress made in reducing expenses contained in the last line on Exhibit 161 entitled "Percent of Improvement, four years, 1936 to 1939, Compared with four years 1922 to 1925," shows that in the State of Nevada there was 30.7 per cent reduction in the average freight operating expenses per thousand revenue ton-miles. That is shown in column 5 of Exhibit 161. In column 6, the last figure therein, of Exhibit 161, shows that there was a reduction in the average freight transportation expenses per thousand revenue ton-miles of 24.4 per cent. That, by the way, is a much better showing than for the System.

Q. Has the basis of reporting and allocating the expense to Nevada been the same throughout the period shown in this exhibit?

A. Yes.

[fol. 2183] Q. Are the figures for the four-year period 1922 to 1925, inclusive, in the line which is shown for those figures, comparable from that standpoint to those for the last four years?

A. Yes.

Q. You were asked to refer to exhibit 149, and to compute the average cars per train for the four-year period 1922 to 1925, inclusive, for Arizona. Have you made that computation?

A. Yes. I developed a figure of 54.4 cars per train.

Q. Now, have you made the computation of the average cars per train for the years 1936 to 1939 for Arizona from the same exhibit?

A. I have not.

Mr. Mason: Well, we will defer that computation until two o'clock, and when you make it, I wish you would also make a computation of the average cars per train for Nevada for the four years 1922 to 1925, inclusive, and the four years 1936 to 1939, inclusive, from Exhibit 150.

(Addresssing Mr. Strouss:) Before we pass to the next exhibit, Mr. Strouss, I have in the courtroom here for the purpose of furnishing to you, in compliance with your request made at the conclusion of Mr. Kirkbride's testimony, [fol. 2184] the profiles of our main line in Arizona from the California-Arizona state line to the Arizona-New Mexico state line, including the line via Phoenix, and the south line via Douglas, main lines only, and likewise from the California-Nevada state line to the Nevada-Utah state line, both the so-called principal main line via Sparks, Imlay, Carlin and so forth, and the auxiliary main line from Fernley to the Nevada-California state line in the direction of Wendel and Alturas. Now, I understand these profiles include the information as to grades, as well as curvatures, which you wish to have. They are in the boxes in the rear of the inclosure here and will be available to you.

Q. Mr. Masson, have you before you a statement in one sheet entitled, "Southern Pacific Company, Freight Service, Operating Averages, Calendar Years 1922," and then alternate years to 1938, and including 1939?

A. Yes.

Q. Being in one sheet?

A. Yes.

Mr. Mason: We ask that this exhibit be marked No. 162 for identification.

The Court: It may be marked.

[fol. 2185] The Clerk: Defendant's Exhibit No. 162 for identification.

Mr. Mason: Did you cause Exhibit 162 for identification to be prepared, Mr. Masson?

A. Yes.

Q. Are the sources of the exhibit as shown in the footnotes thereon?

A. Yes.

Q. And do you recall Dr. Parmalee's exhibit No. 22?

A. Yes.

Q. I will ask you whether exhibit 162 for identification is similar to Dr. Parmalee's exhibit No. 22, the difference being that this exhibit relates to the Pacific lines of the Southern Pacific Company, whereas, the exhibit of Dr. Parmalee relates to Class 1 railroads of the United States?

A. It is the same as Dr. Parmalee's exhibit, except that

this exhibit 162 applies or deals with data pertaining exclusively to the Southern Pacific Company Pacific Lines.

Q. Now, Line No. 1, or Item No. 1 of exhibit 162 relates to miles of road operated in freight service. Will you state whether that includes only main lines or all main and branch lines?

[fol. 2186] A. Main and branch lines.

Q. What do the figures in Item 2, freight train-miles relate to, from the same standpoint?

A. All freight train-miles made on main and branch lines over the entire system.

Q. Are those figures contained in the OS-A reports in exactly the same form as they appear here?

A. Yes.

Q. What as to Item 3?

A. Item 3 appears in the OS-A report.

Q. Likewise Item 4?

A. Item 4, yes.

Q. Does Item 3 include only loaded cars or all cars both loaded and empty?

A. Loaded and empty.

Q. When you speak of net tons per freight train, as shown in Item 4, does that include any of the weight of equipment?

A. No, it only includes the contents of the traffic, the contents of the cars I should say.

Q. Does it include non-revenue as well as revenue freight?

A. Yes.

Q. Now, Item No. 5, is that a calculated figure?

[fol. 2187] A. Yes, that is based on data that is shown in the Annual Report to the Interstate Commerce Commission.

Q. It is a quotient as indicated in the note bearing the reference to Item 5?

A. Yes.

Q. And obtained from what figures appearing in the underlying source?

A. It is the total tractive effort that appears in Schedule 417, Column X, page 405, using 1939 as an illustration, divided by the total number of locomotives available for service at the close of the year.

Q. And is Item 6 a similar quotient calculated by division of items appearing in the annual report?

A. Item 6 is a figure that is reported in the annual report to the Interstate Commerce Commission in Schedule 417,

being on line 26 of the Annual Report for 1939, using that year as an illustration, page 406, except that we have in preparing this exhibit dropped one place in the decimal, raising the figure "five" to "six"; in other words, the figure in the annual report reads 47.55 whereas the figure in 1939 of the exhibit reads 47.6.

Q. In general, in this item number 6 you have reduced [fol. 2188] the decimal places to one and taken the nearest whole tenth, is that correct?

A. Yes.

Q. Now, these other figures, Items 7 and 8, are figures reported to the Commission, are they?

A. On Form OS-A, yes.

Q. And Item 9, is that a calculated figure?

A. Item 9 is a calculated figure, yes.

Q. The net ton-miles and the train-hours being reported on the form?

A. The net ton-miles, the basic figures are shown on Form OS-A.

Q. What about Item 10?

A. The basic figures are shown on Form OS-A, from 1922 to 1934, then the gross ton-miles, cars, contents and cabooses are shown on Form OS-A, and the equated net tons of fuel consumed is shown on Form OS-E, both of those forms are required monthly by the Interstate Commerce Commission.

Q. Do you have these forms, OS-A and OS-E to the extent that they have been used in the preparation of Exhibit 162 for identification available here in the courtroom?

A. Yes.

Q. And I think you have stated already that you have [fol. 2189] the annual reports on Form A to the Commission?

A. Yes.

Q. Likewise available. Has the exhibit been compared and checked as to the original figures and checked as to the compilations?

A. Yes, and the exhibit is correct to the best of my knowledge and belief.

Q. There are certain computations which appear in the two columns furthest to the right on the exhibit. Are those computations explained by the headings?

A. Yes.

Q. Have those computations likewise been checked?

A. They have been spot-checked by me, and they are correct to the best of my knowledge and belief.

Mr. Mason: Have you any questions, Mr. Strouss?

Mr. Strouss: Mr. Masson, on Item 1, you have an increase of mileage of road operated?

A. No.

Q. That item, assume a mile of single track and a mile of double track road, would the double track be considered as one mile of road operated, or two [fol. 2190] miles?

A. That would be one mile. This is miles of road point to point. If we were speaking of tracks, we would say track-miles, that would include first, second and third track, and so on.

Q. You say point to point. Now, your line by way of Lordsburg, and your line by way of Douglas are considered as separate lines in this miles of road operated, are they not?

A. Yes.

Q. Although they both go from Tucson to El Paso?

A. No, we don't consider that as a second track.

The Court: Is that by reason of the fact they serve different territory?

A. Yes.

Q. They are not parallel in any sense of the word except for a short distance?

A. That is true.

Mr. Strouss: Your increases shown in miles of road operated are due to the acquisition of additional roads like the E. P. & S. W.?

A. Yes.

Q. And possibly the construction of some

[fol. 2191] A. Over the period of years, Mr. Strouss, from 1922 to 1939, that mileage figure is affected by the acquisition of lines, such as the Arizona Eastern and the El Paso and Southwestern, by the construction of new lines and by the abandonment of other lines.

Q. And usually your abandonment is due to the fact that a line has become unprofitable?

A. That is the only reason we would abandon the line.

Mr. Strouss: That is all.

Mr. Mason: We offer the exhibit in evidence as Defendant's Exhibit 162.

Mr. Strouss: No objection.
The Court: It may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 162.")

[fol. 2192] Mr. Mason: Refefring to certain details in this exhibit, Mr. Masson, I wish first you would refer to item 4. Does the character of the commodities handled have any effect upon the figures shown in line 4.

A. Yes, they would be affected by heavy or light loading.

Q. For example, if the tonnage handled in a particular year consisted in large part or to a more considerable extent than in other years of such commodities as coal or ore, loading fifty tons to the car or somewhere in that neighborhood, would that have an effect upon the net tons per train?

A. Yes.

Q. Suppose that in another year the traffic consisted more largely of light loading commodities such as hay or lettuce would there be a corresponding or to some extent reduction?

A. Yes.

Q. In item 6 you speak of average capacity per freight-carrying car. Does that include only boxcars or does it include other type of equipment such as open-top equipment?

A. That includes everything, boxcars, flat cars, stock cars, gondola cars, etc.

Q. Oil tank cars if owned by the company?

[fol. 2193] A. Everything, all types of cars.

Q. Does it include refrigerator cars not owned by the company?

A. No.

Q. Is there any relation or coordination between the freight train speed in miles per hour appearing in line 7 and the gross ton miles per freight train hour appearing in line 8?

A. Yes, the faster you run your trains the more tonnage you get over the road within a space of time.

Q. Is there any interdependence as between the figures in line 8 and the figures in line 7?

A. Yes.

Q. Will you explain how the figures in line 8 are dependent, if they are, upon those in line 7 and what other factor enters into the gross ton-miles per freight train hour?

A. The gross ton-miles per freight train hour are determined by taking the gross ton-miles handled in the year and dividing that figure by the total freight train hours. A freight train hour represents the lapse of time from terminal to terminal. As I said before, the faster you run your trains over the road the more tons you will transport over that road in a specified time or in the time [fol. 2194] it takes the train to make the run between terminals. Does that answer your question?

Q. I think you have explained that the figure of gross ton-miles per freight train hour is a function of the speed of freight trains. Does it have anything to do with the loading of the freight trains?

A. Yes.

Q. Perhaps I should ask the question this way, will the figures in line 8 expressing gross ton-miles per freight train hour tend to increase or decrease as the trains become longer and contain more gross tonnage?

A. The more tonnage you cram in a train, the more your gross ton-miles per freight train hour will increase.

Q. Provided you also continue or increase the speed, is that correct?

A. Yes, assuming that we have the same speed as shown in 1939, 16.7, and assuming that we had a greater tonnage moved within the same space of time as is taken into this calculation, the figure shown in 1939 instead of being 36,364 would have been somewhat greater. Does that clear it up?

Q. Yes, I think it does. What is the significance of the figure in line 9, is that equally the function of train speed [fol. 2195] and loading?

A. Yes, and my remarks regarding item 8 would apply with equal force to item 9.

Q. Is item 9 to any extent affected by the character of the commodities handled, whether predominantly light loading or heavy-loading commodities?

A. Yes, it would be.

Q. Do the figures in item 8 have within them any similar effect?

A. Yes, item 9 is included in item 8.

Q. Referring to item 10, what is the significance of the showing of gross ton-miles per ton of fuel?

A. That indicates an economy of operation.

Q. Will you say whether from your experience as an accounting officer the figure of gross ton-miles per ton of fuel is in any respect, and, if so, to what respect, an index of the efficiency of locomotive operation?

A. The more work you can get out of a locomotive for a ton of fuel the less will be your expense for that fuel. Therefore, if you have got more gross tons over the road as this indicates over the period of years per ton of fuel, you are certainly saving yourself some money in the oper-
[fol. 2196] ation of the railroad.

Q. Do I understand you to say that all of these operations relate to both main and branch line operations?

A. Yes sir.

Q. Do the lengths of branch line trains enter into the average figure of freight cars per freight train in line 3?

A. Yes, sir.

Mr. Mason: Have you any questions, Mr. Strouss, before we pass to another exhibit?

Mr. Strouss: I think I would rather take up the whole cross-examination at once.

Mr. Mason: Mr. Mason, have you before you an exhibit in one sheet bearing title similar to that of exhibit No. 162, this exhibit relating to the Tucson division for six years since and including 1930?

A. Yes.

Mr. Mason: May this be marked for identification?

The Court: It may be marked.

The Clerk: Defendant's exhibit No. 163 for identification.

Mr. Mason: Was that prepared in the same manner as exhibit No. 162?

[fol. 2197] A. Yes.

Q. I notice that you show a different source. Will you explain the source of the figures in these several items?

A. Exhibit No. 162 as stated was taken from the OS-A reports and the annual reports to the Interstate Commerce Commission; that covers the entire system. There is no corresponding report by divisions but there is a report

rendered according to the same manner that is prepared by divisions for purposes of the management of the company.

Q. Is that form 521 referred to in the source?

A. Yes.

Q. Is form 521 kept monthly and accumulated by months and by years?

A. Yes.

Q. It is kept by divisions, is it?

A. Yes.

Q. By the system as a whole?

A. Yes.

Q. Do the figures on form 521 correspond to the figures reported to the Interstate Commerce Commission on the OS forms to which you have referred?

A. The basic figures do.

The Court: This particular report that you referred to is not prepared for the Interstate Commerce Commission, [fol. 2198] it is merely for the use and enlightenment of the company itself?

A. Yes, it is prepared as I say according to the method prescribed by the Interstate Commerce Commission. As a matter of fact, it is a breakdown of the Interstate Commerce Commission figures.

Mr. Mason: Do the same figures appear on the form 521, plus some others which appear on the forms OS-A, OS-B, and OS-E?

A. Yes.

Q. I understand, and will you correct me if I am incorrect, that form 521 has been requested by and furnished to Mr. Strouss for the Tucson division as well as the system for several years past?

A. Yes.

Mr. Strouss: That is right, I have them.

Mr. Mason: Is form 521 a condensed record regularly kept in the ordinary course of the company's business?

A. Yes.

Q. Based upon individual reports of various matters rendered by the divisions and other sources of original information?

A. Yes.

Q. Are the forms 521 preserved as permanent records [fol. 2199] of the company over a considerable period of years?

A. Yes.

Q. Have you available the forms 521 from which exhibit No. 163 for identification was prepared?

Mr. Strouss: I have copies of them myself.

A. We have them in the city but they are not in court inasmuch as they have already been furnished to counsel and I thought it unnecessary to bring them into court.

Mr. Mason: Has exhibit No. 163 been compared against these underlying sources?

A. Yes, sir.

Q. There are certain computations which are indicated and appear on the face of the exhibit. Have those computations been checked?

A. They have.

Q. Will you say whether or not the exhibit is true and correct as reflecting the underlying sources?

A. To the best of my knowledge and belief it is correct.

Q. As to line 6, I will ask you if line 6 is the same for the corresponding years as line 6 of exhibit No. 162?

A. Yes.

Q. Why is that?

[fol. 2200] A. Cars are not assigned to divisions; they are used all over the system. Therefore, the Tucson division has access to the same class and type of cars that other divisions have.

Q. As to average tractive power per locomotive, is that based upon divisional figures?

A. That is based upon assignment of locomotives to a division.

Mr. Mason: Have you any questions on exhibit No. 163, Mr. Strouss?

Mr. Strouss: No, I have none.

Mr. Mason: We offer the exhibit in evidence as defendant's exhibit No. 163.

Mr. Strouss: I do have one question. I notice that exhibit No. 162 relates to years 1922, 1924, 1926, 1928, and 1939 and that exhibit No. 163 does not include those first four years, that is, 1922, 1924, 1926, and 1928.

A. I am glad you asked that question, Mr. Strouss. The facts are these, the limits of the Tucson division were changed several times. The division as now constituted was determined or prescribed as of August 1, 1930. To make these figures comparable, we began with 1930 and when you review these figures for 1930 you will not find them on the 521 that was rendered for the year 1930 but [fol. 2201] you will find them on the 521 that was rendered for the year 1931, at which time the figures were restated to make them comparable because of the change in the limits of the division.

Mr. Mason: Your 521 for the year 1931 would contain figures for the prior year for the purpose of comparison?

A. Yes.

Q. So the 1930 figures appear in the 1931 form?

A. Yes, that is what I meant to convey.

Mr. Mason: Does that answer your question, Mr. Strouss?

Mr. Strouss: Yes.

Mr. Mason: Is the exhibit admitted, Your Honor?

The Court: Yes, it may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 163.")

Mr. Mason: Are the figures in column 1 on this exhibit, the per cent of increase and so forth, susceptible of comparison with the figures of per cent of increase appearing on exhibit No. 162?

A. Yes.

Q. Are they predicated upon the same class and method of computation?

A. Yes.

[fol. 2202] Q. The underlying figures which are compared represent the same things, do they?

A. They do.

Q. These variations in mileage in line 1 as between 1930 and subsequent years are simply due to abandonment of branch lines?

A. Yes.

Q. Do those figures include branch line operations on the Tucson division as well as the main line?

A. Yes.

The Court: You will not be able to finish with this witness before noon?

Mr. Mason: No, Your Honor.

The Court: We will recess at this time until 2 o'clock.

(Thereupon the court stood at recess until 2 o'clock P. M. this day, January 14, 1941.)

[fol. 2203] 2 P. M., January 14, 1941.

All parties being present as heretofore noted, proceedings were resumed as follows:

Mr. Mason: Mr. Strouss, this morning in connection with certain testimony or questions of the witness I think I stated there were no valid differentials for mountain districts and for engineers in freight service. I have consulted the agreement with the Brotherhood of Locomotive Engineers and I find there are distinctions between valley districts and mountain districts in Sections 2 and 3 of Article 1 of the engineers' agreement, effective January 9, 1931, but the mountain districts are defined and they do not include any territory in either Nevada or Arizona except that part of the Sacramento division west of Sparks, approximately eighteen or nineteen miles between the California state line and Sparks, I have forgotten just what the distance is.

Mr. Strouss: I assume before you rest your case you will have all of those exhibits?

Mr. Mason: We will have all of those rates of pay in here by exhibit. I will show you the paragraph to which I was referring. I don't want that statement of mine as to lack of differentials to appear in the record although it wouldn't [fol. 2204] materially affect the situation we were discussing this morning. I have also here the current firemen's, conductors', and trainmen's agreement which covers the rates of pay for brakemen, conductors, and firemen which will indicate the rate per 100 miles in each of the districts with which we are concerned, but those are likewise shown by exhibit in connection with our later showing.

Q. Mr. Masson, I think I asked you during the course of the examination this morning if you would make a calculation of the average cars per train in Arizona during the

four-year periods which are referred to on exhibit No. 151, 160, and 161 for the purpose of making the comparisons in showing the trends of averages of freight operating and freight transportation expenses. Have you those figures as calculated from exhibit No. 149?

A. Yes.

Q. What was the average cars per train in Arizona calculated from exhibit No. 149 for the period 1922 to 1925, inclusive?

A. 54.42.

Q. What was the average cars per train for the years 1936 to 1939, inclusive?

A. 53.85.

Q. Referring to exhibit No. 150. For the four-year [fol. 2205] period, 1922 to 1925, inclusive, what was the average cars per train for the state of Nevada?

A. 53.09.

Q. That is the figure that corresponds to the 54.42 you just recited?

A. Yes, sir.

Q. What is the average cars per train for Nevada for the four years, 1936 to 1939, inclusive?

A. 76.28.

The Court: Does the Nevada Train Limit Law, which I understand is somewhat similar to the Arizona law, have any bearing on the figures you have just given?

A. No, sir, the Nevada Train Limit Law never became operative.

Mr. Mason: Your Honor, as the report will show in the Federal court, 18 Fed. 2nd 393, we obtained a temporary injunction shortly before the effective date of the statute which was continued in effect pending the trial and was followed by a permanent injunction dated February 23, 1937, so that the Nevada law never actually became effective and was never observed.

Q. Our last exhibit was No. 163, was it not?

A. Yes.

Q. I hand you a statement in one sheet entitled "South- [fol. 2206] ern Pacific Company-Pacific Lines, Freight Service Operating Averages, Salt Lake Division." May that be marked No. 164 for identification?

The Court: It may be marked.

The Clerk: Defendant's exhibit No. 164 for identification.

Mr. Mason:

Q. From what sources was exhibit No. 164 prepared?

A. As shown in the lower section of the exhibit. The basic data were computed first from the form 521 and item 5 is based on the locomotives assigned to the division. Item 6 is the same as is shown on exhibit No. 162 for the system.

The Court: Mr. Masson, with reference to this exhibit No. 164 and the previous one, when you referred to the Tucson division and Salt Lake division do you have reference to that territory embraced in what is designated as a division in exhibit No. 154?

A. Yes, sir.

Mr. Mason: I will ask you, is exhibit No. 164 for identification made up in the same way and from sources exactly similar to those used in preparing exhibit No. 163?

A. Yes.

Q. Except that the forms 521 here used are those pre-
[fol. 2207] pared for the Salt Lake division?

A. For the Salt Lake division.

Q. It goes back to the year 1930, I notice. Is that in order to make it comparable with exhibit No. 163 relating to the Tucson division?

A. Yes, inasmuch as we began the exhibit with 1930 for reasons that I stated, the Salt Lake division was confined to the same period of years for comparative purposes.

Q. Do I understand that these forms 521 are kept by operating divisions rather than by states?

A. By operating divisions, yes, sir.

Q. Would it be possible to prepare from the forms 521 a showing for the state of Nevada or the state of Arizona as distinguished from either of these two divisions?

A. No.

Q. Is that the reason for showing the Salt Lake division instead of the state of Nevada?

A. Yes, sir.

Q. And the same way for the Tucson division instead of the state of Arizona?

A. Yes.

[fol. 2208] Mr. Mason: Has the showing on exhibit 164 been checked as to the original figures, and checked also as

to the computations to determine whether they are true and correct?

A. They have been spot-checked by me.

Q. Will you say whether or not, in your opinion, the exhibit is true and correct?

A. It is correct to the best of my knowledge and belief.

Q. Is it also true that the forms 521 for the Salt Lake Division for the years covered here have been furnished to Mr. Strouss?

A. Yes.

Mr. Mason: Is that correct, Mr. Strouss?

Mr. Strouss: Yes, I have them.

Mr. Mason: Have you any questions, Mr. Strouss, before the exhibit is offered?

Mr. Strouss: Yes, I have one.

Q. Mr. Masson, are there any formulae that enter into the preparation of this exhibit?

A. No, there is no formula as such. Miles is a straight record; the figures freight-train-miles is an accumulated figure from wheel reports, the net ton-miles the same, the average tractive power of locomotives is a record figure, average capacity of freight carrying cars is of record in [fol. 2209] the annual reports, the freight train speed is simply a computation from the form 521.

Q. Well, these items now that are in the annual reports, they are not computed according to any formula of the Commission of Nevada?

A. Well, this is—the average tractive power for locomotives is not computed according to the I. C. C. or any formula laid down by the I. C. C. It is simply the tractive power of engines assigned to the division, divided by the number of engines.

Q. I don't mean that. Is there any one item of these ten items here which would be computed or in which the computation would involve a formula required by the Nevada Commission similar to the allocation of expense and revenues?

A. No.

The Court: In other words, I think what Mr. Strouss is getting at, the Company prescribes the formula rather than any state commission.

A. No, sir. These figures are computed in the same manner, using the factors of the same nature as is used in pre-

paring information for the Interstate Commerce Commission on Form OS-A. This is well known and established statistics that have been used over a long period of years, [fol. 2210] it has been known and almost, you might say, evolved from constant use back over a period of years that the train-miles shall be accumulated from the wheel reports.

The Court: Let us put it another way, Mr. Masson: Now, you testified with reference to certain other exhibits that they were not exactly comparable by reason of the different requirements of the State regulatory commissions?

A. Yes, sir.

Q. However, now you are submitting an exhibit one that shows this statistical data for the Tucson Division, and this last exhibit, No. 164, the statistical data for the Salt Lake Division; now, at least as to those two exhibits, the one covering the Salt Lake Division, and the one covering the Tucson Division, they are prepared; I take it, that is, they are prepared in accordance with exactly the same formula.

A. The same formula doesn't apply to this. The formula prescribed by the states prescribes the allocation of revenues and expenses. This is simply mathematical computation from those basic figures that have been determined from those formulae.

The Court: Then these figures are comparable.

[fol. 2211] Mr. Mason: Are there any formulae involved in accumulating miles of freight trains operated?

A. No.

Q. Are there any formulae involved in accumulating freight car-miles operated?

A. No.

Q. Those are figures that appear on basic reports?

A. That is true.

Q. The wheel reports. Is there any formulae other than a straight division of freight train car-miles, or freight train miles in getting freight train car-miles?

A. No.

Q. His Honor asked whether the formula or method, he might have said, involved in obtaining the results on exhibit 164, are the same as or in any respect differ from those used in obtaining the results on exhibit 163?

A. No, no difference.

Q. They are identical basic records?

A. Yes.

Q. Except that the basic records, such as the showing of train operations and train loading for the Tucson Division, are used in one case, and the one for the Salt Lake Division [fol. 2212] is used in the other?

A. Yes.

Q. This does not involve any use at all of State Commission formulas as to the two states?

A. No.

Q. Does the State Commission of Nevada in the case of the Salt Lake Division, or the State of Arizona in the case of the Tucson Division, have anything at all to do with these figures appearing on exhibits 163 and 164?

A. No, it doesn't.

Mr. Mason: Does that make it clear?

The Court: Yes.

Mr. Mason: I will offer the statement as Defendant's Exhibit No. 164 in evidence.

Mr. Strouss: Objected to as irrelevant and immaterial.

The Court: The objection is overruled. It may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 164.")

Mr. Mason: Mr. Masson, are there any particular figures on Exhibit 164 to which you wish to direct attention in connection with Exhibit 163?

[fol. 2213] A. Yes, the comparison drawn from the last column which expresses the per cent of increase.

Q. Comparing 1939 with 1930?

A. Yes; the freight cars per freight train in Arizona decreased.

Q. In Arizona, or on the Tucson Division?

A. On the Tucson Division, I should say, decreased 2.2 per cent; on the Salt Lake Division, they increased 10.8 per cent. The net tons per train, net tons per freight train on the Tucson Division increased 10.2 per cent. On the Salt Lake Division they increased 17.7 per cent. The average tractive power for locomotives on the Tucson Division increased 11.6 per cent, and on the Salt Lake Division it increased 35.5 per cent. The average capacity of the freight carrying cars, of course, are the same for the System as on all divisions. The capacity of freight carrying cars increased .2 per cent on the System. On the Tu

son Division and on the Salt Lake Division. Freight train speed on the Tucson Division increased 21.7 per cent, on the Salt Lake Division 21.1 per cent. Gross ton-miles per freight train-hour increased on the Tucson Division 28.3 per cent; on the Salt Lake Division 41.8 per cent. Net ton-[fol. 2214] miles per freight train-hour increased on the Tucson Division 33.8 per cent; on the Salt Lake Division 42.2 per cent. Gross ton-miles per ton of fuel increased on the Tucson Division 8.8 per cent; on the Salt Lake Division 15.3 per cent.

Q. Have you before you, Mr. Masson, a statement in one sheet entitled "Average Freight Revenue Per Train-Mile, Car-Mile, and One Thousand Revenue Ton-Miles, Pacific Lines, Compared with States of Nevada and Arizona, Respectively?"

A. Yes.

Mr. Mason: May the statement be marked "Defendant's Exhibit 165 for identification?"

The Court: It may be marked.

The Clerk: Defendant's Exhibit No. 165 for identification.

Mr. Mason: Did you prepare exhibit No. 165, or have it prepared, Mr. Masson?

A. I had it prepared; it was prepared under my supervision and direction.

Q. From what sources?

A. Items 1, 2 and 3, annual reports to the Interstate Commerce Commission, Public Service Commission of [fol. 2215] Nevada, and Corporation Commission of Arizona.

Q. Do the figures in items 1 and 2 for the System, and each of the two states, appear as such in the annual reports?

A. Items 1 and 2, years 1923 to 1935, inclusive, appear in Schedule 531, entitled, "Statistics of Rail-Line Operations" of the annual report to the Interstate Commerce Commission, and the corresponding schedules of annual reports to the respective states. However, as such averages are not required in the annual reports for the years 1936 to 1939, they have been computed for the purposes of this exhibit.

Q. Is that computation straight division of total freight revenue divided by the total freight service train-miles or the total loaded freight train-miles in the other as reported to the several commissions?

A. Yes, the basic figures appear in the annual reports.

[fol. 2216] Mr. Mason: Are the figures for 1936 to 1939 for the two states reported as such or are they computed figures as well?

A. They are computed figures.

Q. They are all computed figures for the last four years?

A. Yes.

Q. Revenue per 1,000 ton-miles of freight, is there in the annual report an entry of the average revenue per ton mile?

A. Yes.

Q. You obtained these figures here simply by moving the decimal point three places?

A. Yes.

Q. Has the exhibit been checked against the underlying sources?

A. Yes, sir.

Q. Where such computations are reflected in these figures, have those been checked?

A. Yes, sir, they have been spot-checked by me.

Q. Will you say whether or not in your opinion the exhibit is true and correct?

A. It is correct to the best of my knowledge and belief.

Mr. Mason: Have you any questions, Mr. Strouss?

[fol. 2217] Mr. Strouss: No questions.

Mr. Mason: We offer the exhibit in evidence as defendant's exhibit No. 165.

Mr. Strouss: I object to it as irrelevant and immaterial.

The Court: Objection overruled, it may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 165.")

Mr. Mason:

Q. As between the items designated by the column headings 1, 2, and 3 on exhibit No. 165, Mr. Masson, which of the three, if any, is affected by increases or reductions in average train lengths?

A. Column 1, item 1.

Q. Item 1 being "Freight Revenue per Freight Service Train-Mile"?

A. Yes.

Q. Does the item of "Freight Revenue per Loaded Freight Car-Mile" in and of itself bear any result of long or short train operation?

A. No.

Q. Would the same be true as to revenue per 1,000 ton-miles?

A. Yes.

Q. Primarily what factors, if any, are determinative of [fol. 2218] the level figure per 1,000 ton-miles of freight in any year?

A. Rate has something to do with it and the length of haul.

Q. The length of haul being set aside for the moment, does the average revenue per 1,000 ton-miles or the average revenue per ton-mile reflect to any extent the average level freight rate?

A. Yes.

Q. And of the freight rate structure?

A. Yes.

Q. Does that factor plus any other factor enter into the figure of freight revenue per loaded freight car-mile, speaking of that figure in a generic sense?

A. Yes, it does.

Q. What is the other factor that enters into the revenue per loaded freight car-mile in addition to the revenue per ton-mile?

A. The distance hauled.

Q. Does the distance hauled enter into the unit revenue per car-mile?

A. Yes, it does, and the loading has something to do with it.

Q. Isn't it a fact that it is the loading times the revenue per ton-mile that enters into it?

[fol. 2219] A. I don't understand it that way. In determining this you would simply use as a factor your total car miles and your total revenue.

Mr. Strouss: Pardon me just a moment. I don't like to object to leading questions but I will have to on questions like the last one.

The Court: Yes, it was leading.

Mr. Mason: I know it was leading and I didn't like to ask it in that form.

Q. As between two successive years, whether it be for the system or either of the states, Mr. Masson, what factors affect the unit revenue per loaded car-mile?

A. The revenue for the load and the miles hauled.

Q. Will the miles hauled have any effect upon the revenue per mile?

A. It will, yes.

Q. How? I don't think my question is clear to you. I would like to have you explain that to me.

A. The longer distance you haul a car for a stated revenue the less your revenue per car mile will be.

Q. But here we have, Mr. Masson, a revenue per ton-mile?

A. Yes.

[fol. 2220] Q. That revenue per ton-mile doesn't depend upon distance, it is just a division as I understand it between the total revenue and the total number of ton-miles made, isn't that correct?

A. Yes.

Q. You just take all your ton-miles on the one hand and all your freight revenue on the other and divide and you get the figure here?

A. Yes, and you do the same thing with your car-miles.

Q. I don't think you have understood me. Having a unit revenue per ton-mile, does that figure combined with any other consideration affect the revenue per freight car-mile?

A. Naturally it would.

Q. What is that other consideration?

A. The rate, if you have a lower rate, naturally your revenue per ton-mile will be low.

Q. I am getting at the revenue per car-mile. You have the revenue per ton-mile and that as I understand you is an expression of the rate?

A. That is true.

Q. Having that and your loaded freight car-mile, what factor combined with the revenue per ton-mile produces the revenue per car-mile, if you please?

[fol. 2221] A. I am sorry, I don't understand the question.

Q. All right, I will not lead you any further, I thought it would be perfectly obvious. Mr. Masson, of what is the load in a freight car made up expressed in weight?

A. Tonnage.

Q. Perhaps we can return to the subject again. Having expressed already revenue per ton for the movement of that car one mile, what factor combined with that revenue figure would you use in determining the revenue for the movement of the car one mile if it contains that tonnage?

A. I would use the revenue for that tonnage.

Q. How would you obtain the revenue for the total tonnage loaded in the car if you had the revenue for one ton?

A. Multiply it by the tons.

Q. By the loading?

A. By the loading, yes.

Q. To put it in one sentence, isn't freight revenue per loaded freight car-mile a combination of loading plus revenue per ton-mile?

A. Yes, certainly it is. I thought that was obvious.

Mr. Mason: It was, but it wasn't in the record.

[fol. 2222] Q. Let's go to column 1 because there we will obtain the result of some other computations. Having the revenue per loaded car-mile, which I think we have established as the product of ton-mile revenue plus loading——

A. (Interrupting:) It is not the profit.

Mr. Mason: I understand it is not the profit, it is the gross.

A. I understood you to say "profit."

Mr. Mason: "Product" is what I said.

A. I beg your pardon.

Q. Having established how the freight revenue per car-mile is affected by loading and ton-mile revenue, is there any factor combined with the revenue per freight car-mile which affects revenue per train-mile?

A. Yes, the number of cars in a train affects it.

Q. Provided only that they were revenue cars, I take it.

A. Naturally.

Q. Will you turn to a statement entitled "Revenue Freight Carried by Pacific Lines, Year 1939"?

A. Yes.

Mr. Mason: May we have that marked No. 166 for [fol. 2223] identification?

The Court: It may be marked.

The Clerk: Defendant's exhibit No. 16 for identification.

Mr. Mason: Did you prepare exhibit No. 166 or cause it to be prepared?

A. Yes, I caused it to be prepared.

Q. From the source as shown in the note at the foot of the exhibit?

A. Yes.

Q. This exhibit is similar in form to exhibits introduced by witnesses for other carriers who have testified here; is it not?

A. Yes, sir.

Q. Are there any computations on the face of the exhibit which you yourself made?

A. The line entitled "Total perishable products of agriculture Classes 110 to 143, inclusive" are additions made by me or at my direction.

Q. What figures were added to produce the totals shown in that line?

A. The figures from Classes 110 to 143 as shown in column A.

Q. In each of the columns C to G, inclusive, are the figures in the lines 110 to 143 added together to produce the figure next below?

[fol. 2224] A. Line 800, you speak of?

Q. No.

A. In each of the columns the total opposite line, total perishable products of agriculture, the total therein shown or opposite that line shown is the sum of classes 110 to 143.

Q. Are those figures which appear as the totals of classes 110 to 143 included within the totals appearing on lines 800 and 850?

A. Yes.

Q. These figures are taken, except as to that addition, directly from the annual report to the Interstate Commerce Commission?

A. Yes.

Q. Has the exhibit been checked against the original sources?

A. Yes.

Q. The additions have been checked, have they?
A. Yes.

Mr. Mason: Have you any questions, Mr. Stronss?
Mr. Stronss: No questions.
Mr. Mason: We offer the statement as defendant's exhibit No. 166.
Mr. Stronss: I object to it as irrelevant and immaterial.
[fol. 2225] The Court: Objection overruled, it may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 166.")

Mr. Mason: Will you turn to a statement entitled "Revenue Freight Carried within the State of Arizona, Year 1939"?
A. Yes.
Q. Did you prepare this exhibit or cause it to be prepared?
A. I had this exhibit prepared and it was prepared under my supervision and direction.
Q. From the annual report to the Corporation Commission of the state of Arizona?
A. Yes.
Q. Are there any computations on the face of the exhibit?
A. The total of items 110 to 143 appearing in columns C, D, E, and F are computations.
Q. Column C, you say "Cars Originating on Line within the State:", Just what does that mean?
A. The explanation of the column is shown at the bottom of the exhibit.
Q. Those are cars originated by the Southern Pacific, are they?
A. Yes, sir.
[fol. 2226] Q. And originating at points in Arizona?
A. Yes, sir, exclusively.
Q. Column D, are those cars handled by the Southern Pacific but not originated in Arizona?
A. Yes.
Q. What does column E indicate with relation to columns C and D?
A. That is a total of columns C and D made up of cars originating on the lines and all other cars handled within the state.

Q. As to column F, your explanation indicates that they are included within the preceding columns?

A. Yes, sir.

Q. Those are cars delivered within the state, are they?

A. Yes.

Q. If a car originated on the Santa Fe in Arizona and was received by the Southern Pacific at the junction and handled thence by the Southern Pacific, within which column would that appear?

A. Column D.

Q. If this car originated at a point in California and was handled across Arizona and delivered at a destination beyond Arizona, in which column would it appear?

[fol. 2227] A. Column D.

Q. If a car originated at Yuma and was handled by the Southern Pacific Company to a destination by the Southern Pacific Company to a destination beyond the state, where would that appear?

A. In column D.

Q. If it originated at Yuma?

A. It would appear in column C.

Q. If it originated at Yuma and was delivered at Tucson, would it also appear in column F?

A. Yes.

Q. Has the exhibit been checked to determine its correctness?

A. Yes.

Q. Will you say whether or not it is true and correct?

A. It is true and correct to the best of my knowledge and belief.

Mr. Strouss: Does this include cars originating in Mexico?

A. Handled through the state or into the state, yes.

Mr. Mason: We offer the statement in evidence as defendant's exhibit No. 167.

Mr. Strouss: No objection.

The Court: It may be admitted.

(The document referred to was received in evidence and [fol. 2228] marked "Defendant's Exhibit No. 167.")

Mr. Mason: Have you a statement before you in one sheet entitled "Revenue Freight Carried within the State of New Mexico, Year 1939"?

A. Yes.

Mr. Mason: May we have that statement marked "Defendant's exhibit No. 168" for identification?

The Court: It may be marked.

The Clerk: Defendant's exhibit No. 168 for identification.

Mr. Mason: Did you prepare exhibit No. 168 for identification or cause it to be prepared?

A. I had this exhibit prepared, it was prepared under my supervision and direction.

Q. From the annual report to the New Mexico commission?

A. The annual report to the Corporation Commission of the state of New Mexico.

Q. For the year 1939?

A. Yes.

Q. Was this prepared in the same manner as exhibit No. 167?

A. Yes.

Q. And the significance of the columns is as explained in the footnotes?

A. Yes.

[fol. 2229] Q. And the same as corresponding columns on exhibit No. 167?

A. Yes.

The Court: Mr. Masson, you may not be able to answer this question, but does the fact that in column C there are no figures there and it appears blank, which would indicate that the state of New Mexico produces none of these perishable products, does that mean that your lines don't haul them or that none are actually produced in the state?

A. That means that our line did not originate any of these perishable products in New Mexico. The state may produce them.

The Court: Your records do not disclose that?

A. Our records show that we originated no such traffic in New Mexico.

Mr. Mason: It is indicated there that the company did originate a certain number of cars of agricultural products within the state but those were all other than perishable?

A. All other than perishable as identified by these items 110 to 143.

Mr. Mason: Have you any questions, Mr. Strouss?

Mr. Strouss: No.

Mr. Mason: I don't know that the record shows, but if not, [fol. 2230] will you state whether the annual report to the New Mexico commission for the year 1939 is available here in the courtroom or in the city at the present time for Mr. Strouss if he wishes to examine it?

A. Yes, they are in the city.

Mr. Strouss: I would like to get it when you have finished with your testimony.

Mr. Mason: This report and any of the other New Mexico commission reports that we may use will be furnished.

Q. You show all other cars handled on line within the state in column D here, Mr. Masson. Would that include cars which in the year 1939 moved or were handled in the state of Arizona, if not delivered in that state, and which moved over the Arizona-New Mexico boundary?

A. It would include a majority of those cars which originated in Arizona and moved out of the state.

Q. Which are shown on exhibit No. 167 as "All Other Cars Handled on Line within the State of Arizona" if those cars moved over the Arizona-New Mexico boundary?

A. Eastbound it would include those cars.

Mr. Mason: We offer exhibit No. 168 in evidence.

[fol. 2231] Mr. Strouss: I object to it as irrelevant and immaterial.

The Court: Objection overruled, it may be received.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 168.")

[fol. 2232] Mr. Mason: Mr. Masson, have you a statement in one sheet bearing the title "Revenue Freight Carried Within the State of Nevada, Year 1939?"

A. Yes.

Mr. Mason: May we have the statement marked "Defendant's Exhibit No. 169 for identification?"

The Court: It may be marked.

The Clerk: Defendant's Exhibit No. 169 for identification.

Mr. Mason: Did you prepare Exhibit No. 169, Mr. Masson?

A. That exhibit was prepared under my supervision and direction.

The Court: Mr. Mason, just what is the purpose of these two last exhibits, the one showing the perishables and agricultural products handled in the state of New Mexico and the state of Nevada?

Mr. Mason: Well, they complete the picture of the Company's traffic as between perishable products and other freight, which is first of all contained in Exhibit 166; that is for the System, of course, then continued on Exhibit 167, which shows what the nature of the traffic handled in Arizona is as between perishable products, agricultural traffic [fol. 2233] and other classes.

The Court: Well, that is just a break-down then of 166 by states?

Mr. Mason: Yes, it is really a showing of how much of this traffic and how much of it by classes—of course, agricultural and perishable products are segregated here—is carried in the three states. Now, in the complaint, or, rather, in the answer, the allegation is made that a large part of the traffic handled by the Company is perishable traffic and it is further alleged that a large part of the traffic handled on the line affected by the Arizona law is perishable traffic, and that a large part of the Company's business consists of agricultural products which must, as we further allege and which we shall show by other witnesses, receive expedited service in order to reach the market. We also show that a large part of the perishable traffic and a large part of the traffic across Arizona is interstate. We have previous exhibits which show the break-down between interstate and intrastate. Here we show how much of this perishable traffic is of the total, and how much of that is intrastate and handled across the state. The New Mexico showing is re- [fol. 2234] lated to the same through line which crosses Arizona, which in previous testimony is part of a through line across Arizona to principal markets. Then, in our answer we have also alleged that the traffic across Nevada, which state of course we shall undertake to compare with Arizona, is similarly largely perishable traffic and largely interstate. This showing as to Nevada tends to carry forward that the character of the Nevada traffic not in the total is not simply similar as to volume but in its characteristics it is similar. I think you will find an allegation in the answer that covers what we attempt to show by Exhibit 169.

Q. Was Exhibit 169 for identification prepared in the same manner as Exhibits 167 and 168?

A. Yes.

Q. And the source is the Annual Report to the Nevada Public Service Commission for 1939?

A. Yes.

Q. Will you say whether or not the explanation made of the preceding exhibits as to those sources apply also to this exhibit?

A. It does, yes.

Mr. Mason: Have you any questions on No. 169, Mr. Strouss?

[fol. 2235] Mr. Strouss: Just one question.

Q. The grand total of carload traffic, that means the total amount of carloads of traffic, column C, which originated in that state in 1939?

A. On our line.

Q. All of the different types of traffic?

A. Yes; originating on our line, the Southern Pacific; not all traffic originating in the state which may have moved over our line. All types of traffic is shown in column C.

Q. If it came to you from some other carrier but originated in the state it wouldn't be there?

A. Not in column C, no, it would be in column D.

Q. The two, then, combined would cover all traffic which originated in the state of whatever type?

A. No; the two combined would include traffic originating on our line within the state, traffic originating on foreign lines within the state handled by our lines, traffic handled through the state by our lines.

Mr. Strouss: That is all.

Mr. Mason: Is that clear now?

Mr. Strouss: I think so.

Mr. Mason: We offer the exhibit as No. 169.

[fol. 2236] Mr. Strouss: Objected to as irrelevant and immaterial.

The Court: The objection is overruled. It may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 169.")

The Court: We will take our mid-afternoon recess at this time.

(Thereupon, a short recess was taken, after which the witness L. J. Masson was recalled to the stand, and proceedings were resumed as follows:)

Mr. Mason: Now, referring to Exhibit No. 169, Mr. Masson, does that exhibit indicate the percentage or any percentage which may exist as between interstate and intrastate carload traffic in the state of Nevada for the year 1939?

A. Well, taking the traffic as a whole, out of 201,497 cars handled on the line within the state, that is in and out and through, only 5,351 cars originated in the state on our line; so that this exhibit indicates the predominance of interstate traffic within the State of Nevada.

Q. Is there any substantial volume of intrastate Nevada traffic received from connections in that state on our rail-
[fol. 2237] road and moved by our railroad?

A. There is no substantial volume, no.

Q. Would it affect the indicated relationship of interstate and intrastate on this exhibit to any appreciable degree?

A. No.

Q. Have you made studies other than the study represented by exhibit 169 of and predicated upon records of the Company with relation to the relative volume of interstate and intrastate traffic handled in the state of Nevada?

A. I did make a study of that kind some time ago, some years ago. The fact is, I know that the interstate traffic was about ninety per cent, way over ninety per cent.

Q. Was it between 90 and 95 per cent, or more than 95 per cent?

A. I have some data here, if you will let this question rest I will give you a definite figure later on.

Q. Is the showing of relative percentages of possible intrastate and interstate traffic on exhibit 169 fairly representative of other years which you have stated?

A. Yes, it is.

[fol. 2238] Mr. Strouss: Are you about to leave this exhibit?

Mr. Mason: Yes.

Mr. Strouss: I would like to ask one or two questions.

Mr. Mason: Certainly.

Mr. Strouss: I am now again confused on this freight originating within the state. Did I understand you to say that the number of cars shown in column C related to the number of cars shown in column D would indicate the percentage of interstate and intrastate traffic?

A. Yes, it would be an indication of it. Intrastate and interstate, notice that there are 5,351 cars originated in the state.

Q. But that is not just intrastate traffic, it may originate there but move again out of the state and, if so, would be interstate traffic, would it not?

A. If any one part of that moved out of the state, it would be interstate, yes.

Q. So that the figures 5,351, representing the cars originating on the line within the state, do not necessarily mean intrastate traffic?

A. No; no, I didn't mean to convey that. What I meant to convey was that this was an indication of the predom-
[fol. 2239] inance of interstate traffic.

Q. You mean predominance of interstate in the sense of traffic using Nevada as a bridge state compared with traffic originating within the state?

A. Yes.

Q. That is the sense in which you were referring to it?

A. Yes.

Mr. Mason: I think his answer was this, Mr. Strouss, that the 5,351 is the highest possible figure of intrastate cars that could have moved originating on our railroad in 1939, because those are the cars that originated within the state and, of course, as indicated, although not expressed in the answer, if any of those moved beyond the state, the figure of intrastate originating and terminating within would be somewhat smaller.

Mr. Strouss: I was just trying to find out if that is the highest number of cars of intrastate.

Q. Did you understand me correctly when I asked you, before the exhibit was received in evidence, this only rep-
[fol. 2240] resents cars which originated on your own line?

A. That is true.

Q. If there were other cars which originated on other lines than your own, then delivered to you as a connecting carrier and you in turn carried those but only within the

state, they would still be in column D, but would be intrastate traffic?

A. That is true.

Q. So that column D may include intrastate traffic as well as interstate?

A. It may.

Mr. Mason: Now, as a matter of fact, Mr. Masson, are there any short-line connections of the Southern Pacific in Nevada, and, if so, name them in 1939.

A. Short-line connections?

Q. Yes.

A. That excludes our connections with the Western Pacific?

Q. I am going to ask you about those as well.

A. We have at Cobre, Nevada, the Nevada Northern Railway.

Mr. Strouss: Where is that?

A. Cobre.

Mr. Mason: That line lies entirely within Nevada, does [fol. 2241] it?

A. Yes. Nevada Copper Belt Railroad at Wabuska; the Tonopah and Goldfield at Mina. Those are about the only short lines.

Q. Is there the Virginia & Truckee at Reno?

A. Yes, there is.

Q. Now, are there any trunk line connections?

A. The Union Pacific at Wells, and the Western Pacific at several points.

Q. The Western Pacific at Reno and at all points between Winnemucca and Wells?

A. Yes.

Q. Now, does the Southern Pacific receive any substantial volume of intrastate traffic from any of those four short-line connections that you have mentioned?

A. We receive no substantial amount; just how much I can't say, at present.

Q. Well, would it exceed 500 cars a year from all four of them, intrastate traffic?

A. I question whether it would.

Mr. Strouss: You say from all four of them?

Mr. Mason: Yes, the Nevada Northern, the Nevada Copper Belt Line, the Tonopah and Goldfield, and the Virginia & Truckee.

Mr. Strouss: You are not including the Union Pacific [fol. 2242] or the Western Pacific?

Mr. Mason: No, those are trunk-line connections. I distinguished between trunk-line and short-line connections.

The Witness: I think I have something here that will enable me to answer your question. The study I made sometime ago on traffic moving from 1930 to 1934 showed that 99 per cent of the traffic, of the freight revenues in the state of Nevada were interstate, were derived from interstate traffic, and about the same percentage of ton-miles within the state of Nevada represented interstate traffic.

Q. Now, do you know, and if so, will you state whether the Southern Pacific receives from the Union Pacific or the Western Pacific any substantial volume of carload traffic originating at and destined to points within the state?

A. No, I don't believe there is any substantial amount of traffic.

Q. By substantial, I mean in excess of, let us say, fifty or 100 cars a year?

A. I am not in position to answer that definitely.

Q. You say that your studies previously made indicate [fol. 2243] that 99 per cent, approximately, of the revenue received by the Company from freight service and the ton-miles handled in Nevada, were interstate?

A. Yes.

Q. That applies to all traffic, whether inter-line or local traffic, does it?

A. Yes.

Q. I will ask you to refer to the annual report to the Nevada Commission for the year 1939, to schedule 710, and to line No. 1, Item 101, on page 700 of that annual report, and state the figures reported to the Nevada Commission as to revenues earned within the state on intrastate traffic and on interstate traffic?

A. Revenues earned within the state of Nevada on intrastate traffic for the year 1939 was $58,878; revenues earned on interstate traffic within the state of Nevada was $18,300,291. The total freight allocated to the state of

Nevada in the year 1939, total freight revenue I should say, was $18,323,903.

Q. Are those revenues apportioned to the State on the prorate basis that you spoke of?

A. Those revenues are apportioned to the State on a mileage prorate basis.

[fol. 2244] Q. Is that the same as is used in Arizona in proportioning revenue?

A. Yes.

Mr. Strouss: You mean the same formula in each state?

A. Yes, apportioned to the state, apportioned according to the mileage hauled within the state, the ratio of miles in the state to the total miles hauled.

Q. The same formula is used in Nevada?

A. Yes.

Mr. Mason: Has No. 169 been offered and received?

The Court: I don't think so, Mr. Mason.

The Clerk: It was admitted, yes, just before we took our recess.

Mr. Strouss: Might I ask, we haven't developed what the cars, total cars originating in the state, both on your line and connecting lines is. Could you get that figure without a great deal of trouble as to all three states?

Mr. Mason: Cars originating on line and on connecting lines within the state?

Mr. Strouss: Within the state, originating within the state.

The Court: May I suggest to the witness, because appar-[fol. 2245] ently he hasn't some of this data available to give the information, that he have it tomorrow morning.

Mr. Strouss: I meant, could it be gotten without too much trouble.

The Witness: No, we have to re-work the details.

Mr. Mason: These figures, as I understand, are taken, so far as cars originating on line are concerned, are taken from annual reports?

A. Yes.

Q. And are readily available there, but to get the statistics for these three states of cars from connecting lines within the state——

A. We would have to pick out the cars originating on foreign lines. We make no distinction of that kind in our statistics.

Q. What would that involve, a check of waybills?

A. Yes, it would, a check of the movement going back to the waybills.

Mr. Strouss: If it is a great deal of trouble, I won't ask for it.

The Witness: It can be had, you know.

Mr. Mason: Would it be a special job as distinguished [fol. 2246] from these statistics in the ordinary course?

A. Yes, sir.

Mr. Mason: Would you still wish it?

Mr. Strouss: No, I will waive it.

Mr. Mason: Now, as to the next exhibit, have you a statement before you, Mr. Masson, in one sheet entitled "Segregation of Freight Car-Miles in States of Nevada and Arizona and for Pacific Lines as a Whole?"

A. Yes.

Mr. Mason: May we have that marked No. 170?

The Court: It may be marked.

The Clerk: Defendant's Exhibit No. 170 for identification.

Mr. Mason: Did you cause Exhibit No. 170 for identification to be prepared, Mr. Masson?

A. Yes.

Q. From what sources?

A. It was prepared from the underlying records in our office. The total agrees with the annual reports, as shown in the footnotes, and items 1 to 4 are simply a break-down of the total as between these various classes of cars.

Q. When you say "underlying records" in your office, are those the wheel reports or the intermediate computa- [fol. 2247] tions prepared from the wheel reports?

A. The accumulated records from the wheel reports.

Q. Are those regularly prepared in the office of the auditor of Equipment Service Accounts?

A. Yes.

Q. Are these computations of movement of foreign line, Pacific Fruit Express Company and other private car line cars necessary in the course of the Company's business?

A. Yes.

Q. Do you base car rental payments to any extent upon the statistics of car-miles for P. F. E. and other private car line cars?

A. Yes; not only that, taxes are assessed on the basis of miles made by private line cars within states.

Q. Are the mileages within the several states necessary for these several purposes?

A. Yes.

Mr. Mason: Mr. Strouss, will you wish those intermediate records for the purposes of this exhibit?

Mr. Strouss: No.

Mr. Mason: Has the exhibit been checked against the underlying records, Mr. Mason?

[fol. 2248] A. Yes, sir.

Q. And what as to the computations in columns D, F and H; were these made by yourself?

A. Those were computations made at my direction and under my supervision to indicate the percentage of the respective classes of miles made.

[fol. 2249] Mr. Mason: Are these computations made from the total figures on the figures by classes which appear in columns C, E, and G?

A. Yes.

Q. So that the percentage figures in column D for the lines 1, 2, 3, and 4 add up to one hundred in each case in line 5?

A. Yes.

Q. Have these percentages and other computations been checked as well as the original entries?

A. Yes, they are correct according to the best of my knowledge and belief.

Q. These other private car-line cars, would that include only refrigerator cars or would other types of equipment be included?

A. It would include tank cars and private refrigerator cars owned by packing houses and so on.

Q. Would it include F. G. E. refrigerator cars?

A. Yes, sir, S. F. R. D. cars.

Q. Would S. F. R. D. cars go under "private car lines" or under "foreign lines"?

A. Private car lines, they are on a mileage basis—pardon me, your question just dawned on me, you asked if

the S. F. R. D.'s would go under foreign lines or private car lines and my answer was wrong. It should go under foreign lines, S. F. R. D., the Santa Fe owned refrigerator [fol. 2250] cars.

Q. Does this include empty as well as loaded movement of these cars?

A. Yes, sir.

Q. Is there any formula used to apportion these mileages to the several states or what is the method of obtaining the mileages for the several states?

A. It is the actual miles made within the state as computed from the wheel reports.

Q. Are these figures in essence simply an aggregation of the mileage appearing on the individual wheel reports?

A. Yes.

Mr. Mason: Have you any questions, Mr. Strouss?

Mr. Strouss: I notice item 4, cars owned by Pacific lines, do you distinguish between Pacific lines and Southern Pacific Company there?

A. There would be no distinction there because all cars owned by the Southern Pacific Company are all operated by Pacific lines or affiliated lines. These are cars of Southern Pacific ownership making miles on Pacific lines.

Mr. Mason:

Q. Do you distinguish in that connection between cars [fol. 2251] stencilled with the name "Texas and New Orleans" or the other Texas and Louisiana companies?

A. Yes, that is distinguished as shown by that note. The Texas and New Orleans cars are included in the foreign line cars.

Q. Suppose that a car of Pacific Electric ownership is handled on the company's lines, where is that shown?

A. That is shown in foreign lines.

Q. Suppose it is a Northwestern Pacific car?

A. That is shown in foreign lines as the note indicates, includes cars owned by Texas and New Orleans Railroad Company and other separately operated companies solely controlled by the Southern Pacific Company.

Q. Do I understand that these cars whose movement is shown in line 4 includes only those cars that are stencilled

"Southern Pacific Company" without any reference to one of the affiliated companies?

A. That is correct.

Mr. Mason: Have you any other questions, Mr. Strouss?

Mr. Strouss: No other questions.

Mr. Mason: Your Honor, I may explain that this exhibit undertakes to show the important part played in the [fol. 2252] movement on the lines as a whole and in Nevada and Arizona of the refrigerator cars and the Pacific Fruit Express Company and also as an indication of the perishable traffic and also that our company handles the cars of other railroad ownership on its lines in both states as well as on the system generally. We offer the exhibit as defendant's exhibit No. 170.

Mr. Strouss: I object to it as irrelevant and immaterial.

The Court: Objection overruled, it may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 170.")

Mr. Mason:

Q. Mr. Masson, have you before you a statement in two sheets bearing title, "Lines and Operations Abandoned under Authority of Interstate Commerce Commission (Exclusive of Electric Lines in California and Oregon), Period January 1, 1930, to December 31, 1939, Inclusive"?

A. Yes.

Q. Did you prepare this exhibit?

A. Yes, I did.

Mr. Mason: May we have it marked No. 171 for identification?

The Court: It may be marked.

[fol. 2253] The Clerk: Defendant's exhibit No. 171 for identification.

Mr. Mason: Q. What sources were employed in its preparation?

A. This was made from our basic mileage records.

Q. Do your basic mileage records show the actual date of abandonment of these several pieces?

A. Yes.

Q. From what source did you obtain the information shown in column G?

A. That was taken from our records also which were posted as and when these orders came along.

The Court: Mr. Masson, do I understand that your railroad, the Southern Pacific, or any other line cannot abandon any of its mileage, any of its roads without the consent of the Interstate Commerce Commission?

A. Absolutely correct.

The Court: Does that also require the consent, say in Arizona, of the state corporation commission?

A. No. When the application is made to the Interstate Commerce Commission the state commissions are informed of that application by copy of the application and if they have any objections they then state them to the Interstate [fol. 2254] Commerce Commission. In the absence of any objection or comment by the state commissions the Interstate Commerce Commission acts on the application after hearing.

The Court: On its merits?

A. On its merits, yes.

The Court: But there is no dual control, by that I mean the state commission couldn't veto the action of the Interstate Commerce Commission?

A. That circumstance would not arise because of the cooperation between the Interstate Commerce Commission and the state commissions. I have never known the Interstate Commerce Commission to override a state commission in matters of this kind.

The Court: In other words, do you mean to say if the Southern Pacific proposed to abandon some short line in Arizona and the Arizona Corporation Commission protested that request that the Interstate Commerce Commission would deny the request?

A. If the state of Arizona did not produce a satisfactory reason for its objection, the Interstate Commerce Commission would issue the authority to abandon. In other words, the Interstate Commerce Commission would take into consideration the arguments and facts presented by the state [fol. 2255] commission in determining its judgment.

The Court: Then there is a distinction between the abandonment of a line and the type of service that may be rendered on a line?

A. Yes.

The Court: In other words, I just noticed by the newspapers, for instance, that you proposed on the Arizona Eastern road from Bowie into Globe to cease running a passenger train that has been running. Now that is a matter over which the Arizona Corporation Commissions has exclusive jurisdiction I take it?

A. That is true.

The Court: But if you sought to abandon the line from Bowie into Globe then the Interstate Commerce Commission has the sole say.

A. That is the idea, yes, that is according to the Interstate Commerce Commission Act.

Mr. Mason: As a matter of fact, Mr. Masson, some of these abandonments, for example, going to sheet No. 2, in the state of Nevada were accomplished in spite of the protest of the Nevada Public Service Commission, were they not?

A. Yes, from Tonopah Junction to Nevada-California state line.

Q. I take it that each one of these Interstate Commerce [fol. 2256] Commission finance docket numbers is reported in the published and printed reports of the Interstate Commerce Commission?

A. Yes, sir.

Q. And what you have shown here are the finance docket numbers without the citations of the Interstate Commerce Commission's volumes?

A. That is true.

Q. Has the exhibit been compared against the record of the proceedings and against your mileage record to determine whether it is true and correct?

A. Yes.

Q. Have you checked these Interstate Commerce Commission finance docket numbers in column G?

A. Yes, I have spot-checked them.

Q. Are the dates shown in column F the dates upon which operations on the lines actually ceased and the lines themselves abandoned so far as operations were concerned?

A. Yes.

Q. You show totals for the various states. Are those to some extent an explanation of the variations in mileage in

the several states as to which you show mileage statistics for several years?

A. They enter into that calculation.

Mr. Mason: Have you any questions on the exhibit, Mr. [fol. 2257] Strouss?

Mr. Strouss: I notice this only covers a period from 1930 to 1939 while most of your other exhibits go from 1922 to 1939. Was there any particular reason for that?

A. Yes, prior to 1930 our abandonments were not very extensive.

The Court: Speak a little louder, please.

A. I say, prior to 1930 we didn't abandon very many lines. Our activities in respect to abandonment of unprofitable lines in the interest of economy really date from 1930.

Mr. Mason: We offer the exhibit in evidence as No. 171.

Mr. Strouss: I object to it as irrelevant and immaterial.

The Court: Objection overruled, it may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 171.")

Mr. Mason: Mr. Masson, I direct your attention to an exhibit in sixteen sheets the title of which is "Net Railway Operating Income and Rate of Return on Investment (Book Value), Calendar Years 1925 to 1939, Inclusive." Have you that statement before you?

[fol. 2258] A. Yes, sir.

Mr. Mason: We ask that this be marked for identification, defendant's exhibit No. 172?

The Court: It may be marked.

The Clerk: Defendant's exhibit No. 172 for identification.

Mr. Mason: Referring to the first sheet of the exhibit No. 172 for identification, was the exhibit in its entirety prepared by you or under your direction?

A. It was prepared under my supervision and direction.

Q. As to the first sheet, from what sources were the figures on that sheet taken?

A. The items 1 to 12, inclusive, were taken from the monthly reports of revenue and expenses rendered by the Pacific lines to the Interstate Commerce Commission. We have those reports in the courtroom.

Q. And the territory covered by the exhibit, that is the lines to which the exhibit relates, are the lines west of El Paso, Tucumcari, and Ogden and south of Portland which you have heretofore identified as the Pacific lines?

A. Yes.

Q. Does this include all main and branch line operation [fol. 2259] of that property?

A. Yes.

Q. It relates only to its carrier operations, as I understand it?

A. Yes.

Q. These revenues are only those which are derived from operation as a railroad?

A. Yes.

Q. Apart from any hotel or lumber company or oil property operations, is that correct?

A. That is correct?

Q. From what sources do you obtain the figures in line 14?

A. Fourteen is taken from the annual report and other sources that are explained on sheet 2 to 16?

Q. Is the figure for the year 1925 found in line 14 explained in detail on sheet 2 of the exhibit?

A. Yes.

Q. Then the figures in line 15, how are they arrived at?

A. That is the quotient of a division of the item of revenue, item 12, by item 14.

Q. For instance, as to the year 1925, you divide a figure shown opposite line 12, net railway operating income, by figures shown opposite line 14, book value at close of year, [fol. 2260] and obtain the percentage figure in line 15?

A. Yes.

Q. And the same for each of the other figures in line 15?

A. Yes.

Q. Going to sheet 2, I will ask you first if your explanation of sheet 2 is generally applicable to the succeeding sheets, 3 to 16, inclusive?

A. Yes, this was arranged so that anyone can follow the figures from the reports that are stated at the bottom of the sheet, the annual report to the Interstate Commerce Commission, the stockholders' reports, and the balance sheets are all here in court. That was prepared primarily to indicate and show the court what makes up the Pacific

lines of the Southern Pacific Company and to assist the attorney for the opposition in tracing the figures through.

Q. Let's go further into sheet No. 2, first referring to line 1, you show the name of "Southern Pacific Company." Do I understand that the annual report to the Interstate Commerce Commission or the annual report to the stockholders show that as of the end of 1925 it had a total investment in road and equipment as indicated in column C, line 1?

[fol. 2261] A. Yes.

Q. And that figure is further broken down into a total investment in the railroad properties known as the Pacific lines as indicated in column D?

A. Not that figure, no, but added to that figure are the investments in other lines that comprise the Pacific lines.

Q. The Southern Pacific Company as a corporation had invested in Pacific lines the fiure shown in line 1, column D?

A. Yes.

Q. And that same corporation as a corporation and considered not as a railroad for the moment, had an investment elsewhere of the figure shown in column E, is that correct?

A. Yes.

Q. You have explained column E by a footnote reference?

A. Yes.

Q. Does the addition of columns D and E for line 1 appear in some other column on the exhibit?

A. Column C.

Q. Columns D and E are the breakdown of column C?

A. Yes.

[fol. 2262] Q. In line 2 you refer to the name of the corporation, Alamogordo and Sacramento Mountain Railway Company. What is that company or what was it?

A. That was a wholly owned subsidiary of the Southern Pacific Company.

Q. Did it as a corporation own certain fixed property or equipment as of the end of the year 1925?

A. The amount shown in line 2, columns C and D.

Q. What was the Arizona Eastern as of December 31, 1925?

A. A wholly owned subsidiary of the Southern Pacific Company owning fixed property as shown in columns C and

D which were operated under lease by the Southern Pacific Company.

Q. What as to the rest of these companies shown in lines 4 to 21?

A. The same explanation applies to each and every one of them. In other words, all of these companies shown from line 2 to line 21 represent wholly owned subsidiaries of the Southern Pacific Company owning property with a book value as shown in columns C and D, whose properties are operated under lease by the Southern Pacific Company. The exception to that is the Inter-California Railway Com- [fol. 2263] pany which owns property both in the United States and in Mexico and only the lines in the United States are operated under lease by the Southern Pacific Company as part of the Pacific lines.

Q. Are the lines of the Inter-California Railway Company in Mexico indicated on exhibit No. 1?

A. I can't see from here, but I think they are.

Q. These lines between Mexicali and Lower California and Algodones in Lower California, both points being on the international boundary line?

A. Yes.

[fol. 2264] Q. Now, passing from Account 701, Investment in Road and Equipment, what is the explanation as to Account 702, Improvements on Leased Railway Property?

A. Those were expenditures made by the operating company on property leased by it, expenditures representing additions and betterments to leased properties.

Q. Now, as to Account 708, what does that represent?

A. That is actual cash.

Q. Apparently none of these subsidiaries had any money, is that correct?

A. No, they are dormant corporations so far as operations are concerned; their properties are operated by the Southern Pacific Company and the Southern Pacific Company pays all of their corporate expenses; therefore, they have no cash on hand.

Q. And what is Account 716?

A. Material and Supplies, an operating stock of materials and supplies.

Q. Would that be such stock as spare ties awaiting insertion in the track?

A. That includes everything of an operating nature: rails, ties, locomotive parts, bridge parts, in fact, all types [fol. 2265] of material used in the operation and repair of a railroad.

Q. Would it include fuel oil on hand in the company's possession?

A. Yes.

Q. Would it include locomotives and cars?

A. No.

Q. Where are they included?

A. They are included in Column C, they are in the investment account.

Q. Would they also appear in Column D?

A. Column D, yes.

Q. I notice that when we get over to Sheet 16, and I think it is true of some of the intervening sheets, that instead of having the number of company lines 2 to 21, inclusive, that the number has been reduced so that you have only eight other than the Southern Pacific Company. What has happened to the rest that are not shown?

A. The others have been consolidated. Through the period of years covered by this exhibit it has been the aim of the company to simplify its corporate structure, and in that process if has transferred the properties of one company to another and disincorporated that company, and, in other words, it has reduced the number of corporate entities owning the railroads.

[fol. 2266] Q. Does that account for this disappearance of the South Pacific Coast Railroad Company, for example?

A. Yes; the South Pacific Coast Railroad Company was acquired by the Southern Pacific Company.

Q. What has happened to the Inter-California; what has become of its United States properties?

A. The line in the United States were acquired by the Southern Pacific Company, and the lines in Mexico are operated independently.

The Court: Well, Mr. Masson, the Court is a little confused on your corporate structure here. The defendant in this case, I take it, is the Southern Pacific Company.

A. Yes, sir.

Q. Now, referring to Sheet 2, on Line 1, you list there the Southern Pacific Company; down on Line 20 you have the Southern Pacific Railroad Company, and then the over-

all designation of the entire exhibit is the Southern Pacific Company.

A. Pacific Lines.

Q. Pacific Lines? It doesn't so state.

Mr. Mason: No, the Southern Pacific Company.

The Court: (Continuing) Now, having in mind that the whole is no larger than its component parts, why do you [fol. 2267] list the Southern Pacific Company on Line 1 if the Southern Pacific Company actually owns all the subsidiaries shown there between lines 1 and 20?

A. The Southern Pacific Company owns certain railway properties which are part but not all of the Pacific Lines. The remaining lines that are operated as the Pacific Lines are owned by these respective subsidiary companies. The investment of these separate organizations is kept separate in our accounts. To determine the full investment value of all Pacific Lines, we must naturally go to the books of each company that makes up those lines. That is why it is shown. There is no duplication in these figures, nor is there, you might say, any relationship except through the instrumentality of a lease, first, of these properties by the Southern Pacific Company and, next, the stock ownership by the Southern Pacific Company of these various subsidiaries. Is that clear?

Mr. Mason: Do I understand, Mr. Masson, that the Southern Pacific Company owns the entire stock of each of these subsidiaries which, for the year 1939, are shown on Sheet 16 in Lines 2 to 9, inclusive?

A. Yes.

[fol. 2268] Q. And has caused them to lease all of their physical properties to the Southern Pacific Company?

A. Yes.

Q. Does the Southern Pacific Company control the amount of investment, the betterment which may be made on any of these leased properties?

A. Yes, it does.

Q. Through its stock ownership?

A. Yes.

Q. And the entire property, owned and leased, then is what constitutes the Southern Pacific Company, Pacific Lines, railroad system?

A. Yes.

The Court: I still don't understand why—take Sheet 16, why you list the Southern Pacific Company on Line 1, then set up in the various schedules there the financial structure, when you have just testified that all of these lines are owned and controlled by the Southern Pacific, and your exhibit shows that the Southern Pacific Company, being the same company, I take it, that is listed on Line 1, actually owns the whole. Maybe I don't make myself clear.

A. Yes, I think I understand. First, let us make a distinction of ownership. The Southern Pacific Company [fol. 2269] owns the stock of all of these subsidiaries. We have shown here the book value of the investment of the Pacific Lines, the investment in road and equipment, physical properties. In arriving at that figure we cannot take the value of the stock that is owned by the Southern Pacific Company; we must take the value of the properties used by the Southern Pacific Company. Now, the value of these properties used by the Southern Pacific Company is not on the books of the Southern Pacific Company; only the stock value is on the books of the Southern Pacific Company. Therefore, when we make a consolidated investment figure we must go to the books, first, of the Southern Pacific Company, where we will find only the value of a small part of the Pacific Lines; then we must go to the books of each one of these other subsidiaries to get the total value invested in the physical properties that is separate and apart from the stock ownership of these companies.

Mr. Mason: Now, may I ask some questions in that connection, and they may be leading, Mr. Strouss, but I think they will develop the points we have in mind.

Q. Do I understand, Mr. Masson, referring to Sheet 16, Line 2, that the Arizona Eastern Railroad Company is a [fol. 2270] corporation separate from the Southern Pacific Company?

A. It is.

Q. And it holds legal title to certain property having an investment value as indicated in Column D, Line 2?

A. Yes.

Q. That property is then leased under a long-term lease to the Southern Pacific Company?

A. Yes.

Q. Which latter then operates it as part of a railroad system.

A. Yes.

Q. Now, the Southern Pacific Railroad Company is a corporation separately organized apart from the Southern Pacific Company?

A. Yes.

Q. Chartered in Arizona, as a matter of fact, isn't it?

A. Yes.

Q. And it owns legal title to certain properties?

A. Yes.

Q. Which are leased for a long period of years to the Southern Pacific Company, the so-called parent company? [fol. 2271] A. That is correct.

Q. And the same as to each of these other properties in lines 3 to 8, inclusive?

A. Yes.

The Court: Of course, the parent company not only leases it, but owns the capital stock of the subsidiary corporation.

A. They own the stock, yes, but that doesn't give them authority to operate the property.

Mr. Mason: Referring to Line 1 on Sheet 16, and comparing the figure in Column D, line 1, with the figure in Column D, Line 10, is the figure in Line 1, Column D, the investment value of the properties to which the Southern Pacific Company as the corporation—the physical properties to which that company as a corporation holds legal title?

A. Yes.

Mr. Mason: Does that make it clear, your Honor?

The Court: I think I see it. One other question: The Southern Pacific Company, the parent organization, so-called, must be distinguished from this Southern Pacific Railroad Company down here on Line 9?

A. Yes.

[fol. 2272] Q. That is an entirely separate corporation?

A. Two different corporations.

Mr. Mason: Mr. Masson, just as a matter of explanation, why are these corporations or some of them kept alive while others are discontinued; do you know?

A. Mostly because of outstanding mortgages and bond issues, bond issues outstanding.

Q. Now, these figures in Line 14 correspond to the figures shown in Column D, Line 10, of each of these succeeding pages, do they?

A. Yes.

Q. Where are they found?

A. Well, the figure—take 1939, the figure in the last column opposite Line 14 on Sheet 1 is the same figure as will be found in the last column on Sheet 16.

Q. Column O?

A. Column O.

Q. Being the total investment, including cash, material and supplies.

A. Yes, sir.

Q. That is investment in fixed property, cash on hand.

A. What is ordinarily known as working capital, consisting of material and supplies, and cash.

[fol. 2273] Q. Do I understand then each of the sheets 2 to 16, inclusive, is a break-down of the investment figure of line 14 in Sheet No. 1?

A. Correct.

Mr. Mason: Have you any questions on the exhibit?

Mr. Strouss: We are about to adjourn. I would like to look this over tonight.

Mr. Mason: Would you prefer that I defer the offer until tomorrow morning?

Mr. Strouss: Yes, I would.

The Court: The court will be at recess until ten o'clock tomorrow morning.

(Thereupon, the court stood at recess until Wednesday, January 15, 1941, at ten o'clock A. M.)

[fol. 2274] January 15, 1941, ten o'clock A. M.

Proceedings were resumed at this time as follows:

Mr. Mason: Mr. Strouss, have you before you the transcript of yesterday's testimony?

Mr. Strouss: Yes.

Mr. Mason: Page 2189. Mr. Masson has called my attention to his answer in line 23 to a question which you addressed to him in connection with exhibit No. 162. His answer

was "No," and the question was, "On Item 1 you have an increase of mileage of road operated?" Now, obviously, the answer should have been yes. He says he clearly didn't understand the question.

The Court: You are asking permission, then, to change the answer?

Mr. Mason: I think the answer should be changed to "Yes," if you care to stipulate to that.

Mr. Strouss: Sure, I will stipulate to that. I didn't notice that in his answer to the question that he said "No."

The Court: The correction indicated, then, may be made.

Mr. Mason: Now, I think that we had about finished preliminary questions prior to an offer of the exhibit [fol. 2275] marked "Exhibit No. 172 for identification," but at the conclusion I withheld the offer because Mr. Strouss indicated that he desired to ask some questions, or, rather, preferred to look the exhibit over before the offer was made.

L. J. Masson was recalled to the stand, and testified further as follows:

Mr. Strouss: Mr. Masson, Item 14, book value at the close of the year, that is not the same valuation that Mr. Baker testified to?

A. No.

Q. Those were exhibits 111, 112, 113, and 114?

A. No, that is the book value, the value that we carry on our books. Mr. Baker's value is the valuation of the I. C. C. brought down to date.

Q. Now, in Item 10, Railway Operating Income, of course, rent paid to subsidiaries for lease of properties wouldn't be included in that item?

A. No.

Mr. Strouss: That is all.

Direct examination (Continued).

By Mr. Mason:

Q. As I understand, Item 10, Mr. Masson, is the income [fol. 2276] as indicated by the item shown of the properties taken altogether and operated as a railroad?

A. Yes.

Q. Regardless of the bare legal title being in one corporation or another?

A. Yes.

Q. Are all the underlying documents used in connection with this exhibit available for the examination of opposing counsel, if necessary?

A. Yes.

Mr. Mason: Has the Court any questions on the exhibit?

The Court: I think not.

Mr. Mason: We offer the exhibit in evidence as No. 172.

Mr. Strouss: Objected to as irrelevant and immaterial.

The Court: The objection is overruled. It may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 172.")

Mr. Mason: Will you refer, please, Mr. Masson, to a statement in one sheet entitled "Southern Pacific Transportation System, Income Account for the Calendar Years 1925 to 1939, Inclusive?"

[fol. 2277] A. Yes, sir.

Mr. Mason: May we have that statement marked 173 for identification?

The Court: It may be marked.

The Clerk: Defendant's Exhibit No. 173 for identification.

Mr. Mason: Did you prepare this statement, No. 173 for identification, or cause it to be prepared?

A. I caused it to be prepared, and it was prepared under my supervision and direction.

Q. And from what sources?

A. From the annual reports of the Southern Pacific Company to its stockholders.

Q. Are copies of the annual reports to the stockholders also furnished to the Interstate Commerce Commission?

A. Yes.

Q. Is the annual report to the stockholders maintained as a permanent company record?

A. Yes.

Q. Do you have copies of the annual reports for these years here for the use of opposing counsel?

A. Yes.

Q. Now, will you state just which lines are included in [fol. 2278] the transportation system as that title is used at the heading of the exhibit?

A. As shown in the heading of the exhibit, the transportation system of the Southern Pacific Company includes the Pacific Lines, the Southern Pacific Steamship Lines——

Q. Between which points do the steamship lines operate?

A. Between New York, New Bedford, Boston, Norfolk, New Orleans, Galveston and Houston; and also includes the Texas and New Orleans Railroad Lines running from New Orleans to El Paso.

[fol. 2279] Mr. Mason:

Q. The Texas and New Orleans Railroad is a railroad property?

A. Yes, it is a wholly owned railroad company operated independently.

Q. What is the relation between the Southern Pacific Company and the Texas and New Orleans Railroad Company from the standpoint of stock ownership?

A. A wholly owned subsidiary of the Southern Pacific Company. In other words, the Southern Pacific Company owns the entire outstanding capital stock of the Texas and New Orleans Railroad.

Q. Does the Texas and New Orleans maintain its own headquarters?

A. At Houston, Texas.

Q. Taking the year 1925, you show first a block of items entitled "Operating Income." What type of income is indicated by the figures in line 7?

A. That is the net railway operating income, or, in other words, the net revenue derived from transportation.

Q. Is that sometimes referred to as income from carrier operations?

A. Yes.

Q. What does line 1 purport to show?

[fol. 2280] A. Line 1 is the total railway operating revenues from transportation of freight and passengers and other miscellaneous revenues incident to the transportation business.

The Court: That is a gross figure?

A. Yes.

Mr. Mason: Line 2 is what?

A. Railway operating expenses incurred in connection with the transportation service rendered in earning the gross revenues.

Q. What does line 3 represent?

A. Line 3 represents the revenue or the difference between the gross revenue and the operating expense.

Q. Is line 3 the subtraction of item 2 from item 1?

A. Yes.

Q. What is item 4?

A. Item 4 are the railway tax accruals.

Q. Does that include state as well as Federal tax payments?

A. Yes.

Q. Do those include taxes on any properties other than those used in conducting transportation operation?

A. No.

[fol. 2281] Q. If there are income taxes or sales taxes not based upon property valuations, are those included in item 4?

A. Yes, if they are applicable to the companies included in this exhibit.

Q. What does item 5 represent?

A. Item 5 represents freight or passenger charges that were uncollectible from consignees.

Q. Are those amounts which were earned but not collected?

A. Earned but not collected is correct.

The Court: I thought the railroads collected in advance. How did that happen?

A. We don't always do that. We would like to, your Honor, but we have two classes of charges. A consignor may wish to pay the freight and we call that "prepaid freight." In the majority of cases charges are always collected at destination.

Q. Do you surrender the freight before collecting your charges?

A. We do not unless the consignee is protected by bond, but it so happens at times that at the time of delivery all charges may not be apparent, and in many cases there will be additional charges come along for one reason or another, the application of the wrong rate or a correction in the [fol. 2282] weight or some charge that may have accrued

enroute will come along later and we will find it rather difficult and sometimes impossible to collect those charges.

Q. The railroad company experiences difficulty with bad debts the same as many other businesses.

A. Your Honor, we are no different than the corner merchant, we have the same problems that he has except that they are more widely dispersed.

Mr. Mason: I will ask you, Mr. Masson, if it is not a fact that the amounts which go to make up uncollectible railway revenues are frequently very small in amount?

A. That is true.

Q. Not justifying the expense of collection in many cases?

A. That is true. We are obligated under the law to exhaust every possible means to collect our charges, even going to court, but many of the items are so small that it is not worth while.

The Court: The cost of collection would exceed the debt?

A. Yes. We are not expected to do an idle or an expensive act.

Mr. Mason: As to item 6, what does that represent?

[fol. 2283] A. That represents equipment and joint facility rentals. That is the per diem we pay. That is the net of the per diem or car rental that we pay other lines or collect from other lines for the use of our cars.

Q. Do those represent the balances by which the amount paid to other lines exceeds the amount received?

A. Yes, the joint facility rents represent the rentals that are paid for use of joint properties, properties owned by other lines which we use jointly with them.

The Court: Pardon me, Mr. Masson, reverting for the moment to the item, "Uncollectible Railway Revenues," evidently you must have improved your system as I notice for the years 1936, 1937, 1938, and 1939 no such items appear?

A. We were not any more fortunate in those years than we were in the past, but due to a change in the instructions issued by the Interstate Commerce Commission that account, uncollectible revenue, was canceled and we now

charge the uncollectible revenues against freight revenue or passenger revenue as the case may be.

Q. It is just a matter of bookkeeping then?

A. Just a matter of bookkeeping.

[fol. 2284] Q. You still sustain your losses?

A. We do, yes, sir.

Mr. Mason: I take it in these later years you simply do not show quite as much in item 1 as you otherwise would?

A. That is right.

Q. To illustrate equipment rents, if a Southern Pacific Company car is on the lines of the Santa Fe, does the Southern Pacific receive rental from the Santa Fe?

A. Yes.

Q. At an agreed rate?

A. A dollar per day.

Q. If the Santa Fe car is on the Southern Pacific lines, does the Southern Pacific Company pay rent for the car while it is on the lines?

A. Yes, at the same rate.

Q. And the same, of course, with every other railroad with which equipment is interchanged?

A. That is true.

Q. I take it that this item, No. 6, is largely made up of the balancing of these cross-accounts?

A. Yes.

Q. If the Southern Pacific participates jointly with other railroads at a terminal such as the Los Angeles union pas-[fol. 2285] senger terminal, is rental paid for the use of that terminal?

A. Yes.

Q. Does that enter into this item of joint facility rents?

A. Yes. I want to explain when I said a dollar per day I was speaking of freight cars.

Q. I understand there are different rental figures for different kinds of equipment of different ownership?

A. Yes.

Q. In obtaining your figure in item 7, will you explain what relation that bears to item 3 and how item 3 is reduced, if it is, in obtaining item 7?

A. Item 3 is the net remaining after applying operating expenses, that is, the cost of maintenance of way and equipment, traffic expenses, transportation expenses, general expenses. After applying that cost against the gross revenue,

we have item 3. Of this net remaining from transportation we have taxes to pay. That is a charge against the amounts shown in line 3. So also are uncollectible revenues and so also are equipment and joint facility rents. The sum of lines 4, 5, and 6 is deducted from line 3 to get line 7. Does that make it clear?

Q. Yes, I think it does. Proceeding now to the block of [fol. 2286] items entitled "Other Income," what is represented there?

A. Other income are items that are distinguished from operating revenues or expenses and are generally of a financial nature. They will include revenues from miscellaneous operations; income from lease of road and equipment; miscellaneous rent income, that is, rent that we collect from property in and around our rights of way.

Q. Would that, for example, include rentals from property leased to private persons for warehouse sites?

A. Yes.

Q. Would this other income include dividends on stock which the company may own?

A. Yes, I was coming to that.

Q. Would it include interest on bonds which the company may own?

A. Yes, income from securities the company may own.

Q. Would it include interest on bank deposits?

A. Yes, if we get any.

Q. Suppose that the company owns lands which produce oil or other minerals, where does the income appear?

A. That would go into "Other Income."

[fol. 2287] The Court: That is line 9?

A. Yes, sir.

Mr. Mason: How do you get line 11?

A. Line 11 is the addition of line 10 to line 7 which brings us to a figure of gross income, that is, receipts from all sources.

Q. I understand that this figure in line 11 is the corporate income of the transportation system?

A. Yes, the gross corporate income of the transportation system.

Q. That includes both operating and non-operating income?

A. Both operating and non-operating income.

Q. What items are placed in the next block which includes lines 12 to 16?

A. We have charges that would go against income items that are credited to other income, such as taxes on miscellaneous operating property; miscellaneous rents of one kind or another; miscellaneous tax accruals; tax accruals that apply to properties that are not strictly operating properties. We have other items such as the maintenance of an investment organization, an organization that looks after our investment securities and minor items of that kind.

Q. Would it be correct to say that this group, miscellane-
[fol. 2288] ous deductions from income, are the expenses and deductions associated with the non-carrier operations which yield the non-carrier income?

A. That is essentially correct.

[fol. 2289] Q. Now, what do you place in the block entitled "Fixed Charges," items 17 to 20?

A. Well, fixed charges include, first of all, interest on outstanding debts, funded debt or any indebtedness that the company may have.

Q. What do you mean by "funded debt?"

A. Funded debt is a debt that has been covered by securities and mortgages.

Q. Well, then, this item 17 represents essentially bond interest or interest on secured notes, does it?

A. It does, yes, sir.

The Court: While on that, Mr. Masson, I notice that between the years 1927 and 1939, there has been quite a substantial increase in spite of the fact that the interest rates have dropped. Now, does that mean that the company has increased its indebtedness during that period materially?

A. It does, yes, sir. When you say that interest has dropped——

The Court: I was taking that from the commercial world generally.

The Witness: (Continuing) We must bear in mind that the fixed obligations that have been outstanding for some time carry the same coupon interest today as they did several years ago, but besides that we had to increase our
[fol. 2290] indebtedness considerably. We borrowed from

the R. F. C.-Reconstruction Finance Corporation, and we also borrowed from the banks. We now owe each of those generous individuals eighteen million dollars apiece, so that is quite a sum outstanding.

Mr. Mason: And is there interest payable on these added borrowings that you have mentioned?

A. Yes.

Q. Does that enter into Item 17, the interest on funded debt, bonds and notes?

A. Yes, sir.

Q. You spoke of other fixed charges. Does that represent sinking fund payments?

A. No, it doesn't represent sinking fund payments; it represents, primarily, rents for leased road and equipment and amortization charges.

Q. Amortization charges on what type of obligation?

A. Well—I beg your pardon, there is no such item in that. You based your questions on 1925. I was following the 1939 report. I said there is no amortization, which is a fact, so far as 1939 is concerned. There happened to have been charges for "Amortization of discount on funded debt in years 1925 to 1938 inclusive". Whilst amortization charges is a part of fixed charges, we happen to have no [fol. 2291] charges of that kind in here, but the other fixed charges does represent, as I say, rent for leased road and equipment, and then interest on unfunded debts.

Q. When you speak of interest on unfunded debt, is that such matters as short term loans?

A. Yes, of one kind and another.

Q. Mr. Masson, you are familiar with the type of security or obligation sometimes called an equipment trust note?

A. Yes.

Q. For what purpose are equipment trust issues used?

A. Well, for the purchase of equipment.

Q. Do they become funded debts of the company?

A. Yes.

Q. Do they carry interest?

A. Yes.

Q. And where such interest is paid, in what item would it appear?

A. Interest on funded debt.

Q. Is it line 17 here?

A. Yes.

Q. How did you arrive at the figure on Line 20—

The Court: Mr. Mason, I don't think it will be necessary to go into that. It is quite evident from the exhibit itself.

[fol. 2292] Mr. Mason: Very well. Is it desirable to explain line 21? I imagine it is not, because it is shown by the division of line 16 by 19 on the face of the exhibit.

Q. Has the exhibit been compared against the original sources, Mr. Masson?

A. Yes.

Q. And are there any computations hereon which do not appear on the original sources?

A. The line 21 is a computation which indicates the number of times fixed charges were earned, as indicated there in dividing line 16 by 19.

Q. Mr. Masson, is a showing of this character prepared for the Southern Pacific Company, Pacific Lines, apart from the balance of the transportation system?

A. No.

Q. Could such a showing be prepared from the books of the company?

A. No.

Q. Could such a showing be prepared for the Texas and New Orleans Railroad Company considered as a unit and apart from the balance of the transportation system?

A. Yes.

[fol. 2293] The Court: I take it, from this exhibit, referring to line 22, that no dividends have been declared since the year 1932?

A. That is true, and if we don't do any better in the future we are going to be in the soup.

Mr. Strouss: I move that that be stricken.

The Court: Yes, that may be stricken.

Mr. Mason: Could a showing of this kind be prepared for the Southern Pacific Steamship Lines apart from the other two units shown here?

A. No.

Q. Will you state why you have prepared and presented the exhibit in this fashion showing the entire transportation system rather than for the Southern Pacific Company, Pacific Lines, as a separate unit?

A. The purpose of this exhibit primarily is to show the reduced earning power of the Southern Pacific Transportation System, on which the Southern Pacific Company's outstanding stock must depend for dividends. That is the reason why the exhibit was prepared in this form, to show the availability of earnings and the earnings power, as a matter of fact, that is behind the Southern Pacific Company stock now outstanding.

[fol. 2294] The Court: Well, Mr. Masson, in examining the exhibit, if I read it correctly, in spite of the fact that no dividends have been declared since 1932, it does appear from the exhibit, does it not, that there has only been three years during the period 1925 to 1939, inclusive, where there has actually been a net deficit?

A. That is so, too, yes, sir. May I point out, however, that in many of the other years there was very little left for dividend purposes.

Mr. Mason: Have you any questions on the exhibit, Mr. Strouss?

Mr. Strouss: Not at the present time, no.

Mr. Mason: Has the Court any further questions?

The Court: I think not.

Mr. Mason: We offer the exhibit in evidence as No. 173.

Mr. Strouss: Objected to as irrelevant and immaterial.

The Court: Overrule the objection. It may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 173.")

Mr. Mason: Will you refer, please, Mr. Masson, to a [fol. 2295] statement in one sheet entitled "Summary of Authorizations Granted by Interstate Commerce Commission Under Section 20A of Interstate Commerce Act?"

A. Yes, sir.

Mr. Mason: May we have this statement marked 174 for identification?

The Court: It may be marked.

The Clerk: Defendant's Exhibit No. 174 for identification.

Mr. Mason: Did you prepare Exhibit No. 174 for identification?

A. Yes, sir, I prepared it personally.

Q. I will ask you to refer, if you will, to Mr. Russell's Exhibit No. 7, Defendant's Exhibit No. 7, which was presented on the first day of this trial.

A. Yes, sir.

Q. And also refer to Mr. Russell's testimony, his answer to a question with respect to the equipment trust obligations, which were apparently referred to under column K of his exhibit No. 7, headed "Trust Series." Did you prepare exhibit No. 174 for identification with reference to Mr. Russell's exhibit No. 7?

A. Yes.

[fol. 2296] Q. In what manner was it prepared?

The Court: Did I understand you to say No. 7, Mr. Mason?

Mr. Mason: Yes.

The Court: That has to do with locomotives purchased or built in company shops, does it not?

Mr. Mason: Purchased or built in company shops, yes, and this will relate to the purchase.

Q. Will you explain just how you prepared Exhibit 174 for identification with reference to exhibit No. 7?

A. First I referred to the trust agreements and there found the equipment as listed in Mr. Russell's exhibit No. 7. Then I referred to the orders of the Commission issued in each of these cases.

Q. Did you refer to the letter series shown on exhibit No. 7 as the indication of the various series of trust indentures that were shown as having been issued?

A. Yes.

The Court: That is column K?

Mr. Mason: Yes.

The Witness: (Continuing) And having reviewed the orders of the Commission, I abstracted column C and column D, the information shown in those columns, then I [fol. 2297] went to the published reports and abstracted the references that are shown in column E.

Mr. Mason: I think Your Honor will recall that Mr. Russell, in answer to my question asking him whether these various trust indentures or trust series shown by letter on his exhibit had been authorized by the Commission, said, "I understand that may have been," which answer was ob-

jected to as being hearsay. The purpose of exhibit 174 is to show, by calling to the Court's notice, by the Interstate Commerce Commission's published reports and orders, the fact in that connection.

Q. Were you able, by associating the letter series with the date and the finance docket number, to obtain the Interstate Commerce Commission orders and dates of issuance in connection with each of these letter series of these trust indentures?

A. Yes.

Q. Have you compared the exhibit against the Interstate Commerce Commission report?

A. I abstracted it personally from those reports.

Q. And you know it to be a true and correct reflection? [fol. 2298] A. Absolutely.

The Court: Well, do I understand, Mr. Masson, that the Southern Pacific Company cannot issue these trust indentures without the approval of the Interstate Commerce Commission?

A. That is correct; under section 20A, the I. C. C. has jurisdiction over all securities that any company might intend to issue.

Mr. Mason: You are referring to Section 20A of the Interstate Commerce Act?

A. Yes, sir.

Mr. Mason: I think that is now Section 20A of Part 1, of the Transportation Act of 1940, is it not, Mr. Strouss?

Mr. Strouss: I think so.

Mr. Mason: Have you any questions on No. 174, Mr. Strouss?

Mr. Strouss: No questions.

Mr. Mason: We offer exhibit No. 174 in evidence.

Mr. Strouss: No objection.

The Court: It may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 174.")

Mr. Mason: I think that is all we have from Mr. Masson [fol. 2299] now, Mr. Strouss, if you wish to cross-examine.

Cross-examination.

By Mr. Strouss:

Q. Mr. Masson, the operation of branches has considerable bearing upon operating expenses of the division, does it not

A. Yes.

Q. And where the branch-line operations are in a territory that presents difficulties in operation such as severe grades and other things of that sort, that would tend to increase operating costs; that, of course, would also tend to increase operating costs on the division as a whole where you are calculating costs including both main line and branch service?

A. It would have a contributing effect, of course, on the cost.

Q. Do you segregate in your accounting system costs of operation for branch-line operations and for main-line operations?

A. Only as to maintenance of way.

Q. Prior to the year 1931 you did segregate those costs, operating costs as to branch and main-line operations, did you not?

[fol. 2300] A. Yes.

Q. Now, you have considerably more branch line operation in Arizona than you have in Nevada; isn't that true?

A. Yes.

Q. I think your exhibit 115 shows branch-line track in Nevada 153.60?

A. That is correct.

Q. Arizona, 464.96?

A. That is correct.

The Court: What exhibit was that, Mr. Strouss?

Mr. Strouss: 115.

Q. Now, your form 521 for the year 1931 shows your branch-line operations on the Tucson division at $1.305; on the branch line operations on the Salt Lake Division, 88.4 cents.

A. I haven't that form 521—1931?

Q. 1931.

A. I haven't that here. Can you suspend that question for a minute until I get that

Mr. Strouss: Yes, you may check that figure later.

The Court: We will take a recess at this time if you want to suspend while he gets that.

Mr. Strouss: Have you those here?

A. Yes, we have them here.

[fol. 2301] The Court: Very well. We will take a recess.

(Thereupon, a short recess was taken, after which the witness was recalled to the stand, and proceedings were resumed as follows:)

[fol. 2302] Mr. Strouss: Q. I am speaking of the cost per train-mile, Mr. Masson. For the year 1931, main line, Salt Lake division, the total was $1.047?

A. That is correct.

Q. And Tucson, $1.11?

A. That is correct.

Q. Branch lines, Salt Lake, $0.884?

A. That is true.

Q. Tucson, $1.305?

A. That is true.

Q. In 1930 on the Salt Lake division, main line, $1.062?

A. Correct.

Q. Branch lines, $0.904?

A. Correct.

Q. On the Tucson division, $1.13 for main lines?

A. The 521 that I have here for 1930 is not complete as to the year. What figure did you quote?

Q. $1.13 for main line.

A. I can't verify that figure because the form I have here doesn't show that. That is the year in which the limits of the division were changed.

Q. I think I took that off of your 1931—no, that wouldn't show in your 1931 recapitulation.

A. No, unless you computed it. What was the other [fol. 2303] figure?

Q. Branch lines, $1.392?

A. The cost on the Tucson division—I can't verify that.

Q. There are a great many items, of course, that enter into cost of operation, are there not, or that affect the cost of operation?

A. You mean train operation?

Q. Train operation, yes. For example, the number of tracks will have its effect upon costs?

A. As to whether or not there is sufficient track room for the trains that are operated?

Q. Single or double track, the costs may be affected by whether your operation is on single or double track?

A. Yes.

Q. Also the volume of traffic will have its effect upon costs?

A. The volume of traffic that can be put in one train.

Q. Volume of traffic available?

A. It will, yes, to a certain extent if the traffic is not enough to fill out the trains.

Q. Length of divisions or operating districts will have its effect upon costs?

A. I don't think that would have an material effect on [fol. 2304] costs.

Q. If you have a train, a freight train district where the operation of the freight train is for one hundred miles and another district of two hundred miles before there is a change of engines, wouldn't that longer division have a less cost, for example, in the cost of the preparation of the engine for its run?

Mr. Mason: I would like to have that question read.

(The question was read by the reporter.)

Mr. Mason: Your Honor, I don't think I have qualified the witness to testify regarding details of operation, and I don't believe that he undertook to so qualify himself. The exhibits that he presented are largely excerpts from statistical reports or statistical compilations and indicate the result of his research into those accounts rather than his own opinion as to how costs can be affected. I doubt that this can be properly considered as proper cross-examination and I object to the question as improper cross-examination.

The Court: If the witness can answer the question, he may do so, and if he doesn't know he may so state.

A. I would rather not express an opinion on that because [fol. 2305] I am really not expert at it.

Mr. Strouss: Different wage scales in different divisions would, of course, affect the cost?

A. Yes.

Q. Different fuel costs?

A. Fuel is about the same cost over the entire system.

Q. There would be a transportation charge in addition to the original cost which would be chargeable to the division, would there not?

A. We have an average price over all the system.

Q. You don't charge each division for the cost plus the transportation of the fuel to that division?

A. No.

Q. So that availability of the fuel to the division would not affect the cost then?

A. No.

Q. There would be an effect so far as fuel is concerned on the amount of locomotive miles on the division for helper service, would there not?

Mr. Mason: What is that question?

(The question was read by the reporter.)

Mr. Strouss: In other words, a helper engine requires fuel and that fuel cost adds to the cost of operation chargeable to that division?

[fol. 2306]

A. The more engine miles the more consumption.

Q. And the same would be true of wages for the engine crew in helper service?

A. Yes.

Q. And the same would be true of switching on the division?

A. Yes.

Q. And the availability of water would be a matter to be considered in that cost, that is, the cost of water by reason of its availability to the division?

A. I don't think that would affect it to any material extent.

Q. What about locomotive supplies, the availability of the market for the purchase of locomotive supplies?

A. That wouldn't have any effect.

Q. What about the difference in the percentage of empties to loads upon the different divisions?

A. That would have some effect, yes.

Q. It would have a material effect with respect to gross ton-miles, would it not?

A. Cost per gross ton-mile, of course the more empties you have to haul over the division the more trains you have to run.

[fol. 2307] Q. And the greater your gross ton-mile cost?

A. The greater the gross ton-mile cost.

Mr. Mason: Q. Would that increase the gross ton-mile cost because they were empties instead of loaded?

A. Not the unit cost, no.

Mr. Mason: I think that was the question and I wanted to be sure the answer was correct.

Mr. Strouss: I notice you have given the revenue for the different states and the operating revenue and the operating costs. It is a fact, isn't it, that over the same period covered by your exhibit here that the operating ratio, the trend so far as operating ratio is concerned, has been substantially the same on the Tucson division as on the Pacific lines and on the Salt Lake division?

A. I don't think so.

Q. You haven't prepared an exhibit on that?

A. I haven't prepared an exhibit on that. If you will name a few years, we can pull the reports and make a comparison or let's let it go and we will prepare an exhibit along that line.

Mr. Strouss: All right.

The Witness: That is, of course, if my counsel has no objection.

Mr. Mason: We will investigate the matter and I imagine [fol. 2308] if we don't, Mr. Strouss will investigate it, so the operating ratio and the trend in operating ratio will be revealed here. I think we have something already prepared which shows to some indication——

The Witness: That being the case, you will wait until this exhibit is presented before renewing your request?

Mr. Strouss: Yes. I would like, if you will do it, I don't want to take the time to go into each one of these now, but the years subsequent to 1931, if you will during the noon hour make a memorandum of the cost per train-mile on the Salt Lake division and on the Tucson division for the years subsequent to 1931. Subsequent to 1931 those costs included both main and branch line operation?

A. Yes.

Q. Could you do that during the noon hour?

A. Taken from the 521?

Mr. Strouss: 521.

A. Yes.

Mr. Mason: I think, your Honor, if the costs per train mile are to be shown, that is, if the plaintiff wishes to show them it should call its own witness and let me cross-examine [fol. 2309] that witness as to what he has done in preparing his showing. They are presenting a showing which we haven't undertaken ourselves and this is kind of a left-handed way of getting the showing. We may put in a showing of cost per train-mile on the two divisions with such explanation as the witness may care to make but this forces me to cross-examine my own witness upon an exhibit prepared by him.

Mr. Strouss: This witness has already testified to a comparison of operating costs on the two divisions.

The Court: Yes; the objection is overruled.

Mr. Mason: A comparison of operating costs?

Mr. Strouss: Yes, by states.

Mr. Mason: That is simply taken from the annual reports to the state commissions, I think.

The Court: To be frank, it does seem to the court if Mr. Strouss expects any new exhibits prepared by this witness or any other witness that he would then be in a position of having to call that witness as his own witness. I will give you full latitude to go into any matters that have been gone into on cross-examination.

Mr. Strouss: I am not asking him to prepare an exhibit. All I want him to do is to check their 521 forms so he can verify the figures. I asked him concerning their per train-[fol. 2310] mile costs on the two divisions.

Mr. Mason: And then you asked him to state them for the record or to be prepared after the recess to state them for the record. That is equivalent virtually to preparing an exhibit. It is certainly asking him to place in the record information which he has not hitherto shown. I don't understand he has testified, and I would like to have reference made to his testimony concerning operating costs on the Salt Lake division as compared to the Tucson division.

Mr. Strouss: The operating costs here have been, the comparison has been to the states as a whole. The Salt

Lake division covers the state of Nevada with a small part extending beyond that state. It happens that the Tucson division takes in practically all of the state of Arizona with the exception of the south line through Douglas. I am trying to get a comparison as near as I can from their own records as to their actual expenses.

Mr. Mason: The records are available, Mr. Strouss, and I suggest when the time comes that is a matter of affirmative showing. I agree that a comparison of the Salt Lake division and the Tucson division is highly pertinent and I take [fol. 2311] it that his request now is virtually a waiver of any objection to any comparison between the two states, but I think what he proposes to show is a matter of his own affirmative showing and might properly be introduced through his own witnesses at which time I could cross-examine the witnesses and develop any impairments, if impairments there be, as to a comparison of train-mile costs.

The Court: It would apparently be more expeditious if we are going into any detail on this to have such a schedule prepared in advance.

Mr. Mason: You understand your Honor, that the records from which he or his associates may prepare an exhibit and introduce it in his case are in his possession and I take it he has available to him a witness who is qualified to copy those figures off and place them in the record, just as qualified in that respect as he himself would be.

Mr. Strouss: I think I can find somebody to read those figures or copy them, but I want to say that Mr. Mason may think I have waived my objection as to the comparison, but what I have said is not in the way of a waiver. This evidence has gone in over my objection, and I have to [illegible]

The Court: The Court does not construe it as any waiver. [fol. 2312] You may proceed.

Mr. Strouss: We are on this question of whether he is going to look at this figures and be prepared to answer.

The Court: Well, on that, Mr. Masson, any data that can be readily procured, if counsel for the State desires, without great amount of labor I take it you will do that during the recess and be prepared to answer questions in connection with it.

A. Yes, your Honor.

The Court: By that I do not mean the preparation of any elaborate exhibits.

A. No, he simply wants me to draw up a memorandum of these costs.

Mr. Strouss: The totals, I am not asking for the detail. You may put that in if you want to, I have no objection to it.

Q. Yesterday you were asked concerning 490 cars at Yuma, how many trains of 70 cars and how many of 100 cars?

A. Yes, sir.

Q. Of course your answer to that question was on the assumption that that traffic was there available at the time?

A. Yes.

Q. In other words, in order to give the answer you did [fol. 2313] you would have to assume there were 490 cars of traffic available at Yuma at the time?

A. You would have to assume that there were 490 cars there, yes.

The Court: In other words, it was purely a hypothetical question?

A. As I understood it, yes.

Mr. Strouss: You were asked yesterday concerning gross ton-miles per freight train hour and the effect of speed on that item. Of course a train of two thousand tons at twenty miles an hour and a train of four thousand tons at ten miles an hour would get the same gross ton-miles per freight train hour, is that corect?

A. At ten miles an hour, yes.

Q. Lighter tonnage and faster speed would give you the same gross ton-miles per freight train hour as a heavier train at slower speed where the multiples of speed times tonnage give the same results?

A. Yes.

Q. Your hot-shots are examples of the lighter tonnage and faster trains?

A. And we get them over the road in a hurry.

Q. That is what I understand. Your exhibit No. 162, "Freight Service Operating Averages, Pacific Lines." I

[fol. 2314] believe you testified that item 4 includes non-revenue as well as revenue freight?

A. Yes.

Q. Is that item 1, does your exhibit No. 115 show the segregation of main and branch line mileage for the Pacific lines as a whole?

A. Yes.

Q. So that that can be determined from that exhibit?

A. Item 1 is the average over the year, average at the end of each month and the figure shown on No. 115 is the miles operated as of the close of the year. That is that difference there.

Q. The total of column 3 would give the total of the branch lines for the Pacific lines, I am speaking of exhibit No. 115 now?

A. Yes.

[fol. 2313] Q. And column 2 is the total main line?

A. Yes, as of the end of the year.

Q. Yes. Now, items—

Mr. Mason: (Interrupting) I think there is one thing more that his attention should be called to—I apologize for interrupting—one is the total mileage operated in steam, and the other is total mileage of road operated in freight service. I don't mean to interrupt your cross-examination.

Mr. Strouss: I am trying to find out what that item 1 represents. If there is a difference there I would like to know what the difference is in main lines operated and mileage of branch lines operated included in item 1 in exhibit 162. Can you give me that? This is freight service. If it is going to take a little time to determine it we can save time by doing it at the noon hour.

A. Just a minute, I may have it. No, it would take a little time to get that, Mr. Strouss.

Mr. Strouss: You don't need to take all of those years shown. If you will take the three last years, 1936, '38 and '39, when you get the segregation for those three years.

Q. Now, items 8, 9 and 10, those items, of course, are affected by availability of traffic, are they not?

[fol. 2316] A. Yes; if you didn't have traffic to fill out the trains—

Q. And item 10, of course, is affected by helper service that is required in a particular division?

A. Yes.

Q. And what about switching as affecting item 10?

A. Road switching.

Q. Road switching. Now, of course, that is true of that same item in exhibits 163 and 164?

A. Yes.

Q. By the way, I think I will only ask you to give me for the year 1939, but will you give me the segregation of main-line and branch lines shown in item 1 of each of those three exhibits?

A. Only for '39?

Q. Only for the year '39. Now, your exhibit 165, column 1, freight revenue per freight service train-mile. Branch-line operations would have an effect upon the amounts shown there, would they not?

A. In some degree, yes.

Mr. Strouss: Do you have any objection, Mr. Mason, on your exhibit 166 Mr. Masson has given a detail of perish-
[fol. 2317] ables, the total products of agriculture and grand total of carload lots. Now, I would like both as to cars and tonnage the totals for different headings set up in your annual reports like products of mines and products of manufacturing. Have you any objection to Mr. Masson giving that detail for each of those three states, four, I guess.

Mr. Mason: Let's see, there is the System, and Arizona, New Mexico, and Nevada. You would like to have each of the other major subdivisions which the Commission recognizes in its reports, products of mines, products of forests, products of manufacturing?

Mr. Strouss: Yes.

Mr. Mason: And what is the other, products of animals and products of miscellaneous?

Mr. Strouss: Yes.

Mr. Mason: No, I wouldn't have any objection.

Mr. Strouss: I would like to have total cars and total tonnage both.

The Witness: Could I just read that into the record?

Mr. Strouss: Yes, you may read it into the record.

Mr. Mason: That is quite a job.

[fol. 2318] The Witness: He just wanted totals.

Mr. Mason: You want the total cars and total tonnage?

Mr. Strouss: Yes.

Mr. Mason: Of course, 166 to 169 inclusive don't show tonnage.

Mr. Strouss: Yes, I realize that.

The Witness: You don't want it broken down by the various columns?

Mr. Strouss: No, just the totals.

Mr. Mason: I think that can be gotten readily. I think it would be better though, Mr. Strouss, to introduce it in the form of an exhibit rather than to read it into the record.

Mr. Strouss: Yes.

Mr. Mason: We will have it prepared.

Mr. Strouss: I am not going to be able to finish with Mr. Masson now; and probably will be several days. I want to examine the annual reports to Nevada and the annual reports to Arizona before I complete my cross-examination, and I don't believe I will be able to do that this week. Mr. Masson tells me he is going to Chicago Sunday night.

Mr. Mason: Yes, he has a very important meeting in Chicago, but we will recall him.

[fol. 2319] Mr. Strouss: It might be after I have finished examining those I won't have any further cross-examination, but I don't want to release him until I have determined that.

The Witness: Now, as I understand it, you only want that segregation of commodities by general classes for the one year 1939?

Mr. Strouss: That is right.

Mr. Mason: The cars and tons corresponding to the territories and subdivisions shown on exhibits 166 to 169 inclusive?

Mr. Strouss: That is right.

Q. Now, I asked you some questions concerning exhibit 169 yesterday, whether the total shown in column C would substantially represent the traffic originating within the state. I think that, in response to my question and in response to further questions by Mr. Mason, that your testimony is that with the exception of probably around 500 cars received from so-called short lines, and possibly a hundred which, as I remember it, you testified you couldn't be certain of that, but Mr. Mason's question was a hundred cars received from the Union Pacific and the Western Pacific, that this would represent the traffic originating in Nevada?

[fol. 2320] A. On our line.

Q. Well, adding to that the cars, around 500, originating on the short lines and, say, around 100 on the two transcontinental lines, if that is all the traffic that does originate on those connecting lines, that 600 added to this 5,351, then, would be the total of traffic originating in Nevada?

A. In the state, yes.

Mr. Mason: You mean, of course, originating in Nevada and handled wholly or partially by the Southern Pacific?

Mr. Strouss: Oh, yes. I realize this doesn't show traffic handled by the Union Pacific.

Q. And column C on Exhibits 166, 167 and 168 have the same general meaning?

A. Yes, they represent cars that originated on the line, on our line.

Q. Now, in Exhibit 172, is rent paid to subsidiaries reflected in any way in that exhibit either as income received or expenses paid?

A. The corporate expenses of subsidiaries are not in there.

Q. You have testified concerning rentals of properties from subsidiaries. My question is——

A. No, that is not in there; that would be rent for lease of [fol. 2321] road, that would be an income charge.

Q. But is it included in there as operating expense?

A. No, rent that we pay to a subsidiary for lease of road would be an income charge to the Southern Pacific Company and an income receipt to the subsidiary.

Mr. Mason: I think the question was whether—did you have in mind, particularly, Mr. Strouss, whether it would be included in item 6 on the first sheet?

Mr. Strouss: Yes, whether it is considered as an operating expense.

A. No, that is not an operating expense. The only rentals that are in there are the rentals for joint facilities of one kind or another, and those joint facilities are entirely with lines that are not leased, foreign lines, or lines that are not leased.

Q. And that is not an operating cost?

A. Rents of leased road is not an operating cost.

Q. I asked you earlier this morning about the valuation which you use here, and you testified that it is not the same

[fol. 2322] valuation as Mr. Baker used in his exhibits 111 to 114, inclusive. This is the book value.

A. That is the book value, yes.

Q. What does book value represent in the accounting system of the Southern Pacific Company?

A. Book value represents outlays of money for road and equipment.

Q. Actual money that has been spent over the whole period of years?

A. The whole corporate existence.

Q. The whole corporate existence. And the valuation that Mr. Baker testified to was the valuation allowed by the Interstate Commerce Commission, with additions to date?

A. That is correct.

Q. Which was the reproduction new, so to speak, of that property at the time that valuation was made?

A. I think it was, yes, sir.

Q. I noticed in your exhibit No. 173 that during the period 1925 to 1931 inclusive, you increased your funded debt by a little over four million dollars; is that correct?

A. Yes.

Q. And during that same seven-year period you paid out in dividends a total of one hundred seventy-seven million, [fol. 2323] eight hundred odd thousand dollars, approximately $178,000,000.

A. We paid out in dividends the amounts as shown in the respective columns.

Q. You haven't totaled it?

A. I haven't totaled it.

Q. Now, where in this exhibit, does rental on leased properties, properties leased from your subsidiaries appear?

A. That would go into miscellaneous deductions from income.

Mr. Mason: Will you identify it by line?

A. That would be included in item 14 there, in line 14.

Mr. Strouss: Now, while that is paid to a subsidiary which is wholly owned by the Southern Pacific Company, it only is shown in income where there has been a dividend paid by that subsidiary, is that correct?

A. That doesn't especially include rentals paid to subsidiaries. As a matter of fact, there is little or no such rental in that account, because our leases with the subsidiaries now provide that we simply make them whole for

such charges as they are obligated for. We pay their bond interest, we pay their corporate expenses. After every-
[fol. 2324] thing is said and done, there is little left to the subsidiary. The rents for lease of road, the majority of amounts there represent a piece of track we lease from other foreign roads.

Q. In other words, your leases with subsidiaries are not a lump-sum lease, but a lease in consideration of your paying the different named items of cost or expense?

A. Yes.

Q. This exhibit, of course, as is indicated at the top, is for the entire Southern Pacific Transportation system?

A. Yes.

Q. Which includes the steamship lines and all properties owned or operated by the Southern Pacific?

A. All properties operated by the Southern Pacific. Now, let me correct that; all properties that are operated by the Southern Pacific as part of its transportation system. The steamship lines and the P. & N. O. of course, are separately operated properties within the System.

Q. But are included in this exhibit?

A. Yes.

Q. The Pacific Electric?

[fol. 2325] A. No.

Q. Is not in here?

A. No.

Q. It is not operated by the—

A. It is not a part of the transportation system. While the Southern Pacific owns the entire outstanding capital stock of the Pacific Electric, it is not operated as part of the Electric, it is not operated as part of the transportation system.

The Court: We will take our noon recess at this time, and resume at two o'clock.

(Thereupon, the court stood at recess until two o'clock, P. M. this day.)

[fol. 2326] 2 P. M., January 15, 1941.

All parties being present as heretofore noted, proceedings were resumed as follows:

L. J. Massox resumed the witness stand.

The Court: You may proceed.

Mr. Mason: Your Honor will recall when exhibits No. 11 and No. 12 were offered objection was made on the ground that the underlying documents were not produced and available for purposes of cross-examination. Mr. Porter, who offered these exhibits, has since returned to New York City and now Mr. Strouss and I have reached I think an agreement which will obviate his being returned here and also obviates the objection so far as it was predicated upon incompetency. I understand that you still want to reserve your objection as to relevancy.

Mr. Strouss: Yes.

Mr. Mason: By stipulating as to exhibit No. 11 that column C, freight operating expenses, represents the total of the entries in the annual reports of the New York Central and its leased lines for the years shown as they appear in accounts 201 to 462, inclusive, including all intermediate [fol. 2327] numbers which appear on the form A, annual report, and that the figures for freight transportation expenses, column D, represent the totals as they appear in accounts 371 to 420, inclusive, including entries in intermediate accounts upon the same annual reports. Is there any stipulation we ought to enter into as to exhibit No. 12; the freight service operating averages?

Mr. Strouss: No, I think the questions I asked Mr. Porter when he was here covered that sufficiently.

Mr. Mason: With that understanding then, may the exhibits be received subject to the objection as to relevancy.

The Court: You are now again offering them subject to that objection?

Mr. Mason: Yes.

Mr. Strouss: I thought in reading over the records they were admitted in evidence.

The Court: The court indicated I was going to strike them.

Mr. Strouss: The record would now show that you have complied with the requirement to produce the underlying records.

The Court: That is right.

Mr. Mason: Or that the production of those records has [fol. 2328] been waived.

Mr. Strouss: Yes. Of course we still reserve our objection as to the relevancy and materiality.

The Court: Well, the objection as to the relevancy is overruled and the documents may now be considered in evidence, having been heretofore admitted in evidence and the defendant having met the objection that the Court raised in the matter at the time.

Mr. Mason: I will advise Mr. Porter accordingly and that part of the matter will be closed.

Mr. Strouss: I will say for the record so far as we are concerned we do not require Mr. Porter to return for further examination. When he left, there was a reservation that I could recall him but we now release him.

Mr. Mason: I would like to have the record show my appreciation of your courtesy, Mr. Strouss.

Mr. Strouss: Mr. Masson, did you get those figures that I requested?

A. The cost per train-mile?

Q. Yes, we have 1930 and 1931 in the record already.

A. 1930 I couldn't verify because I don't have the basic figure.

Q. 1932, Tucson division, $1.006?

[fol. 2329] A. Correct.

Q. Salt Lake division, $0.952?

A. Correct.

Q. 1933, Tucson division, $0.944?

A. Correct.

Q. Salt Lake division, $0.938?

A. Correct.

Q. 1934, Tucson division, $0.934?

A. Correct.

Q. Salt Lake division, $0.918?

A. Correct.

Q. 1935, Tucson division, $1,037?

A. Correct.

Q. Salt Lake division, $1.013?

A. Correct.

Q. 1936, Tucson division, $1.13?

A. Correct.

Q. Salt Lake division, $1,103?

A. Correct.

Q. 1937, Tucson division, $1.252?

A. Correct.

Q. Salt Lake division, $1.198?

A. Correct.

Q. 1938, Tucson division, $1.285?

A. Correct.

Q. Salt Lake division, $1.207?

[fol. 2330] A. Correct.

Q. 1939, Tucson division, $1.215?

A. Correct.

Q. Salt Lake division, $1.151?

A. Correct.

Q. These figures which we have just given from 1932 to 1939 are for main line and branch combined?

A. Yes.

[fol. 2331] Mr. Strouss: Now, did you get a break-down of those commodities by commodity?

A. No, I didn't do that. I will later on in this trial present an exhibit that will show that, if that is satisfactory to you.

Mr. Strouss: Yes, that is all right.

Q. Now, the main line operated and branch line operated, item 1, of the exhibits 162, 163 and 164.

A. 162 cover the System. I haven't any figures here, I may have them later on in the afternoon. I have asked San Francisco to furnish them. On 163, I understood you to say, you only wanted the last.

Q. 1939.

A. Yes, 1939. I have 1939. 1939, for the Tucson Division, Exhibit 163, Main Line, 629.30; branches 326.43, which totals the 955.73 shown on the exhibit. On exhibit 164 for the Salt Lake Division, miles of line operated, main line, 722.12, branches 356.20, which totals 1,078.32 shown on the exhibit.

Mr. Strouss: No further questions.

Mr. Mason: No further questions.

The Witness: Do I understand that you are not releasing me now?

[fol. 2332] Mr. Strouss: That is right. At this time I want to go over the Arizona items.

Mr. Mason: I think, your Honor, that I can defer any redirect examination until the cross-examination has been completed. It would probably be preferable.

The Court: All right.

Mr. Mason: So we can excuse Mr. Masson for the time being.

The Court: You may be excused for the time being. You may call your next witness.

Mr. Mason: We will call Mr. G. C. Baker.

G. C. Baker was called as a witness on behalf of the defendant and, being first duly sworn, testified as follows:

Direct examination.

By Mr. Mason:

Q. Please state your name and official headquarters, Mr. Baker.

A. G. C. Baker, San Francisco, California.

Q. Are you employed by the Southern Pacific Company?

A. Yes, sir.

[fol. 2333] Q. In what capacity?

A. Assistant superintendent of transportation, Pacific Lines.

Q. How long have you been assistant superintendent of transportation?

A. Since August, 1939.

Q. Have you had previous railroad experience?

A. Yes.

Q. With what railroads?

A. Principally all my railroad experience has been on the Southern Pacific, that is, the lines which comprise the Southern Pacific such as the Arizona Eastern and the E. P. & S. W.

Q. You started with the Arizona Eastern?

A. Yes, sir.

Q. When?

A. 1916, as an operator on the old Globe Division.

Q. Then you worked for a while for the El Paso and Southwestern?

A. Yes, sir.

Q. When that was an independent property?

A. Yes, sir.

Q. Where did you work for the El Paso and Southwestern?

A. On the Western Division at various points between [fol. 2334] Douglas and El Paso.

Q. Did you work for a while at El Paso itself?

A. Yes, at the Union Depot for the Union Depot Company.

Q. When did you go to work on the Tucson Division of the Southern Pacific?

A. June, 1918.

Q. In what capacity?

A. As telegraph operator.

Q. And how long did you work as an operator and agent on the Tucson Division at that time?

A. From 1918 until 1923 I worked as an operator, and then I was assigned duties as a train dispatcher, and I continued as train dispatcher until 1932 at Tucson, when, due to reduction in forces, I was sent to El Paso as train dispatcher.

Q. Now, as operator and agent on the Tucson Division in the period between 1918 and 1923, did you serve at various points along the line?

A. Yes.

Q. You served, then, as dispatcher at Tucson for nine years, approximately.

A. Yes, sir.

Q. And then at El Paso for how long?

A. I was in El Paso on two different occasions. The first [fol. 2335] time about six months, and the second time about three months.

Q. After your experience at El Paso as train dispatcher, what positions did you next occupy?

A. I was brought to Tucson in October, 1936, as acting chief train dispatcher, and in December of the same year I was appointed chief train dispatcher for the Tucson Division.

Q. Did you serve as agent at Gila or Yuma?

A. Yes, I was agent at Gila a year, and I was agent at Yuma for two and a half years.

Q. Was that immediately prior to 1936?

A. Yes, sir.

Q. When you were train dispatcher at El Paso, were you employed on the Rio Grande Division?

A. Yes, sir.

Q. How long were you chief dispatcher at Tucson?

A. From October, 1936 until August, 1939.

Q. Since 1939 you have been assistant superintendent of transportation?

A. Yes, sir.

Q. Will you describe your duties as assistant superintendent of transportation?

A. Well, the superintendent of transportation, to whom [fol. 2336] I am assistant has jurisdiction over the distribution of freight and passenger equipment on the Pacific Lines. We distribute it so as to protect the traffic needs of the shippers, and the needs of the traveling public. We also make our passenger and freight schedules, supervise the maintenance of those schedules to see that on-time performance may be made as nearly as possible, and we also handle all car service matters and the interchange of traffic with our connecting lines.

[fol. 2337] Mr. Mason:

Q. Who is the superintendent of transportation?

A. W. B. Kirkland.

Q. Are you his immediate assistant next in charge of the department or bureau called "Office of the Superintendent of Transportation"?

A. Yes.

Q. Does your jurisdiction extend to all parts of the railroad system known as the Pacific lines?

A. Yes, sir.

Q. Are you familiar with the documents sometime heretofore described as the working timetables or employees' timetables?

A. Yes, I am.

Q. Are those prepared and kept of record in the Office of the Superintendent of Transportation?

A. They are in this way, we set up the schedules but the immediate work is done by the chief train dispatcher of each division.

Q. Have you yourself as dispatcher and as chief dispatcher participated in the preparation of timetables?

A. Yes.

Q. I have here a file and I will ask you to examine the file of timetables which bears at the top, "Southern Pacific [fol. 2338] Company, Pacific Lines, Timetable for the Western Division, 231, to take effect Sunday, September 29,

1940, at 12:01 A. M." Will you examine that and the other timetables and state whether this folder of timetables which you have before you is a complete set of the most recent employees' timetables for the Pacific lines including paired track territory?

A. They are with one exception, there is a later Western Pacific timetable out that was effective on January 5, 1941, that is the Western Pacific on paired track territory.

Q. That would replace the Western Pacific paired track timetable which is included within this group, would it?

A. Yes, sir.

Q. Does that later timetable for the Western Pacific make any changes or substantial changes so far as you know with respect to the operation of Southern Pacific trains?

A. None whatever in the operation of Southern Pacific trains. Their times are the same. They made a few changes in the Scenic Flyer.

Q. There is a train here referred to as the "Exposition Flyer"?

A. That is it.

Q. Their train No. 40?

[fol. 2339] A. Train No. 39 and 40, there are slight changes made in their schedules.

Mr. Mason: Have you any questions as to these timetables, Mr. Strouss?

Mr. Strouss: No.

Mr. Mason: We intend to offer them now as an exhibit by this witness. These or their predecessors in issue have been furnished during or prior to the start of the trial. We offer this group of timetables as one exhibit, your Honor.

Mr. Strouss: No objection.

The Court: It may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 175.")

Mr. Mason:

Q. Mr. Baker, I notice that certain of these timetables, for example the Salt Lake division timetable, show the name of G. C. Baker as assistant superintendent of transportation. Are you the G. C. Baker whose name is shown there?

A. Yes, sir.

Q. That appears on others of these timetables?

A. Yes, sir.

Q. I think you spoke a few minutes ago in describing your duties, that the Office of Superintendent of Transportation deals with schedules of freight and passenger trains?

[fol. 2340] A. Yes, sir.

Q. I will ask you whether the Southern Pacific Company maintains or jointly with other carriers participates in maintaining through schedules for the movement of freight in transcontinental movement, that is to say, between the eastern part of the United States and the Pacific Coast territory?

A. Yes, it does.

Q. Addressing yourself to the map, exhibit No. 1, the enlargement of which is on the easel, over what routes do those schedules apply, as the routes appear upon that exhibit?

A. Our main route is the route between Roseville and Ogden, which we generally refer to as the "overland route" and over the southern route between Colton, California, and El Paso-Tucumcari, New Mexico.

Q. Those schedules between Roseville and Ogden and between Colton and El Paso-Tucumcari, do you have in mind particularly eastbound schedules?

A. Eastbound, yes.

Q. As to the westbound schedules, do those apply to Pacific Coast terminals?

A. Yes, except on your westbound schedules the schedules are extended to the Bay area, San Francisco-Oakland, [fol. 2341] on the overland route and to Los Angeles and San Francisco via southern route.

Q. Do the westbound schedules contemplate any delivery times at intermediate points, such as Sacramento, off direct route points, such as Fresno?

A. We don't have what is stated as an actual arrival time at those points, but we do have a day of arrival designated, for example, from Chicago to Sacramento as the fifth day, although it generally provides a sixth morning delivery. The same is in effect with respect to Fresno traffic.

Q. As to schedules eastward and westward through the southern route between Los Angeles or Colton, as the case may be, and eastern points, with what carriers at the El Paso gateway are these schedules jointly maintained?

A. Santa Fe, Texas and Pacific, and the T. & N. O. line.

Q. Do they extend to the eastern connections of those railroads at their terminals or junctions?

A. Yes, and their connections.

Q. With what carrier at the Tucumcari gateway?

A. The Rock Island.

Q. Does that contemplate through movement, Southern Pacific and Rock Island, to eastern consuming points?

[fol. 2342] A. Yes.

Q. Will you name some of those points?

A. The principal ones are Kansas City, St. Louis, and Chicago.

Q. Do the same schedules apply over alternate routes beyond the Missouri River, for example?

A. Yes.

Q. Will you indicate what some of those other routes might be?

A. Out of Kansas City we have the Alton; the Wabash; the Rock Island also operates east of Kansas City into St. Louis; the B. & O., I believe, I am not sure, I believe the B. & O. operates with a connection out of Kansas City.

Q. Would that be in connection with the Alton out of Kansas City?

A. Yes.

Q. Do those schedules apply with a delivery time at St. Louis?

A. Yes.

Q. Is there any schedule in connection with this movement over the southern route contemplating delivery at points like Washington or Philadelphia or New York City?

A. Yes, sir.

Q. What carriers would participate?

[fol. 2343] A. The principal perishable carriers east of Chicago generally referred to are the Erie, Pennsylvania, and New York Central lines, and out of St. Louis the Pennsylvania is one of the principal carriers.

Q. As to the movement through the Ogden gateway over the route from San Francisco or Roseville eastward, with what carriers does the Southern Pacific participate in movement through that gateway?

A. We make direct connections with the Union Pacific and the D. & R. G. W. at Ogden.

Q. The Union Pacific, it has been previously testified, terminates at Omaha?

A. Yes.

Q. Do the schedules apply in conjunction with the connections at Omaha or Council Bluffs?

A. Yes.

Q. What lines east of Council Bluffs?

A. Chicago & Northwestern, they have several lines there, Chicago & Northwestern; Illinois Central; and the C. & G. W.

Q. Do other Missouri River lines participate if there are other lines operating between Council Bluffs and Chicago?

A. Yes, they all participate in the through schedules.

[fol. 2344] Q. As to westbound schedules, do you have a corresponding participation in the same manner as the eastbound?

A. Yes, the same manner.

Q. Mr. Baker, have you before you a chart exhibit in one sheet bearing also some typewritten material and showing in the lower righthand corner of the sheet "Southern Pacific Company (Pacific Lines), Eastward Perishable and Westward Manifest Schedules"?

A. Yes, this is for the southern route.

Mr. Mason: May we have this chart marked as "Defendant's Exhibit No. 176" for identification?

The Court: It may be marked.

The Clerk: Defendant's exhibit No. 176 for identification.

Mr. Mason:

Q. Did you prepare exhibit No. 176 for identification or supervise its preparation?

A. Yes, I did.

Q. First of all I will ask you as to the information shown in the table at the righthand side of the sheet headed "Over-all Times." From what did you take that information?

A. That is the over-all time shown in our schedules which is the over-all time from departure, in this first case, [fol. 2345] from Chicago and Los Angeles.

Q. Is this information taken from the record of these schedules actually maintained in the Office of the Superintendent of Transportation?

A. That is right.

Q. Do these represent the present-day schedules?

A. Yes, sir.

Q. Going to the chart itself, do you show on the chart the names of certain cities or stations with figures? What is the significance of these names of towns and stations and why are they placed in this particular order?

A. The numeral appearing after those stations is the distance from Colton, California.

Q. Why are these stations placed in the order in which they appear? You place first Los Angeles, then Colton, then Yuma, and so on.

A. That is on a direct route in which they appear on our lines.

Q. What is the significance of the spacing between successive stations, that is, for example, you have Colton and Los Angeles fairly close together and quite a distance between Tucson and El Paso?

A. That is the mileage that was drawn to a certain mileage scale.

[fol. 2346] Q. Is this an approximate mileage scale all the way across from Los Angeles to Chicago and St. Louis?

A. Yes.

[fol. 2347] Q. Now, you show St. Louis once on the chart adjacent to New Orleans and then again on the chart at the extreme lower right-hand corner. Do those represent mileages to St. Louis by two different routes?

A. That is right; the first one to St. Louis, 1998 miles via Kansas City, and the other one to St. Louis, 2,458 miles is from Los Angeles via Corsicana. The first one there; 1,998 miles, is the mileage from Colton to Kansas City via—Colton to St. Louis via Kansas City.

Q. Now, the route via Kansas City, is that also the route via Tucumcari?

A. Yes, sir.

Q. And is a relatively direct route?

A. Yes, sir.

Q. Whereas the other is the route by the Texas & New Orleans via San Antonio and Corsicana?

A. Yes, sir.

Q. And then by what railroad?

A. The Cotton Belt, the St. Louis and Southwestern.

Q. Now, you show New Orleans adjacent to St. Louis on the chart. Is there merely because the mileage happens to fall close together?

[fol. 2348] A. Yes, sir.

Q. And, by the way, this mileage from New Orleans, is that 1,991 from Colton, or 1,991 from Los Angeles?

A. That is from Los Angeles.

Q. Now, on the right-hand side of the chart, you start out—I should say on the left-hand side of the chart, but it is also on the right-hand side, you show a series of blocks designated by horizontal lines and then the first, naught day, first day, and so on. Reading down from the top of the chart, what is the significance of that particular portion of the chart?

A. Each one of those blocks represents a twenty-four hour period.

Q. Now, let us go to the line which starts at a point on the vertical line opposite the word "Colton" and which is marked "3:00" in the upper left-hand corner of the chart, and which appears to continue with some breaks until it ends opposite the line which represents or appears opposite the name of Chicago between the sixth and seventh days in the lower right-hand corner of the chart, in other words, the upper slant line that runs from the upper left-hand corner toward the lower right-hand corner of the chart; what does [fol. 2349] that line indicate?

A. That line indicates the basic schedule of our Colton freight trains and the three dash zero, zero, represents three A. M. departure from Colton. On the first line there opposite Yuma, it shows 3:00 P. M. and 4:00 P. M.

Q. At Yuma?

A. At Yuma.

Q. How do you know that that is 3:00 A. M. at Colton? Is that because it is in the first part of the day?

A. That is right. It is near to the top of the block.

Q. And do you know it to be 3:00 P. M. at Yuma for the reason it is near the end?

A. Yes, sir.

Q. Would that explanation apply to other times shown on the chart?

A. Yes, clear through.

Q. What is the significance of the line which starts at the vertical line opposite Colton at a point designated "7:00" and which apparently would be 7:00 P. M.?

A. That is the rip-off schedule.

Q. Are those lines associated with the tabulation of overall times on the right-hand side of the exhibit?

[fol. 2350] A. Yes.

Q. Now, you show, for example, under column A, Colton Basic, and then under column B, Colton, then under column C, Chicago, then under column D, Hours and Minutes. Does the line marked "Basic" here correspond with that basic schedule from Colton?

A. Yes, that is a 3:00 A. M. departure from Colton on the first day with 12:30 A. M. arrival at Chicago on the seventh day, 139 hours 30 minutes.

Q. Is that the present-day schedule from Colton to Chicago?

A. The present-day schedule.

Q. You show here a figure "16 hours" which apparently is the time interval from 3:00 A. M. to 7:00 P. M. What is that 16 hours?

A. That is what we call—we have a sixteen-hour run-off.

Q. And that sixteen hours is the run-off time?

A. Yes, sir.

Q. Then you speak of a run-off schedule. What is the significance, then, of the run-off schedule?

[fol. 2351] A. Well, due to the large area in which these perishables are loaded, from our concentration point it runs from Colton up around 204 miles, we allow shippers to load the traffic up to 11:59 P. M.

Q. Would that be on zero day?

A. On zero day. It is obvious that at a point, for instance, the Santa Maria Valley, over 200 miles away, loading up to 11:59 P. M., that we couldn't get out of Colton at 3:00 A. M. So we allow, in order that all shippers in the Zone 1 territories, the concentration points, will be on a comparable basis, we have what we call the 16-hour run-off, which provides that any traffic arriving at concentration points at or prior to 7:00 P. M. after the day loaded, will be afforded the basic schedule of that day.

Q. Does that mean that you operate that train so as to make the same arrival at Missouri River and Chicago as if it had left at 3:00 A. M.?

A. That is right.

Q. What happens to that sixteen hours?

A. Well, that is run-off. The run-off time is prorated between the various lines according to mileage or run-off agreements.

Q. Here you show, for example, on this run-off schedule, [fol. 2352] you show times at Yuma, Tucson, El Paso

and Tucumcari. Does that mean that the train making the run-off schedule has to operate to make those times at those intermediate points?

A. That is right.

Q. You show here also in the table an Imperial Valley schedule, and I notice a reference to Imperial Valley Schedule in the sloping lines, this sloping line happens to be a line consisting of long dashes, what is the basic schedule of the Imperial Valley traffic and from what point does that apply?

A. The concentration point for the Imperial Valley traffic is Yuma, and it is a one day shorter schedule than traffic from Colton. The traffic basic schedule is due to leave Yuma at ten A. M. on day one, and arrive at Chicago at 12:30 A. M. of the sixth day, or 109 hours and 30 minutes, as shown in the table.

Q. In order to place this on the same chart, however, you seem to show the departure from Yuma on the second day. Would that be the first day following loading?

A. That is the first day following loading, yes.

Q. Now, do you have a run-off on the Imperial Valley [fol. 2353] Schedule?

A. Yes, we have a six hour run-off on that. That is because the distance that the traffic is loaded is not so far away from the concentration point, and we only allow six-hour run-off on that traffic.

Q. Here, finally, you show another set of sloping lines that appear to go only as far as El Paso, consisting of dot or short dashes, an apparently basic Arizona schedule. To what traffic does that apply? From what concentration point and origin territory?

A. That applies to the traffic from the Salt River Valley, for which Phoenix is the concentration point.

Q. What is your basic departure time at Phoenix?

A. 12:01 A. M. and that traffic has a 24-hour faster schedule than the Yuma schedule and two days shorter than the Colton traffic.

Q. Do you have any run-off time on the Salt River Valley traffic?

A. Yes, we have a five-hour run-off on that traffic, which is put in principally for allowing the pre-cooling of traffic from the Salt River Valley.

[fol. 2354] Q. These basic schedules shown on the right-hand side, do they correspond exactly to these sloping lines from the upper left to the lower right?

A. Yes, they do.

Q. Now, as to the lines from the upper right to the lower left of the chart, which are designated with various letters and appear close to an arrow marked "westward," what is the significance of those lines?

A. Those are our westbound manifest schedules over the Southern route.

Q. You show the times, the over-all times for these westward schedules in the tabular block on the exhibit?

A. Yes.

Q. And then what do the lines indicate with reference to the westward schedules?

A. Well, the same as the lines for the eastward schedules there. For example, our first line "SSW (Sunset West)" that schedule is due to leave New Orleans at 9:00 A. M. the first day. You can trace that through to where it is shown due to arrive in Los Angeles at 7:00 P. M. of the fifth day, an over-all time of 108 hours.

Q. Now, you show that line from New Orleans converging [fol. 2355] with the line from Chicago, they apparently meet at El Paso. Does the same schedule continue from El Paso with one line?

A. No.

Q. Yes, it is from St. Louis.

A. It converges with the line from St. Louis to Chicago; that is the St. Louis via Corsicana Route, which converges and is consolidated and assumes the same schedule as the S.S.W. from El Paso.

Q. Then this other line originates apparently at—is that twelve noon at Chicago?

A. Twelve noon at Chicago.

Q. That represents the Chicago through schedule via what route?

A. The Rock Island.

Q. Via Tucumcari?

A. Yes, via the Tucumcari Gateway.

Q. I will ask you this, Mr. Baker, is the information shown on exhibit 176 for identification, information which comes to you regularly and necessarily as a part of your duties as assistant superintendent of transportation?

A. Yes, sir.

Q. Do you participate yourself in the making of these schedules, or any of them?

[fol. 2356] A. Yes; I take part in all discussions prior to the final schedule meetings in which the schedules are actually approved.

Q. Were any of these schedules placed in effect before you assumed your present position as assistant superintendent of transportation?

A. Yes, the westbound schedules were, and also the eastbound schedules were all in effect except the 12:30 A. M. seventh day arrival at Chicago has been changed. When I was first appointed assistant superintendent of transportation, the basic schedule at that time provided for 7:00 A. M. seventh day arrival at Chicago.

Q. That is the Colton schedule?

A. That is the Colton schedule, yes.

Q. Were you, as chief dispatcher at Tucson, familiar with these schedules to any extent?

A. Yes, very much.

Q. Does the chief dispatcher's duties include any observance of schedules?

A. Yes, that is one of his most important duties.

Q. Will you say whether or not the exhibit is true and correct as a representation of the basic schedules, of the schedules as indicated as they apply at the present time?

[fol. 2357] A. Yes, to the best of my knowledge and belief, it is.

Mr. Mason: Have you any questions, Mr. Strouss?

Mr. Strouss: Yes.

Q. Mr. Baker, on the line at the top left-hand side, beginning with the vertical line opposite the name "Colton" three A. M. and in Yuma three P. M., then the line drops down, apparently, the train leaves there at four P. M.; is that what that indicates?

A. Yes, that indicates one hour terminal time at that point.

Q. For icing?

A. For icing and inspection of train.

Q. At El Paso there is three hours?

A. That is right.

Q. Those trains from there on apparently go on through without any terminal delays?

A. Well, of course, on the Tucumcari route we would have some terminal delay at division terminals such as Carrizozo, but I don't show that thing on here because we

don't in our schedules show Carrizozo, but we do show in our schedules El Paso to Yuma time.

Mr. Strouss: This probably would be more cross-exami-[fol. 2358] nation, but I would like to ask this question.

Q. Is there no perishables, are they iced after they leave El Paso going east before they reach Chicago?

A. That depends on the class of refrigeration under which they are moved. If they are moved under standard refrigeration, they are iced at all icing stations between El Paso and Chicago.

Q. And this difference in arrival and departure would be due to some extent to delays for icing and inspection of trains?

A. Yes.

Mr. Strouss: That is all.

Mr Mason: Mr. Strouss asked you just now, Mr. Baker, if the hour's delay at Yuma was due to icing and inspection. Is there any other element of railroad operation that creates delay at Yuma?

A. Yes.

Q. What is it.

A. We have to reduce practically all our eastbound trains at Yuma to conform with the 70-car limit law of Arizona.

Q. Does that take up part of that hour that is shown as being allowed there?

A. Yes.

The Court: Mr. Baker, which side of the river are your [fol. 2359] yards located and where does this change take place?

A. On the Arizona side, your Honor.

Q. In other words, you run long trains across the river into Yuma?

A. Yes, sir.

Q. You have met no objection to that movement?

A. No, sir.

Mr. Strouss: That has been the case for years?

A. Yes, sir.

Mr. Mason: The choice, Mr. Baker, was between operating long trains into Arizona or constructing a terminal on the California side, wasn't it?

A. On the California side, yes, sir.

Q. What, if anything, has ever been done about this operation of long trains into Yuma that you know of?

Mr. Strouss: If you know?

A. I just don't quite understand your question, Mr. Mason.

Mr. Mason: Do you know of anything ever having been done by the state, county or city authorities as to the operation of long trains across the bridge at Yuma?

A. Oh, No.

[fol. 2360] Q. But there is a long train operation in Arizona there?

A. Yes, across the river into the yards inside of Arizona.

The Court: I think we will take our mid-afternoon recess at this time, gentlemen.

(Thereupon, a short recess was taken, after which the witness was recalled to the stand, and proceedings were resumed as follows:)

[fol. 2361] Mr. Mason: We offer exhibit No. 176 in evidence at this time.

Mr. Strouss: I have no objection.

The Court: It may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 176.")

Mr. Strouss: I have one further question I want to ask. You also take a full hour at Tucson as well as Yuma, do you not, Mr. Baker?

A. Yes, sir.

Mr. Mason: Mr. Baker, exhibit No. 176 as you stated in your references to it prior to its admission refers only to schedules on the so-called "southern route" or the route across Arizona, is that correct?

A. That is correct.

Q. I will ask you if the schedule eastward from northern California concentration points particularly Roseville on the eastward movement of perishables is the same so far as the over-all-time is concerned to Chicago and St. Louis?

A. That is correct, the basic schedule is the same from all California concentration points.

Q. What about the cut-off or run-off time from Roseville, is that the same?

A. It is the same.

[fol. 2362] Q. You show a present-day schedule, Colton to Chicago, of 139 hours and 30 minutes with a cut-off schedule of 123 hours and 30 minutes. Have those times always been the same as they are at present?

A. No, there have been numerous changes in those schedules. In April, 1918, they had an over-all schedule of 189 hours with no run-off.

Q. Did that apply alike at Roseville and Colton?

A. Yes.

Q. What provision, if any, was made as to the so-called "Zone 1 territory" or origin territory?

A. At that time there was only Zone 1 territory which was in close proximity to the concentration point, within fifty to one hundred miles.

Q. Are Colton and Roseville themselves points of heavy production?

A. No, there is heavy production in close proximity to those points, like the hillside fruit country around Roseville and the orange groves south of Colton and Riverside.

Q. What was the departure time at Roseville on the 1918 schedule of 180 hours?

A. That was 3 A. M. the first day.

Q. Was that the day following loading?

[fol. 2363] A. Following loading.

Q. And the arrival at Chicago?

A. 5 P. M. the eighth day.

Q. Was there any provision for run-off at that time?

A. No.

Q. Was there a similar schedule from Colton at that time?

A. Yes, from Colton we had 189-hour schedule providing for a six A. M. first-day departure from Colton to 5 A. M. the ninth-day arrival at Chicago with no run-off provided.

Q. When was the next change made in the basic schedule from Roseville and Colton and what did it amount to?

A. February, 1921, after the period of government control the basic Colton schedule was reduced to 154 hours and the Roseville schedule to 154 hours.

Mr. Strouss: Don't we have this in the record already, Mr. Mason?

Mr. Mason: I think not so far as the Southern Pacific is concerned, not the same history that the witness has before him now. We have some history but not in the same fashion so far as Southern Pacific is concerned. It addressed itself to the Santa Fe and the witness Fertig [fol. 2364] of the Rock Island gave some of the story of the schedules but all that either of them said so far as Southern Pacific was concerned was that all of the competing and connecting lines make the same schedules.

Mr. Strouss: I had forgotten that it didn't apply to the Southern Pacific.

Mr. Mason: I know that it does apply to the Southern Pacific but I don't know that the record shows it.

The Court: Let's shorten it if we can.

Mr. Mason: I will shorten it as much as possible and simply refer to the times and the dates.

Q. After 1921 was there a change to provide for a run-off time?

A. On the Colton schedule, in September, 1924, they provided a three-hour run-off schedule.

Q. With 154 hours basic?

A. 154 hours basic.

Q. When was the next change in the Colton schedule?

A. In the Colton schedule in 1927 a run-off time was increased to seven hours.

Q. Was there a change made in the Roseville schedule in 1926?

A. In 1926 there was a twelve-hour run-off established. [fol. 2365] Q. With the same basic time of 154 hours?

A. Yes.

Q. Will you refer to the 1929 changes?

A. On the Colton schedule in June, 1929, the schedule was reduced to 146 hours with a seven-hour cut-off and the Roseville schedule was also reduced to 146 hours basic schedule with a sixteen-hour run-off.

Q. That took place in June, 1929?

A. Yes.

Q. Was the Colton schedule later changed so as to provide also a sixteen-hour run-off?

A. Yes, that was done in May, 1932, and both schedules remained the same until May, 1940, when the present schedule of 139 hours and 30 minutes with a sixteen-hour run-off was established.

Q. What was the change made in August, 1937, insofar as perishable from Zone 1 territory was concerned? Was there a change made in August, 1937, in that respect?

A. Yes, there was a change made there to provide that perishable from Zone 1 territory which arrived at California concentration points up to 7 P. M. would be provided with what they call Zone 1 schedules which provide [fol. 2366] for 3 A. M. basic schedule first day after loading.

Q. Is the Zone 1 territory which concentrates at Colton and takes a schedule out of Colton the same territory as the Zone 1 territory which concentrates at Roseville and takes a schedule out of Roseville?

A. No, Colton is a concentration point for traffic as far north on the coast line, which includes the Santa Maria and Guadalupe districts, and as far north on the San Joaquin Valley route as Caliente.

Q. Caliente is a point just a short distance south of Bakersfield?

A. South of Bakersfield.

Q. What is the distance from Caliente to Colton?

A. It is approximately 215 miles.

Q. And from the Santa Maria Valley to Colton?

A. 260 some odd miles.

Q. Has the Zone 1 territory for Colton always included this extent of Zone 1?

A. No, at first it only embraced the territory in close proximity to Colton, such as the south branches from Los Angeles around Santa Ana and Riverside and those points.

Q. That would be the territory intermediate between [fol. 2367] Los Angeles and Colton?

A. Yes.

Q. When was the extension made to include the Santa Maria Valley?

A. That was made in May, 1932.

Q. What is the present extent of the Zone 1 territory from Roseville southward?

A. That extends as far south as the Arvin branch, which is just south of Bakersfield, on the Arvin branch out of Bakersfield, a distance of approximately 310 miles, I believe it is.

Q. Does it extend north of Roseville in the Sacramento Valley?

A. Yes, it comprises both sides, east and west side of the Sacramento Valley as far north as Tehama where the two lines converge.

Q. Does it include the San Francisco Bay district?

A. The Bay district and also the northwest Pacific territory as far north as Ukiah.

Q. Does it include the producing area around Salinas and Watsonville?

A. Yes, it goes as far south as Molus on the south line, which is a point just out of Salinas.

Q. You mean on the coast line?

A. On the coast line.

[fol. 2368] Q. Does it include the Santa Clara Valley around San Jose?

A. Yes.

Q. Has that Zone 1 territory for Roseville been extended from time to time?

A. Yes, that has been extended from time to time since July, 1926.

Q. Was it first established in July, 1926?

A. It was established before that but at that time it only took in a small amount of territory around Roseville.

Q. As far as Stockton?

A. Stockton and Walnut Grove branches and what they called the "hillside fruit," which is east of Roseville, and some traffic up as far as Marysville.

Q. Is there any extension of the release time of shipments past 11:59 P. M. of the day of loading by reason of precooling?

A. Yes, in California we have agreed to let the shippers precool up to 5 A. M. following the date of loading.

Q. Does that mean that the traffic need not be released by the shipper until 5 A. M.?

A. That is right.

Q. Does such precooled traffic released at or prior to 5 A. M. take the schedule originating at 3 A. M. of that [fol. 2369] day?

A. That is right.

Q. Does that apply from both northern and southern California?

A. Yes, sir, with the exception that there is very little pre-cooling done on the Colton traffic with the exception of Valencia oranges.

Q. Turning to the eastward schedules from the Imperial Valley and the Salt River Valley, when was the first schedule established on Imperial Valley traffic and what was the over-all time?

A. In May, 1918, an over-all time of 160 hours with no run-off.

Q. Was that from Yuma?

A. From Yuma, yes.

Q. To what point?

A. Chicago.

Q. Was that reduced in 1921?

A. Yes, that was reduced to 145 hours.

Q. When was the next reduction?

A. In May 1927, it was reduced to 134 hours and 30 minutes.

Q. Was it reduced again in May, 1929?

A. Yes, reduced to 127 hours and 30 minutes and provided a three-hour-and-30-minute run-off.

Q. When was the next reduction?

[fol. 2370] A. In September, 1935, it was reduced to 121 hours with the same run-off and in 1937 it was raised thirty minutes and provided a six-hour run-off. In December, 1937, the present schedule was adopted, which is 109 hours and 30 minutes with a six-hour run-off.

Q. Is there any provision for a later cut-off time on account of pre-cooling of traffic concentrating at Yuma?

A. Yes, Imperial Valley and Yuma traffic, we allow it to 2 A. M. to pre-cool it.

Q. When was the first schedule made effective on Salt River Valley traffic?

[fol. 2371] Q. When did that take place?

A. In March, 1927.

Q. Did you make a further reduction in December of the same year?

A. In December, 1927, it was reduced to 124 hours.

Q. What further reductions were made after that time?

A. In June, 1928, they were reduced to 123 hours; in May, 1929, to 115 hours and 30 minutes; in May, 1930,

to 11 hours and 30 minutes; in December, 1930, to 110 hours; in July, 1932, to 109 hours and 30 minutes with a three-hour run-off; in July, 1933, it was reduced to 109 hours and 30 minutes; in December, 1937, it was reduced to 95 hours and 30 minutes with a five-hour run-off.

Q. You now have a five-hour run-off on the basic schedule of 95 hours and 30 minutes?

A. Yes, sir.

Q. Do you allow additional time past the scheduled departure hour for pre-cooling of Salt River Valley traffic?

A. Yes, we allow until 2 A. M. for that traffic.

Q. Does this additional time allowance for the release of pre-cooled traffic have any effect of cutting down the actual [fol. 2372] time allowed for the transportation?

A. Yes, it does. Where this traffic is produced, of course it is not a very long distance from Phoenix, but at the same time when the shippers take full advantage of the 2 A. M. pre-cooling it takes from two to three to four hours to bring that traffic into Phoenix, ice it, and assemble it, and depart from Phoenix. It brings it to 5 or 6 A. M. departure of pre-cooled traffic during the peak season.

Q. Does the pre-cooling allowance on traffic concentrating at Yuma have any similar effect?

A. Yes, it has a similar effect.

Q. What about the pre-cooling allowance of traffic concentrating at Colton?

A. It has the same effect also, that is the reason why we have a much longer run-off time.

Q. I think you referred to manifest schedules westward. Do you also have eastward manifest schedules?

A. Yes, we have eastward manifest schedules but all of our manifest traffic is moved in perishable trains. It is a very rare occasion where we will operate a train identified wholly as an eastern manifest train.

Q. Does eastward manifest obtain the same movement, [fol. 2373] generally speaking, as eastward perishable?

A. Yes, they do.

Q. As to your west manifest schedules, when was the first schedule established on west manifest from Chicago to Pacific Coast lines?

A. I have a record back to November, 1918, a schedule of 226 hours. I have one in December, 1917, between Chicago and San Francisco, which provided a schedule of 218 hours and 30 minutes. In November, 1918, a schedule of

226 hours was established for traffic between Chicago and Los Angeles.

Q. Has that Chicago-Los Angeles schedule of 226 hours been reduced at various times since?

A. Yes, sir.

Q. Will you state the dates of the reductions and the over-all hours?

A. In March, 1926, between Chicago and Los Angeles the schedule was reduced to 198 hours and 25 minutes; in May, 1928, it was reduced to 162 hours, and on Chicago to San Francisco traffic in the same year it was reduced from 248 hours and 30 minutes to 161 hours and 30 minutes; in June, 1929, the Chicago-Los Angeles schedule was reduced to 137 hours and 45 minutes, and the Chicago-San Francisco schedule to 141 hours; in November, 1930, the Chicago-Los Angeles schedule was reduced to 134 hours and 15 minutes; [fol. 2374] in July, 1933, the Chicago-San Francisco schedule was increased one hour over the schedule of 141 hours that was in effect in June, 1929, and was increased to 142 hours; in February, 1934, the Chicago-Los Angeles schedule was increased one hour; in April, 1935, it was reduced to 134 hours; in November, 1935, it was reduced to 110 hours and the Chicago-San Francisco schedule was reduced to 118 hours.

Q. That was a twenty-four-hour reduction in each one at that time, was it?

A. Yes, in June, 1939, the Chicago-Los Angeles schedule was reduced one hour to 109 hours and in September, 1940, the Chicago San Francisco schedule was changed, reduced to 112 hours and 30 minutes; on June 3, 1940, we set up a schedule of sixth-morning delivery, Chicago to Los Angeles, and Chicago to San Francisco, which put the traffic from Chicago to both areas on a parity, although the over-all schedule may differ a few hours but the delivery time of 7 A. M. sixth morning is the same.

Q. Where perishable moves from concentration points that you have named, do you have any means of grouping or identifying the perishable cars as they move?

[fol. 2375] A. Yes, each concentration point's traffic is identified with a symbol.

Q. What is the symbol used for traffic originating at Yuma?

A. [illegible]

Q. At Colton?

A. "C."

Q. At Phoenix?

A. "A."

Q. "A" for what?

A. Arizona perishable.

Q. Besides that letter symbol do you use any other numerical symbol?

A. Yes, we start in the first day of the year and number the blocks consecutively throughout the year.

Q. Of what does a block consist?

A. It consists of the perishable traffic that is concentrated at that point and leaving on the basic schedule day of departure.

Q. Does that mean all cars that move on a particular day receive the same block number?

A. No.

Q. How many cars are there in a block?

A. There can be any number, two cars or one hundred cars.

[fol. 2376] Q. Does a block ever include more than 100 cars normally?

A. Quite often they do, yes.

Q. Do I understand that a block is all the cars moving in one particular train?

A. In one unit, each unit operated from concentration point is identified with one number and another following it is given the next number.

Q. Although they move on the same day?

A. Yes.

Q. What will be the identification block number of a group of cars moving from Yuma, what will it read like then?

A. For the first train operating out of Yuma on January 1st it will be "Y-1." That would be the identification of the train then and that identification is carried through to Chicago and Kansas City.

Q. Does the same apply on traffic originating at Colton?

A. Yes.

Q. And the first one would be "C-1"?

A. Yes.

Q. And so on to the end of the year?

A. That is right.

Q. What use do you make of that block identification [fol. 2377] number?

A. That is in order that proper records may be made. The chief dispatcher on a division issues what we call a morning train report and on this train report he refers to these trains by their symbol or identification and then that information is recorded in proper records in our office at San Francisco.

Q. Do you record the times that these blocks make at various terminals en route by block number?

A. Yes.

Q. Do you maintain a permanent record of their movement by block number?

A. We do.

Q. Is there any permanent record of their arrival at destination maintained in the same way?

A. Yes, that is made by the Pacific Fruit Express Company, who furnish us a weekly report showing the arrival of various block numbers at the various destinations, showing the amount of time ahead or late.

Q. Do you give any information to the shippers or owners of this perishable freight as to the movement of their particular shipment?

A. Yes, the Pacific Fruit Express, when the traffic leaves [fol. 2378] the concentration points, wires the block number and the number of cars giving the initial, car number, shipper, destination, icing instructions, and so forth, to all principal P. F. E. and off-line Southern Pacific agents in the East, such as Denver, Chicago, and Kansas City.

Q. Is the same information given to the agents in origin territory, too?

A. Yes.

Q. You say you have gotten this information to the agents or the carrier agents. What is done with it, if you know?

A. The information is given to the shippers.

Q. Or receivers?

A. Receivers, I should say.

Q. Do cars, for example, which are billed out of Colton or Yuma to Chicago as a destination always move to the billed destination?

A. Oh, no.

Q. What happens to them?

A. Cars are diverted enroute by the shippers or the owners of the cars, whoever it may be. It may be the shipper

may still own the car or if it is sold to someone in the East the receiver in the East may change the destination.

Q. How do they go about to change the destination?

[fol. 2379] A. The shipper or owner of the car who wishes to divert the car files what they call a "diversion" with the Pacific Fruit Express or any of our Southern Pacific agents.

Q. Are you familiar with those diversions yourself?

A. Yes.

Q. What happens then?

A. The P. F. E. then issues instructions, they know where this car is because it is operating on a certain block. They have the record in which the block is operating and if the car is due into El Paso at 7 A. M. on the fifth day of the month and they can catch it at El Paso they generally place the diversion at El Paso or they may place it at Tucson if they can do so in time to catch the car before it departs.

Q. Will that change the waybilling of the diverted car?

A. Yes, they change the heading, that is, the destination, or they may change the icing instructions enroute.

Q. Is El Paso a point at which many diversions are actually performed?

A. Yes, there are many shippers that bill their traffic to

[fol. 2380] El Paso. It is what they call "rolling traffic" which hasn't been sold or traffic that has been loaded out on a day and no sale for it and they bill it to El Paso and it is afterwards sold and they bill it for diversion after the car has departed the concentration point.

Q. Have you when you were agent at Yuma actually received such diversions?

A. Very many, yes.

Q. And yourself undertaken to wire them ahead so as to catch the cars?

A. No, at Yuma we have a P. F. E. agent and I transmitted this information to the P. F. E. agent at Yuma who took care of the actual diversion.

Q. Do you know and, if so, will you state whether diversions are of frequent occurrence in proportion to the traffic handled? Do they average as much as one per car or one for every other car or in about what proportion do they occur?

A. I wouldn't say in what proportion but there are many cars that are diverted.

Q. Are cars ever diverted more than once?

A. Yes, that is what I meant to state, that the cars are diverted several times before they reach their final destination.

Q. You have been agent at Yuma and chief dispatcher on the Tucson division, Mr. Baker, and in the course of your [fol. 2381] testimony here you mentioned briefly the fact that trains originating or moving from the Los Angeles division and received at Yuma were reswitched at that point. To what extent does that occur?

A. In our through perishable trains, those trains come in to Yuma all the way from seventy to one hundred or more cars and, as I stated before, it is necessary to reduce them at Yuma to the number of cars which the chief dispatcher wants to handle that is below seventy, or seventy on any east of Yuma.

Q. Are there any of these trains and, if so, in what proportion which are received from the west at Yuma which do not have to be reconsisted at Yuma?

A. There are none that do not have to be reconsisted that I remember of. Occasionally there might be a short stop train or something like that.

Q. I am referring to trains of perishable.

A. Practically all trains have to be reconsisted at Yuma.

Q. What is the primary reason for that reconsisting at Yuma?

A. The Arizona Train Limit Law.

Q. If it were not for the Arizona Train Limit Law, would [fol. 2382] reconsisting at Yuma be generally necessary on these eastward perishable trains?

A. Well, to some extent, yes, it would, but it would be a much more simple operation.

Q. Would there ever be the possibility of running trains from Yuma as they were received from the Los Angeles division?

A. Oh, yes, in a great many instances.

Q. In a great many instances, did you say?

A. Yes, sir.

Q. Will you refer for a moment to pasenger train operation. In your experience as chief dispatcher of this division and as agent at Yuma as well as assistant superintendent of transportation will you say whether or not there is any reconsisting of passenger trains at Yuma?

A. Yes, there is.

Q. For what reason?

A. In order that they may keep the train within the requirements of the Arizona Car Limit Law.

[fol. 2383]. Q. Will you by reference to example show this or state just how that occurs?

A. Well, in many cases it is necessary that, in order to—I will state it this way. At Yuma we have a standard sleeper operating between San Diego and Chicago, which moves from Yuma on Train 4, and at times it has been necessary that we handle this car on train 6 via another route through Gila instead of through Phoenix and in order to keep No. 4 within the 14 car limit.

Q. Do you ever have No. 6 come to Yuma with fourteen cars?

A. Yes.

Q. And No. 4 also arriving there with fourteen cars?

A. Yes.

Q. And your car from San Diego comes in by what route?

A. Over the San Diego route.

Q. It doesn't come in on either No. 4 or No. 6?

A. No.

Q. Comes in on a connection from San Diego?

A. Yes.

Q. Suppose No. 4 and No. 6 contain fourteen cars, what do you do with the San Diego sleeper?

A. It would be necessary then to split Train No. 4 and [fol. 2384] run two sections.

Q. Do you ever drop a car off of No. 4 and leave it at Yuma in order to handle this sleeper?

A. Deadhead equipment, yes.

Q. Suppose No. 6 comes in with fifteen or sixteen cars; what do you do with them?

A. Well, it is necessary that we split No. 6 also.

Q. Do you ever drop a coach out and run with one less coach?

A. Yes, there are times we have done that, we have crowded some of the passengers into the other coach, and taken the coach off and reduced the train.

Q. Do you know, and, if so, will you state whether any similar situation ever occurs at Lordsburg?

A. Yes.

Q. Will you cite a specific instance of recent occurrence?

A. I believe it was two weeks ago last Sunday I had a call from Tucson, we had a sixteen-car navy special operating into Lordsburg moving from some point in the East.

Q. What was its ultimate destination?

A. I am not sure, but I believe it was San Diego via [fol. 2385] Los Angeles and Santa Fe, I won't say for sure.

Q. It was a California——

A. A California train. And in setting up this operation, it was set up and approved by the Military Bureau at Washington, under whose instructions we are now working when handling troops.

Q. How many cars were on that train when it left El Paso?

A. Sixteen cars.

Q. Were they all occupied?

A. They were all occupied.

Q. How many cars were on the train when it left Lordsburg?

A. Fourteen.

Q. What happened to the occupants of the two cars?

A. It was necessary to transfer the men out of the last two cars into the other equipment and crowd them up until we got to Yuma, then we deadheaded two other tourist cars from Los Angeles to Yuma in order to take care of the men for the night ride.

Q. Have there been other examples of reconsisting [fol. 2386] trains, reconsisting passenger trains at Lordsburg?

A. Oh, yes, it happens quite often.

Q. What is the occasion or reason for such reconsistence?

Mr. Strouss: Just a minute. These general statements happen quite often; I assume you are going to have an exhibit.

Mr. Mason: Well, yes, but I wanted to lay the foundation by a witness who from his past and present experience is familiar with the situation.

A. The reason it is necessary to reconsist a train is due to the requirement of the Arizona Car-Limit Law.

Mr. Mason: The fourteen-car restriction?

A. Yes, the fourteen-car restriction.

Q. I wish you would refer again to exhibit No. 176. There is one feature of that exhibit which may require a little further explanation. I notice that the basic schedule and the run-off schedule from Colton, being those solid lines under the arrow marked "eastward" converge at Kansas City at seven P. M. on the fifth day. Does that mean that the run-off is intended to be entirely complete by the time——

A. The run-off has been accomplished.

Q. At Kansas City?

[fol. 2387] A. Yes.

Q. Now, I notice that the solid line then diverges from the other solid line and reaches St. Louis at nine P. M. on the sixth day, and Chicago at 12:30 A. M. on the seventh. What is the significance of that divergence of the solid lines after passing Kansas City?

A. Well, the line from Kansas City to St. Louis is the Rock Island route for traffic, and the line to Chicago is through direct connections to Chicago north of Kansas City.

Q. For example, this movement from Kansas City to Chicago might be Rock Island by any other Missouri River connecting line out of Kansas City?

A. Yes, might be any line. The schedule requirement applies to all Missouri River lines.

Q. I understand that the schedule from Kansas City to Chicago does not necessarily apply via St. Louis

A. No.

Q. This line from Kansas City to St. Louis may then be the Rock Island, as you stated?

A. May be, yes.

Q. Or any other connecting line across the state of Missouri?

A. Yes.

[fol. 2388] Q. Now, does the same explanation apply to the convergence of the basic Imperial Valley run-off schedules, which are shown as coming together at three P. M. on the sixth day at Kansas City?

A. Yes, that is right.

Q. And their divergence likewise?

A. That is right.

Q. Now, you have stated, I think, that these lines on the basic and run-off Colton schedule and the basic and run-off Imperial Valley schedules are those which apply for the Rock Island?

A. Yes, all these eastbound schedules I have here are figured on the Colton traffic routed via the Rock Island through the Tucumcari gateway.

Q. And these are the mileages via that gateway.

A. That is right.

Q. Will you say whether or not the same time schedules apply for traffic which originates or is concentrated at Colton and moves via the Texas-New Orleans and the Corsicana gateway, and the St. Louis Southwestern?

A. Yes, they have the same arrival and the same basic route.

Q. To St. Louis?

[fol. 2389] A. Yes.

Q. To Chicago?

A. Yes, sir.

Q. And for connection to New York or Washington?

A. That is right.

Q. Are you familiar with the concentration points on the other trunk lines in California?

A. Yes.

Q. What is the concentration point for Union Pacific traffic originating on the line formerly known as the Los Angeles and Salt Lake?

A. That is Colton.

Q. And over what route does that traffic move?

A. That is Union Pacific through Salt Lake.

Q. Salt Lake City and Council Bluffs?

A. Yes.

Q. Do you know and, if so, will you state whether that traffic makes a scheduled arrival time at Chicago similar to your Colton concentrated traffic moving via Tucumcari?

A. The schedules are identical.

Mr. Strouss: I think you have that all in.

The Court: I am wondering if there might not be a stipulation, if it be true that the operations here of the Southern [fol. 2390] Pacific with reference to all of these matters is similar to that of the other lines. The witnesses have testified, and it seems to me you are covering a lot of the

identically same ground that has heretofore been gone over.

Mr. Strouss: I will agree that the basic schedules from California east are the same over all these roads.

Mr. Mason: The only point I had in mind was that the Western Pacific concentrates at Sacramento and makes these same schedules through the Utah Gateway with its connection, and the Santa Fe makes the same schedules from San Bernardino and Bakersfield, either directly or with its connections.

Mr. Strouss: Yes.

Mr. Mason: Well, that has been testified to and I think it is undisputed. There is another matter.

Q. Are there schedules in effect from Oregon by the Nevada Lines and via the Ogden Gateway?

A. Yes, we have a perishable out of Medford Territory in southern Oregon; we handle that into Klamath Falls and then over the old Modoc line to Fernley to connect with [fol. 2391] the cut-off train from Roseville providing the same schedule as provided for in the Roseville blocks.

Mr. Strouss: When you use the term "cut-off train" you use that synonymously with "run-off"?

A. Yes, that is right.

Mr. Mason: I think that is all. There may be some more questions, but I will develop them in the morning.

The Court: The court will be at recess until tomorrow morning at ten o'clock.

(Thereupon the court stood at recess until January 16, 1941, at ten o'clock A. M.)

[fol. 2392] January 16, 1941, ten o'clock A. M.

Proceedings were resumed at this time as follows:

The Court: You may proceed.

G. C. Baker was recalled to the stand.

Mr. Mason: I may have some further testimony from Mr. Baker with regard to schedules, but it isn't ready yet to produce, Mr. Strouss, and I also intend to recall him to testify

on another topic entirely, not related to what he has so far testified to. Subject to that, if you wish to cross-examine him at this time on his schedule testimony, he is available for cross-examination.

Mr. Strouss: I just have one or two questions I might ask now to clarify one or two matters.

Cross-examination.

By Mr. Strouss:

Q. I notice yesterday in your testimony concerning the Imperial Valley Schedule that, if I understood you correctly, you said the pre-cooling time for Imperial Valley was up to two A. M.?

A. Yes.

[fol. 2393] Q. On your exhibit you show the basic schedule as beginning at ten A. M. in the morning?

A. Yes, sir.

Q. And the sixteen-hour run-off would be at four o'clock.

A. The six-hour run-off.

Q. I mean the six-hour run-off.

A. Yes.

Q. Then the pre-cooling extends beyond that to two A. M. of the next morning?

A. No, the two A. M. is allowed up to two A. M. after the day that the traffic is loaded. For example, traffic loaded on Monday in the Imperial Valley is allowed up until two A. M. Tuesday morning for pre-cooling, and that traffic is due out of Yuma on a basic schedule of ten A. M. Tuesday.

Q. Then the pre-cooling would come in ahead of the time that the basic schedule begins?

A. Oh, yes.

Q. Now, when you were talking about diversions, just what do you mean by that term? Let me just make clear my question: Does that necessarily mean that a car is cut out of a train that it is in?

A. No, a diversion—a shipper may, for example, bill a [fol. 2394] car to Chicago and he may find some better market advantage for that car at Fort Worth, and he will file diversion with the P. F. E. Company or one of our agents, and divert that car at Fort Worth, or he may have a diversion of the route, he may want it changed to a different route at El Paso; it may be originally billed Southern Pacific, Rock Island and St. Louis, and he will divert it at El Paso.

T. P., M. K. & T. or other routes, or there may be a diversion in the refrigeration.

Q. Now, you spoke yesterday about cars when they leave, say, Colton, and the waybill will be for El Paso?

A. Yes.

Q. The car has not been sold yet, but before it reaches El Paso that car is sold, say, to someone in Chicago. Now, that car, when it leaves Colton, is in a train of eastbound freight going to Chicago. All that would happen there would be that the way-bill would be changed to show the destination Chicago rather than El Paso?

A. That is correct.

Q. But that would be a diversion under the term as you use it?

A. That is right.

[fol. 2395] Mr. Strouss: That is all the questions I have.

Mr. Mason: Now, may we withdraw Mr. Baker at this time and recall him later? We will call Mr. Herbert.

W. P. Herbert was called as a witness in behalf of the defendant and being first duly sworn testified as follows:

Direct examination.

By Mr. Mason:

Q. Will you please state your name and official headquarters, Mr. Herbert?

A. W. P. Herbert, 65 Market Street, San Francisco, California.

Q. Are you employed by the Southern Pacific Company?

A. I am.

Q. In what capacity?

A. Assistant engineer, Bureau of Transportation Research, Southern Pacific Company.

Q. Is that the same Bureau of Transportation Research which was described by Mr. Sines in his testimony?

A. Yes, it is.

Q. Are you one of the regular staff of engineers in the Bureau of Transportation Research in the executive offices at the San Francisco?

A. Yes, I am.

Q. What has been your previous experience, Mr. Herbert? [fol. 2397] A. I started railroading in 1919 for a brief period in the El Paso yard as a yard clerk. That was just during the summer of 1919. My services with the Southern Pacific Company started in 1921 on the Tucson division with headquarters at Tucson, Arizona, in the engineering department. I successively served as rodman, instrument man, draftsman, general foreman of track maintenance, relief road master, and I was promoted to assistant engineer in 1927. In 1937 I entered the Bureau of Transportation Research at San Francisco.

Q. Your entire service except for the service in the yard at El Paso has been on the Tucson division?

A. Yes, it has.

Q. Up to 1937?

A. Up to 1937.

Q. And for the last three years or more with the Bureau of Transportation Research at San Francisco?

A. Yes.

Q. Are you a graduate of a technical institution?

A. I did not graduate, I attended the Texas School of Mines for three years after the World War. I entered that school through the Army.

[fol. 2398] Q. What was the character of your training at the School of Mines?

A. I majored in civil engineering.

Q. What is the scope of your duties at present as member of the engineering staff of the Bureau of Transportation Research?

A. We prepare cost studies and general transportation problems and other special studies that might be assigned. Many of these studies are required for court use or use before commissions and other regulatory bodies.

Q. Have you prepared such studies and testified to them in court or commission proceedings?

A. Yes, I have.

Q. Have you prepared certain exhibits in connection with the present case?

A. Yes, I have.

Q. I will ask you to refer, if you will, please, to a statement in one sheet entitled, "Average Cars per Freight Train versus Cost per One Thousand Gross Ton-Miles, Main and Branch Lines-Form 521, Freight Statistics, Tu-

son and Salt Lake Divisions for the Years 1937, 1938, and 1939.". Have you the sheet before you?

A. Yes, I have.

Mr. Mason: May the exhibit be marked for identification?

[fol. 2399]

The Court: It may be marked.

The Clerk: Defendant's exhibit No. 177 for identification.

Mr. Mason:

Q. Did you prepare exhibit No. 177 for identification?

A. Yes, I did.

Q. Will you state from what sources it was prepared?

A. It was prepared from the Southern Pacific Company's form 521 and its predecessor, 522.

Q. This is for the years 1937, 1938, and 1939?

A. I beg your pardon, its predecessor would not be involved here.

Q. Is that the form 521 for those two divisions which has been referred to previously as having been furnished to Mr. Strauss?

A. Yes, sir.

Q. This statement appears to relate to the individual monthly statistics as compiled. Have you the file of the form 521 for each of the months represented by the exhibit?

A. Yes, I have.

Q. Does the form 521 contain charts of this character or are these charts of your own construction?

[fol. 2400] A. Form 521 does not contain charts; it contains the averages shown hereon and the charts are of my own construction.

Q. Have the figures shown hereon been taken from the form 521 or are they computations from figures taken from the form 521?

A. They have been taken from the form 521. There are computations here and those same computations appear on 521.

Q. Let us refer, for example, to the upper lefthand block. You show an average of cars per train and an average of cost per thousand gross ton-miles. Are those averages on the 521 or are they computed by you?

A. The average for the year?

Q. Yes.

A. That average is also shown on the annual figure for the 521. That would be the average for the twelve months.

Q. I take it that every figure here appears on the 521 under an appropriate heading?

A. That is right.

Q. Has the exhibit been checked against those underlying sources to determine its correctness?

A. It has.

Q. As to the construction of the exhibit as a chart, was [fol. 2401] that of your own doing?

A. Yes.

Q. Taking again the upper lefthand block as an example, will you explain just how the chart is constructed?

A. The cars per train are shown on the right-hand side of the block, starting at the bottom at fifty each square being representative of five cars. It runs sixty, seventy, eighty, ninety, up to one hundred cars. On the lefthand side the scale is shown per cost in cents per 1000 gross ton-miles, the weight of the locomotive and tender being excluded.

Q. Do those figures represent cost per thousand gross ton-miles?

A. Cost per thousand gross ton-miles in cents.

Q. You show at the bottom of the sheet a legend, I take it that the significance is that the solid line shows the trend of the cost figures by months, is that correct?

A. That is right.

Q. And the dashed line the trend of the train lengths expressed in average cars per train?

A. That is right.

Q. Are these averages inclusive or exclusive of caboose?

A. Including caboose.

[fol. 2402] Q. Do I understand that the dashed line relates entirely to the scale which appears at the right-hand side of the block of squares in each instance?

A. That is right.

Q. And that the solid line relates to the scale which appears at the lefthand side of the block of squares?

A. Yes.

Q. How do you determine how the line shall run?

A. The lines are determined by the plotting of each individual month on the graph as shown on the 521.

Q. That is to say, you find the points at which the cost figure, for example, would fall in each successive month on the scale?

A. Yes.

Q. And then draw a line to join those points?

A. Draw a line to join those points, yes.

Q. You show at the top of the upper lefthand scale, taking that as typical, and at the top of each of the others, figures in two columns reading from the left of the sheet, one bearing the style "Cars" and the other styled "Cost (Cents)"?

A. Yes, sir.

Q. Do those figures relate to points on the chart itself?

[fol. 2403] A. Yes.

Q. Will you select one of those and point out what point on the chart it relates to?

A. Take the first point under "Cost" on the upper lefthand block which would be the first point on the solid line. It shows 58.8 in the column you just referred to and it is plotted on this chart just below "60" which represents on the scale and is plotted to 58.8.

Q. Does this portrayal by scale and line represent any condensation of any other graph or set of lines or is this entirely an original production of your own?

A. This is entirely an original production.

Q. This is not in any sense a condensed profile?

A. No, it is not, it is taken entirely from the 521.

Q. It is to be entirely distinguished from any profile?

A. Yes. I might add that each scale of each block is the same, making the relative position of the lines comparable in each instance.

Q. In the lower half you show the Salt Lake division. Is the same scale used in plotting the points for the Salt [fol. 2404] Lake division as used for plotting the points for the Tucson division?

A. Yes, sir.

Mr. Mason: There are some further explanations I expect to undertake, Mr. Strouss, but I think they had better follow the introduction of the exhibit if it is received. Have you any questions before the exhibit is offered?

Mr. Strouss: No, I have no questions.

Mr. Mason:

Q. Will you say, Mr. Herbert, whether the exhibit is true and correct to the best of your knowledge and belief?

A. It is.

Mr. Mason: We offer the exhibit in evidence as defendant's exhibit No. 177.

Mr. Strouss: It is objected to as irrelevant and immaterial, particularly the part which refers to the Salt Lake division.

The Court: Objection overruled, it may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 177.")

Mr. Mason:

Q. Mr. Herbert, I notice that you use three years. Are the years prior to 1937 available?

A. Yes, they are.

Q. Is the year 1940 available?

[fol. 2405] A. Well, it is right now; it was not available at the time I made this chart.

Q. Is there any reason for not having included years prior to 1937?

A. No, I concluded that three years were sufficient to show the picture.

Q. What is the purpose of the exhibit? To show absolute figures or to show trends?

A. Just to show trends, not absolute figures. Of course the absolute figures are there as reported in the 521.

Q. Do the figures pertain to main line operations on the divisions only or are they the result as well of branch line operations?

A. Main line and branch line operations as shown in the title.

Q. Does the exhibit include any costs or other results of passenger train operation or does it relate entirely to freight train operation.

A. Entirely to freight train operation.

Q. What items of cost are included in the cost figures shown here?

A. Fuel, enginemen wages, trainmen wages, locomotive supplies and expenses, engine house expenses, train supplies and expenses. Those are the direct train expenses.

[fol. 2406] Q. Does this include any cost for maintenance of way?

A. It does not.

Q. Does this include any cost for general or overhead?

A. No, just the direct train expenses.

The Court: Will you read the last answer of the witness as to what is included in the cost?

(The last answer was read by the reporter.)

The Witness: Instead of locomotive supplies and expenses it is "other locomotive supplies."

Mr. Mason: Are those the same items of cost for both the Tucson and the Salt Lake divisions?

A. Yes, they are.

Q. What precisely do you undertake to show here by reason of showing variations in train length and variations in unit cost per thousand gross ton-miles on the same chart?

A. I propose to illustrate and support our contention that the cost of operation per unit of performance varies inversely to the number of cars handled in train units and therefore justifies the conclusion that the lengthening of trains results in economy of operation.

Q. I notice that you use as the unit to which the cost is [fol. 2407] applied the gross ton-mile or thousand gross ton-miles, in this case, which I take it is the same thing, rather than the train-mile. As a company engaged in producing and selling transportation what does the company sell to the customer, train-miles or gross ton-miles?

A. They sell traffic expressed in gross ton-miles.

Q. Where does the train or train-mile come into the picture?

A. The train is the unit devised to convey traffic or to convey gross ton-miles.

Q. What is it that the company finally produces?

A. We produce the gross ton-mile or the car-miles.

Q. Is the car-mile similar to the gross ton-mile?

A. Yes, it is interrelated. We haul either light cars or heavy cars but the gross ton-mile is the most important unit in measuring cost.

Q. Is the gross ton-mile relatively constant and invariable as a measure of performance?

A. Yes, it is.

Q. What factors are there, if any, which produce a variation in the gross ton-mile, comparing one gross ton-mile [fol. 2408] as against another? If you transport a gross ton-mile over a grade of 2.2 per cent, over a mile having a grade of 2.2 ascending, and another over a mile having no grade at all, being completely level, would there be any variation as between those two gross ton-miles?

A. No, they would still be gross ton-miles.

Q. Would there be any variation in expense as between them? Would it cost more to produce the gross ton-mile on the ascending grade than to produce the gross ton-mile on the level?

A. I believe it would a little.

Q. Is there any other element which might produce a variation as between gross ton-miles?

A. I don't know just what you mean by "variation."

Q. Not all gross ton-miles are the same, are they?

A. No, the gross ton-mile is the gross tonnage that is hauled.

Q. Times the miles over which it is hauled?

A. Yes.

Q. And to the extent that those miles differ, one mile as against another mile, there would be a variation in gross ton-miles?

A. Yes, there would be a variation as to the distance.

[fol. 2409] Q. Would there be a variation as to the distance?

A. The distance would cause a variation in the gross ton-miles.

Q. It would cause more or less of them, yes, but isn't there a difference in the cost per gross ton-mile depending upon the character of the mile traversed, not the number of miles but the character of the miles traversed?

A. Yes, there would be a little difference.

Q. Is there a difference between train-miles, comparing one train mile against another train-mile?

A. There is a very slight difference, but as a rule train-mile costs are about the same in one location as another.

[fol. 2410] Q. You mean the average train-mile cost?

A. The average train-mile cost.

Q. But I am speaking of actual train-miles, not the average. Let us get away from the average for a moment. Now, are there factors associated with trains, that will cause any variation in train-miles so as to render that unit inconstant or is that always a constant unit? Well, perhaps my question isn't quite clear. Do trains vary in length?

A. Yes.

Q. From what to what?

A. Well, they will range from no cars to seventy cars in Arizona, and hundred cars or so in other states.

Q. May they even go as high as a hundred and fifty cars?

A. A hundred and fifty or a hundred and sixty cars.

Q. The movement of a train of 160 cars for one mile is a train-mile, is it?

A. Yes.

Q. And likewise the movement of an engine with caboose?

A. Yes.

Q. And the movement of a train consisting of an engine [fol. 2411] and caboose over a level or descending mile is still a train-mile, isn't it?

A. Yes.

Q. And the movement of a 160-car train up a two per cent grade, if it was moved, is still a train-mile?

A. Yes.

Q. Are there any variations, then, in train-miles which would render the train-mile an inconstant unit?

A. Yes, I see what you mean. The length of the train would be a factor.

Q. Are there variations of load as between trains of the same length?

A. Yes.

Q. Would that be a further factor inducing a variation?

A. Yes, sir.

Q. Do those variations of length and loading produce or enter into the picture where the gross ton-mile is considered?

A. No, they do not.

Q. How does the car-mile compare with the gross ton-mile as a measure of performance?

A. The car-mile is fairly constant.

Q. How does it compare with a train-mile as a measure [fol. 2412] of performance from the standpoint of variability?

A. It is more constant than a train-mile.

Q. Is the car-mile in any sense a measure of the output of the company?

A. Well, not as much so as the gross ton-mile. The car-mile is a measure of traffic or the density of traffic.

Q. I notice by referring to Exhibit 177, Mr. Herbert, that the cost on the Tucson division per thousand gross ton-miles appears to fluctuate within comparatively narrow limits, whereas, on the Salt Lake division the cost appears to fluctuate somewhat more widely. Can you ex-

plain by reference to the showing on the exhibit how that comes about?

A. Yes; that is due to a wider fluctuation, or a more violent fluctuation on the Salt Lake division in cars per train throughout the year, whereas, on the Tucson division, due to restrictions in the length of the train, the fluctuation in average cars per train is very mild.

Q. Have you an illustration of the fluctuation of cost upward or downward between wide limits on any one of these charts for the Salt Lake division?

[fol. 2413] A. Well, you can take any year, either 1937, 1938, or 1939; take the 1938, the month of August, on the Salt Lake division the average cars per train reached its peak at that month, and you will note that the cost expressed per unit of a thousand gross ton miles was at a low level. On the Tucson division, the same relation exists, but there is not the opportunity to make the economies on the Tucson division that there is on the Salt Lake division because of the restricted length of the trains.

Mr. Strouss: I move to strike that last statement as a conclusion.

Mr. Mason: I think that that is a proper inference to be drawn from the exhibit, and from the fact that the restriction does exist. The restriction certainly is not disputed.

The Court: The motion to strike will be denied.

Mr. Mason: Without undertaking to force cross-examination now, Mr. Strouss, are there any questions you would like to ask before we pass from No. 177?

Mr. Strouss: There is one question.

Q. When do costs begin to accrue against tonnage? For example, suppose that a carload of cattle is delivered [fol. 2414] to the Company for transportation, when do the costs begin to accrue on that; when the crew goes to pick that car up?

A. The train-mile as reflected here, you mean?

Q. Yes, this cost you are talking about here, cost per gross ton-mile.

A. When the car enters the train, these are costs for freight train operations expressed in the units of a thousand gross ton-miles, so when the car is in the train is when the costs begin to accrue.

Q. Your costs in picking up a car are not included in these costs?

A. Sir?

Q. The costs of picking up a car of freight are not included in these costs here?

A. No—well, I believe they would. Train expenses would be involved in the picking up of a car if it was at a way-point, but in the terminal it wouldn't.

Q. Take the situation in the Salt River Valley where you pick up citrus and melons and lettuce during the season when those products are being shipped, you have a crew there almost continually, don't you, going out toward Chandler and Mesa?

A. Yes, we have what we call roustabout service.

[fol. 2415] Q. Is that cost included?

A. In this exhibit?

Q. Yes, as part of your——

A. Yes, it is freight train cost, local as well as through trains.

Mr. Strouss: That is all.

Mr. Mason: Would the cost of placing the empty car for the loading of the stock, if performed by a freight train crew, be included here?

A. Yes.

Q. And the cost of switching the car into the train, if performed by the freight-train crew, would be included?

A. Yes.

Q. And the fuel of the locomotive, while performing the switching operation at the way-side point?

A. Yes, sir.

Q. Will you now turn to a statement in one sheet entitled "Main and Branch Line Freight Train Comparisons, Tucson and Salt Lake Divisions, and Pacific Lines, Cars per Train, Gross Ton-Miles per Train-Mile, Cost per One Thousand Gross Ton-Miles," being in one sheet. Have you that before you?

A. Yes, I have.

[fol. 2416] Mr. Mason: May we have it marked 178, if your Honor please.

The Court: It may be marked.

The Clerk: Defendant's Exhibit No. 178 for identification.

Mr. Mason: From what source was Exhibit 178 prepared, Mr. Herbert?

A. From Form 521.

Q. Did you prepare it personally?

A. I did.

Q. Are these the annual 521's for the years indicated on the face of the exhibit?

A. Yes, these are the annual figures.

Q. Are the figures taken directly from the 521?

A. They are.

Q. And placed on the exhibit in the various columns and segregations as indicated?

A. Yes.

Q. The charts, I take it, are of your own construction?

A. Yes, they are.

Q. And were prepared, or, rather, drawn after locating the points in the same manner as you explained for No. 177?

A. That is right.

[fol. 2417] Q. Are there any computations on the exhibit?

A. All of the averages shown are computations but those computations do appear on Form 521.

Q. Are there any computations of your own on the exhibit as distinct from those which are necessary for the purposes of Form 521?

A. No, there are not.

Q. Now, you show at the left-hand side of each of these blocks a scale. Is that scale associated entirely with that particular block?

A. Yes, it is.

Q. Does the scale of the top block have anything to do with the scales on either of the other two?

A. No, it does not.

Q. There are three separate scales, are there?

A. Three separate scales on this exhibit.

Q. What do you undertake to indicate by the top graph?

A. The top graph shows average cars per train, including cabooses, Salt Lake division, Tucson division, and the Pacific Lines, for each of the years 1924 to 1939, inclusive.

Q. And the trend of the average train length?

A. It is intended to show the trend of the average length throughout these years.

[fol. 2418] Q. Now, the second or center chart.

A. The second chart or center block shows for the same territories, that is, the Salt Lake division, Tucson division, and Pacific Lines, the gross ton-miles per train-mile, excluding the weight of the locomotive and tender, and likewise shows a similar trend throughout those years, 1924 to 1939, inclusive. It is very closely related, of course, with the upper block.

Q. Now, the third chart undertakes to show what?

A. The third chart shows in cents the cost per thousand gross ton-miles, also excluding locomotive and tender.

Q. And what items are included in these costs?

A. The same items as I explained for the previous exhibit, No. 177.

Q. The so-called direct expenses of train operation?

A. Yes.

Q. Will you say whether or not the exhibit is true and correct in so far as it reflects the underlying figures on the forms 521?

A. To the best of my knowledge and belief, it is.

Q. Are the forms 521 for each of these years available [fol. 2419] here in the city or in the court room?

A. Yes. I might say here that prior to 1928 it was form 522, the predecessor of form 521. We also have those forms here in the court room.

Q. Does that carry the same information?

A. The same information, about the same information. It carries the same information, yes.

Q. I mean, in so far as this exhibit is concerned?

A. Yes.

Mr. Mason: Have you any questions on the exhibit, Mr. Strouss?

Mr. Strouss: The Tucson division, during all of this period, included here, did not include the same territory at all times?

A. No. In, I think it was, August, 1930, the Tucson division was extended from Tucson to Lordsburg.

Q. Of course, this begins after the acquisition of the E. P. and S. W. and the Arizona Eastern?

A. Yes; the year 1924 shown here was restated on form 522 in 1925, so it is comparable to 1925.

Q. Now, these figures include both main and branch?

A. Yes, they do.

[fol. 2420] Q. And, so far as the Salt Lake and Tucson divisions are concerned, they are the same figures as Mr. Masson referred to in his testimony yesterday or the day before?

A. I don't—— If he referred to main and branch, they are.

Mr. Mason: I think we will both agree there have been some variations in the relationship and the total of main and branch line mileages over both divisions during those years, the 1931 figures being those which Mr. Masson——

Mr. Strouss: (Interrupting) He gave me 1931 for main line operations.

Q. Since 1931, you haven't broken down your costs, you don't show them as to main and branch lines?

A. That is right. That is why they cannot be made that way and be consistent throughout the years.

Mr. Strouss: That is all.

Mr. Mason: I will offer the exhibit as No. 178.

The Court: Any objection, Mr. Strouss?

Mr. Strouss: Yes.

The Court: The objection is overruled. It may be admitted.

[fol. 2421] (The document referred to was received in evidence and marked "Defendant's Exhibit No. 178.")

The Court: The court will be at recess until one-thirty.

(Thereupon, the court stood at recess until one-thirty o'clock this day.)

[fol. 2422] January 16, 1941, 1:30 o'clock P. M.

Proceedings were resumed at this time as follows:

The Court: You may proceed.

The witness, W. P. Herbert, was recalled to the stand and testified further as follows:

Mr. Mason: Referring to Exhibit 177, Mr. Herbert, and having in mind as well the preceding exhibit, I think that you stated this morning in your direct examination, that

the gross ton-mile as a measure of performance is relatively invariable, and that the train-mile as a measure of performance is variable. Now, I will ask you whether cost per train-mile on a particular district is a flexible or inflexible cost?

A. Cost per train-mile is inflexible, relatively.

Q. Why is that?

A. Well, you get a train on the road, there are certain costs that are incurred that would go on whether the train is long or short. For instance, you have wages of trainmen, enginemen, locomotive repairs, train supplies and expenses. However, your fuel will vary a little with the long or short train.

[fol. 2423] Q. Does it vary in proportion to the length of the train?

A. No, it will not.

Q. A light locomotive will consume considerable fuel?

A. Yes.

Q. That locomotive attached to a train will of course consume additional fuel?

A. Additional fuel, yes.

Q. Then, is it possible to vary the cost per train-mile by varying the length of the train to any considerable degree, that is, to vary the cost to any considerable degree?

A. No, it doesn't vary the cost per train-mile to any considerable degree.

Q. How do you produce gross ton-miles, Mr. Herbert? How does the Company produce gross ton-miles?

A. Well, by adding——

Q. No, I mean, how are they produced in the first instance?

A. Well, they are the tons multiplied by the miles traveled.

Q. Are they produced by the operation of trains?

A. Yes, they are produced by the operation of trains.

[fol. 2424] Q. Do trains vary in productiveness of gross ton-miles?

A. Yes.

Q. What causes the variation?

A. Well, the long or short train, in the first instance, there will be heavy cars and light cars, the more tons you have in a car, and then the more cars, in turn, you have in a train, the more gross tons you will have in a train. Expressing it in gross ton-miles, a train running so many miles

will produce so many more gross ton-miles with heavy cars and more cars per train.

Q. If a train is shorter in length relatively the gross tons will be less by the same token?

A. Yes.

Q. Is it possible to vary the cost per gross ton-mile and, in connection with this question, I recall to your mind the fact that this morning you testified that the gross ton-mile is itself a relatively invariable unit, but as to the cost per gross ton-mile, is it possible to vary that?

A. Yes.

Q. And how is that accomplished?

A. That is accomplished by adding more gross tons to your train or more gross tons per car and more cars per train, which is the same thing.

[fol. 2425] Q. With a fixed train-mile cost, how do you obtain a variable gross ton-mile cost?

A. By adding more gross tons to the train unit.

Q. Or, if you raise the gross ton-mile cost, how do you do that?

A. If you have less amount of gross tons per train unit.

Q. Now, to obtain a relatively low gross ton-mile cost, then what method do you pursue?

A. By having longer trains, expressed in cars.

Q. Where you have a fixed limit which you cannot exceed, Mr. Herbert, is it possible to obtain the same result in reducing gross ton-mile cost as where there are no such limits?

A. No, it is not possible.

[fol. 2426] Mr. Mason: Will you say whether your exhibits 177 and 178 just received indicate whether gross ton-mile costs do vary contemporaneously with variation in number of cars per train?

A. Yes, they do.

Q. Will you point to some examples of that?

A. The Salt Lake division cars per train as you will note in the upper graph shown on exhibit No. 178, the upper graph shown by the solid line, the cars per train have trended upward since 1924, whereas the costs per unit of thousand gross ton-miles as reflected by the solid line on the lower graph have trended downward over the same period.

Q. You spoke of longer trains as being a manner whereby each train-mile could be made more productive. Do you

have an illustration of the greater productive value of a train-mile expressed in gross ton-miles on exhibit No. 178?

A. Yes, that is shown by the middle graph. By the same token, taking the Salt Lake division for an example where such economies can be effected or such loadings can be effected due to the unrestricted territory with respect to cars per train, there you will see that the average gross tons per train have trended upward in about the same proportion that the cars per train have trended upward over the [fol. 2427] same period of time.

Q. I notice that the showing of average cars per train and gross ton-miles per train mile is less on the Pacific lines than on the Tucson division, year by year. What is the explanation of that fact?

A. That is due principally to the greater amount of local service in other divisions, that is, other than the Tucson and Salt Lake divisions, particularly the west coast divisions.

Q. Does branch line service enter into the picture at all?

A. Yes, branch line service has some effect.

Q. Is branch line and local service predominantly a short train operation?

A. Branch line is. Local service is usually a short train operation, a short run and a short train operation.

Q. Will you say whether the purpose of this exhibit is somewhat the same as exhibit No. 177?

A. Yes, it is, the only difference being that it shows it by years where the other exhibit, No. 177, shows the similar trends for each month of the year.

Q. This covers, as I see it, some sixteen years, does it not?

[fol. 2428] A. Yes, sir, 1924 to 1939, inclusive. There is one point I would like to bring out on this exhibit No. 178 and that is that the last three items in the gross tons per train-mile, the last four years, 1936, 1937, 1938, and 1939, I used an actual computation there rather than the figures shown in the 521 because in the 521, starting in 1936, the light train-miles were eliminated. In a graph of this kind I figured it was better to have the graph continuous one year as exactly related with the other, so therefore I made the actual computation.

Q. You added in the light train-miles before making the division?

A. Yes, sir.

Q. Is the figure representing gross ton-miles per train-mile sometimes referred to as "gross tons per train"?

A. Yes, it is the same thing.

Mr. Mason: I propose now to go to another exhibit, Mr. Strouss, unless you have some questions on exhibit No. 178?

Mr. Strouss: I want to have the 522's before I examine on this.

Mr. Mason: They will be furnished.

Q. Have you before you, Mr. Herbert, an exhibit in four [fol. 2429] sheets bearing the title on the first sheet; "Comparisons between Tucson Division, Pacific Lines, and Salt Lake Division Showing Trends in Freight Train Lengths and Freight Train Loading, and Effect on Operating Costs"?

A. Yes, I have.

Mr. Mason: May we have the statement marked "Defendant's Exhibit No. 179" for identification?

The Court: It may be marked.

The Clerk: Defendant's exhibit No. 179 for identification.

Mr. Mason:

Q. Did you prepare exhibit No. 179?

A. Yes, I did.

Q. From what sources?

A. It was prepared also from the 521, the company's form 521, "Operating Statistics."

Q. Was form 522 used for earlier years?

A. Yes, 522 for years 1924 to 1927, inclusive.

Q. Is this exhibit a companion to one of the preceding exhibits?

A. It is a companion to exhibit No. 178.

Q. Will you explain what the first sheet of the exhibit is with relation to the other three?

A. Sheet 1 is a summary of the three back sheets. It shows the Tucson division Pacific lines, the Salt Lake [fol. 2430] division, percentage increase in cars per train, percentage increase in gross ton-miles per train-mile, and percentage decrease in costs in cents per thousand gross ton-miles for each of those three districts divided into two groups, period groups. The first group, 1924-1925, com-

pared with 1928-1929; the second group being 1930-1931 compared with 1938-1939. Percentages shown are the total percentage change for the two groups.

Q. Are these calculations the results of which appear on sheet 1 shown in greater detail on the succeeding sheets?

A. Yes, sir.

Q. I will ask you if the figures in column B are figures taken from the 521 and 522 forms?

A. Yes, they are.

Q. And the same as to column C?

A. Yes.

Q. Column D?

A. Yes.

Q. And column E?

A. Yes.

Q. How do you obtain column F, is that a computation from the preceding figures or is that also on the 521?

A. That is a computation and also appears on the 521.

[fol. 2431] Q. Does it express a division?

A. Yes, it does.

Q. What two figures are divided?

A. Car-miles in column C divided by the train-miles in column B.

Q. That gives you what?

A. Average cars per train.

Q. In column F?

A. Yes.

Q. The gross ton-miles per train-mile, how do you get that?

A. Gross ton-miles per train-mile as shown in column G are a division obtained by dividing column D, gross ton-miles, excluding locomotive and tender, expressed in thousands, divided by the train-miles, column B.

Q. That gives you the result in column G?

A. That gives you the result in column G. I might add that that same computation follows down through the years to and including 1939.

Q. Are all the figures for each year where the several years are shown in the upper block of the exhibit obtained in the same fashion that you have described for 1924?

A. Yes.

[fol. 2432] Q. As to column H, is that also a division?

A. Yes, it is.

Q. Of what two columns?

A. It is a division of freight train cost as shown in column E divided by the gross ton-miles as shown in column D.

Q. And expressed in cents per thousand?

A. Expressed in cents per thousand gross ton-miles.

Q. And these expenses included in freight train costs, are they the same as the expenses you referred to in connection with exhibits Nos. 177 and 178?

A. Yes, they are.

Q. What have you done in the line designated as "Total 1924-1925"?

A. I am looking at the Tucson division, sheet No. 2, 1924-1925.

Q. Did you add those years together to get the result?

A. I added those two years together to get the result of those two years and the same averages are shown there for those two years as are shown for any individual year above, the same computation.

Q. As the averages obtained by computation?

A. Yes, the same type of computation.

[fol. 2433] Q. The same way for 1928-1929?

A. Yes.

Q. There is one figure that appears to be indistinct on my copy and it may have been rendered indistinct in reproduction. In line 2425, column F, it appears to be 54.6. Is that correct?

A. It is indistinct here but I am very sure that is correct. I will have it checked, however.

[fol. 2434] The Court: Mr. Herbert, let me get that straight. On those totals for 1924 and 1925, those are the actual totals for those two years, and not an average for the two years?

A. The totals are the actual totals, yes, sir.

Q. Not an average?

A. No.

Mr. Mason: But, of course, when we get into the column headed "Cars Per Train," or the column G, "Gross Tons per Train Mile," those are computed averages there?

A. Those are computed averages there. The last three columns on this sheet are computed averages where aver-

ages are shown, but the totals as shown for the two years 1924-1925 are actual totals.

The Court: I see.

Mr. Mason: Now, in getting the line headed "Per Cent Change Two Years 1924-25," and so forth, did you make the computations there?

A. Yes.

Q. By subtracting the lesser figure from the greater, and dividing the difference by the greater figure?

A. That is right.

Q. The same process was followed in getting the totals [fol. 2435] and the percentage changes for the lower block 1930-31 and 1938-39?

A. That is right.

Q. Now, what is the derivation of the figures in the line stated as "Total Per Cent Change For the Two Periods Compared?"

A. That is the total decrease of the last period compared with the first two periods.

Q. Now, in column G, gross ton-miles per train-mile, there appears to have been an increase, at least the figure "D" is not used. How is that obtained?

A. Well, that is obtained because the 58.4 as shown for 1938-39 is higher than the figure 57.8 as expressed in cars per train for the period 1930-31.

Q. In other words, you subtracted the smaller percentage from the larger, and the balance was the decrease?

A. Yes, sir.

Q. And in the next column, column G, you subtracted the decrease from the increase and had a net increase; is that the idea?

A. Yes.

Q. Then, in column H there was a large decrease in one [fol. 2436] period, and a small increase in the other, so you obtained a net decrease, is that the idea?

A. Yes.

Q. Now, turning to sheet 3, Pacific Lines, are the computations and percentage changes computations made in the same manner?

A. They are.

Q. And does the same explanation also apply to sheet 4?

A. Yes.

Q. On sheet 3, I notice that the percent change in each of columns F, G, and H, for the first period compared, or the second period compared, is all in the same direction, that is, there seems to have been increases in cars per train and the gross ton-miles per train-mile, but a decrease in the unit cost. How did you obtain the figures for the total per cent change? Is that a straight addition?

A. That is a straight addition, yes, sir.

Q. Then these figures on sheet 2 are obtained by algebraic additions, are they?

A. Yes.

Q. Now, are these straight additions on sheet 4 in your percentage change figures?

A. Yes, they are again straight additions.

[fol. 2437] Q. Now, are these figures in columns F, G and H the same figures which are used in plotting the trend lines shown on exhibit No. 178?

A. Yes, where I show the actual figures for the individual years.

Q. Now, what figures have you brought forward from sheets 2, 3, and 4, to make the showing on sheet 1?

A. I brought forward from sheets 2, 3, and 4, the last three figures at the foot of the columns F, G, and H. In other words, for the Tucson division, you will notice the first item on sheet 1 is a decrease of 0.43, which appears at the foot of sheet 2, column F; the next figure is percentage increase in gross ton-miles per train-mile, Tucson division, 3.95 per cent, that appears at the foot of column G in sheet 2. The next figure is decrease of 15.93, a percentage decrease in cost per thousand gross ton-miles. That appears at the foot of column H on sheet 2.

Q. And the same would apply to columns B and C on sheet 1?

A. Yes.

Q. Now, I notice that you compare 1928-29 with 1924-25, and then compare 1938-39 with 1930-31. Why do you have [fol. 2438] that break, so to speak, in your comparison? I am referring now to sheets 2, 3 and 4.

A. Because the Tucson division changed its limits in 1930; therefore, I chose to compare a period before that change and compare a period subsequent to that change, averaging the two periods by taking two-year groups at the head and at the end of each of those two groups. 1931, in

521 statistics, has 1930 restated, so I was able to show 1930 as though it had had the same operating conditions prevailing as in '31.

Q. The same operating limits of the division?

A. Yes.

Q. Why was the same showing or the same break in comparison made in sheets 3 and 4?

A. Well, in order to have them all the same, to have them comparable, I chose to have them all figured on the same basis.

Q. Does your exhibit No. 179 show any direct or inverse relationship as between average train lengths or average train loading expressed in gross tons per train on the one hand, and costs per thousand gross ton-miles on the other?

A. Yes.

Q. What is that relationship?

A. Well, you will note that on the Salt Lake division, for [fol. 2439] instance, the percentage increase, increase per train is 30.61.

Mr. Mason: I guess I haven't offered the exhibit, so I am a little ahead of my time in asking that question. I will ask that you suspend your answer to the question. Has the exhibit been compared, Mr. Herbert?

A. For correctness?

Q. Yes.

A. Yes, it has.

Q. Have the computations been checked?

A. Yes, they have.

Q. Will you say whether or not the exhibit is true and correct to the best of your knowledge and belief?

A. Yes, I believe it to be.

Mr. Mason: Have you any questions, Mr. Strouss?

Mr. Strouss: No, I haven't.

Mr. Mason: I offer this exhibit in evidence as 179.

Mr. Strouss: I object to it as irrelevant and immaterial.

The Court: The objection will be overruled. It may be admitted.

Mr. Strouss: I do notice that on the second, third, and fourth pages you refer to main and branch. What appears [fol. 2440] on the first page, also is main line and branch?

A. Yes, that is right.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 179.")

Mr. Mason: Now, I think that my question, addressed to you just before I offered the exhibit, was a request to state the relationship, inverse or direct, as between the items I mentioned. Will you please answer that question?

A. You will notice that—I think the answer was "Yes," on that. I think I answered it before.

Q. You said you discovered a relationship, and I ask you to state what it is.

A. On the Salt Lake division, there is a percentage increase in cars per train of 30.61 per cent, and the percentage increase in gross ton-miles per train-mile is 35.42 per cent, whereas the percentage decrease in cost per thousand gross ton-miles as expressed in cents is 27.72 per cent; and looking again at the Tucson division, you will find that the percentage increase in cars per train instead of being an increase is a decrease of 0.43 per cent—with only a 3.95 increase in gross ton-miles per train.

The Court: But in spite of that fact, you were successful [fol. 2441] on the Tucson division in decreasing your costs on a percentage basis 15.93?

A. Yes, that is right; and we were also able to increase our loading a slight amount, which is expressed by that 3.95 per cent.

Mr. Mason: The increase in gross ton-miles per train-miles as to the Tucson division, in the absence of the increase in train length, is accomplished in what way?

A. It is accomplished principally by loading the cars heavier.

The Court: There is a limit beyond which that can't go, I presume?

A. Well, yes. Certain cars are limited to certain weight restrictions and capacities.

Mr. Mason: I notice that your showing goes back to the year 1924. I will ask you to refer to the Salt Lake division showing on sheet 4: in that year the average cars per train on the Salt Lake division is 51.6?

A. Yes.

Q. Will you say whether or not the year 1924 was prior to the institution of long train operation on the Salt Lake division?

A. Yes, it started in about 1925, it had its full effect, started to have its effect in 1925.

[fol. 2442] Q. There were, as I think your exhibit shows, continuing increases in average cars per train after 1925 and for several years. What do those indicate?

A. On the Salt Lake division?

Q. Yes.

A. It indicates that the long train program is having its effect in the later years by hauling longer trains.

Mr. Mason: Have you any questions, Mr. Strouss, before we pass from Exhibit 179?

Mr. Strouss: No, not at present.

Mr. Mason: Have you before you a statement in one sheet consisting of a series of charts and bearing in the lower right-hand corner "Southern Pacific Company, Pacific Lines, Statistics of Main Line Operations, Tucson Division Compared with Salt Lake Division, and Pacific Lines, Years 1920-1939, Inclusive?"

A. Yes, I have.

Mr. Mason: May we have this statement marked Defendant's Exhibit No. 180?

The Court: It may be marked.

The Clerk: Defendant's Exhibit No. 180 for identification?

Mr. Mason: Did you prepare Exhibit No. 180 for identifi-

[fol. 2443] cation, or cause it to be prepared?

A. Yes, I did.

Q. And from what sources?

A. From Form 521.

Q. Was the Form 522 used for prior years?

A. And the Form 522 as predecessor prior to 1928.

Q. Now, there are certain figures which appear in typewriting in each of the three blocks of the exhibit opposite the names Tucson division, the Salt Lake division, and Pacific Lines. Are these figures actually taken from Forms 522 and 521?

A. Yes, they were.

Q. Then, how did you make the chart shown, for example, at the top of the sheet?

A. By plotting thereon for each year shown in accordance with the scale as shown on the left side of each block, the figures as shown on the top of the block representing Tucson and Salt Lake divisions, and Pacific Lines. The Salt Lake division is shown by a solid line on each of the three blocks; the Tucson division by a dash line, and the Pacific Lines by a dotted line.

Q. Are the lines drawn so as to join the plotted points?

A. Yes.

[fol. 2444] Q. You determined the lines after you determined the points, is that it?

A. That is right.

Q. Do I understand that this exhibit relates entirely to main-line operations?

A. Main line only.

Q. What does the exhibit in miles per hour indicate? Is that the total time over the division or the time between particular points, or how is it figured?

A. It is the total time between terminals and does not include any time at terminals.

Q. Does it include time spent by freight trains at way stations between terminals?

A. Yes, it does.

The Court: In other words, it is elapsed time?

A. Yes, elapsed time on a freight train run from one terminal to another.

Mr. Mason: The cars per trains are obtained, I think you have explained previously, by the division of car-miles by train-miles; is that true here?

A. Yes, it is true here.

Q. How did you obtain the figure of car-miles per mile of road?

[fol. 2445] A. That is the freight car-miles divided by the road-miles in freight service, and also derived from the Form 521.

Q. Do you take the total of car-miles for the year?

A. Yes.

Q. And divide by the average number of road-miles operated in freight service?

A. During that year; yes, sir.

Q. Have the figures on the exhibit been compared against the original sources?

A. Yes, they have.

Q. Are the forms 522 and 521 available for the use of opposing counsel?

A. Yes, they are.

Mr. Mason: Will you want those records, Mr. Strouss?

Mr. Strouss: I want your 522's.

Mr. Mason: For years 1920 and following?

Mr. Strouss: Up to 1929. I have copies of the 521's up to 1931.

Mr. Mason: Well, we will furnish those that you don't have.

Q. Will you state whether or not the exhibit is true and correct, Mr. Herbert?

A. Yes, I believe it to be.

[fol. 2446] Mr. Mason: Have you any questions, Mr. Strouss?

Mr. Strouss: No, I have no questions.

Mr. Mason: We offer the exhibit in evidence as Defendant's Exhibit No. 180.

Mr. Strouss: Objected to as irrelevant and immaterial.

The Court: The objection is overruled. It may be admitted.

(The document referred to was received in evidence and marked, "Defendant's Exhibit No. 180.")

[fol. 2447] Mr. Mason: Mr. Herbert, I notice the exhibit indicates that in 1938 and 1939 the average train speed of passenger trains on the Tucson division showed an upward tendency. Do you know of any particular factor which will account for that tendency?

A. In 1939 the Arizona overnight fast freight had some effect on the speed on the Tucson division.

Q. Between what points is that operated?

A. Between Yuma and Tucson via Phoenix.

Q. Is that operated at passenger train speed or approximately that speed?

A. Yes, it is.

Q. Is it classed as a freight train?

A. Yes.

Q. And appears in these statistics as such?
A. It is carried in the 521 as a freight train.

The Court: You mean that train is one train carrying perishables?

A. No, it carries L. C. L., less than carload freight; it is an overnight merchandise train from the west coast, Los Angeles, Yuma, Phoenix, and Tucson.

Q. Does it stop here?

A. This is the end of its run, it goes back from here. [fol. 2448] It runs on passenger train schedule.

Q. When you speak of it running on passenger train schedule, previous witnesses have testified I believe that the maximum speed obtained by a freight train was 40 miles per hour. That has no application to this train that you refer to?

A. No, this has a passenger locomotive and uses special cars which are equipped for higher speed.

Mr. Mason: Are those special cars assigned to this particular service?

A. They are assigned to this service.

Q. Used in no other service?

A. No other service.

The Court: Is that train still in operation?

A. Oh, yes.

Mr. Mason: You have been in the courtroom when Mr. Strouss has sometimes used the expression "hot-shot"?

A. Yes.

Q. Is this one of those trains?

A. Very much so.

Q. What is the particular service that the Arizona overnight undertakes, is it in connection with truck delivery?

A. Yes, it is less than carload lot merchandise service, store to door pickup in the various cities in Arizona, espe- [fol. 2449] cially put on for this state.

The Court: Is that train operated directly from here to Yuma or does it go through Phoenix?

A. It goes through Phoenix on account of the large amount of business in Phoenix.

Mr. Mason:

Q. Do you know and if so will you state what is the consist in cars of the Arizona overnight?

A. I couldn't say exactly, but I know it is very light compared with a freight train. It is more like a passenger train consist, seven or eight or ten cars; I believe. However, I am not certain as to that, it is all according to the business available.

Q. What actual speeds does the Arizona overnight make in the state of Arizona?

A. I believe it makes a maximum passenger train speed of sixty-five miles an hour.

Q. Does it operate in regular and daily service, Sundays perhaps excepted?

A. I believe Sundays are excepted.

Q. Is there any showing on exhibit No. 81[illegible] which would indicate whether the operation of longer trains or trains of increased lengths has any substantial effect upon average speed of freight trains, and, if so, what that effect is? [fol. 2450] A. It has the effect of speeding up trains.

Q. Where do you find that indicated?

A. As shown on the upper graph, as the cars per train increased, particularly on the Salt Lake division where it is more pronounced, you will find a steady increase in speed over the years.

The Court: There was a general trend of increased speed on all three of these divisions?

A. Yes, that is true.

Mr. Mason: Did the increasing length of trains on the Salt Lake division according to the exhibit have any effect as preventing increasing train speed?

A. No, it would not prevent increasing the speed.

The Court: You wouldn't say that it was conducive to increased speed?

A. Yes, I believe it is. The average speed over the district would be enhanced by the long train operation.

Mr. Mason: Can you name any factors which would contribute to that result?

A. You would have fewer units on the road, fewer meets and passes, and naturally faster time between terminals, which this exhibit shows on the upper graph.

[fol. 2451] Q. When you speak of increased interference, you mean the meetings and passings of traffic traveling on the same line?

A. Yes.

Q. Does a meeting with another train involve stopping one or the other train?

A. It usually does; one train has to take the siding on a single-track line.

Q. Does the passing of a slower train by a faster train involve stopping of one train or the other?

A. It usually stops the freight train; the freight train necessarily takes the side track, causing delay and interference.

Q. Do those delays due to a train stopping for a meet or pass enter into the calculation of speed in miles per hour?

A. Yes, sir, because those stops and passes are at way stations.

The Court: Is my recollection correct that on the Salt Lake division there is very little double tracking?

A. There is some paired track there that is operated as double track.

Q. That is the track that is used jointly by the Western Pacific?

[fol. 2452] A. Yes, sir.

Q. With that exception it is single track in the main?

A. By the main, yes. There are other stretches of double track, however, as shown on the map, exhibit No. 1.

Q. It would go without saying where you had a double track and didn't have to by-pass this oncoming traffic that you would be able to average more miles per hour speed of the train?

A. That would be true as to meets more or less but not passes. A passenger train would necessarily have to pass a slower freight train and the more units you have on the road there the more passes you will have.

Q. But it would eliminate the oncoming traffic?

A. Yes, it would.

Mr. Mason: I notice particularly in 1931 and following there is a considerable sag in the lines representing car miles per mile of road over a period of several years between 1930 and 1936. What is the explanation of that feature?

A. That is due to fewer cars on the road, principally due to the depression years.

Q. Does that apply alike to all three?

A. That applies alike to all three, the Tucson division, [fol. 2453] Salt Lake division, and Pacific lines.

The Court: In other words, that means less business during that period?

A. That is right.

Mr. Mason: Does the average train length have any effect upon the density of traffic as expressed in car-miles per mile of road and where do you find anything to show that on exhibit No. 180?

A. It is freight car-miles divided by the miles of road.

Q. Does that tend to vary, depending upon the average train length?

A. Yes, it would put the cars over the road faster.

The Court: To arrive at what is designated "car-miles" you divide the freight car-miles by the miles of road?

A. Freight car-miles divided by the miles of road.

Mr. Mason: Have you any questions on exhibit No. 180, Mr. Strouss, before we pass to the next exhibit?

Mr. Strouss: No.

Mr. Mason: Have you before you, Mr. Herbert, an exhibit in one sheet entitled, "Comparison between Short Train Operation on Tucson Division and Long Train Op- [fol. 2454] eration on Salt Lake Division, Showing Excess Train Miles Caused on Tucson Division by Short Train Operation, Main Line"?

A. Yes, I have.

Mr. Mason: May we have this exhibit marked No. 181 for identification?

The Court: It may be marked.

The Clerk: Defendant's exhibit No. 181 for identification.

Mr. Mason:

Q. Did you prepare exhibit No. 181 for identification?

A. Yes, I did.

Q. From what sources?

A. This is also from the form 521, "Operating Statistics," on the Tucson and Salt Lake divisions.

Q. Is form 522 used for this exhibit at all?

A. Yes, the form 522 is here used prior to 1928.

Q. Referring to line 1, the figure in column C, from where is that taken?

A. Taken from the 522.

Q. For the Tucson division.

A. For the Tucson division.

Q. Is the figure in column D for the Tucson division taken from the same source?

A. It is.

[fol. 2455] Q. These are for main line operations only?

A. Main line only.

Q. The figure in column E is the quotient of column C by column D, is it?

A. Yes, it is.

Q. Where do you get the figures in column F?

A. The figures in column F, as shown on the heading, "Salt Lake Division, Cars per Train," are obtained from the form 521, 522, and 521 for the Salt Lake division.

The Court: Those same figures are shown on these other exhibits to which you have been testifying?

A. Those that show main line only, that last exhibit would have them on it, exhibit No. 180.

Mr. Mason: Where do you get the figures in column G?

A. The figures in column G are computed by dividing column C by column F.

Q. What does the figure in column G represent?

A. It represents the train-miles on the Tucson division had we been able to obtain the same cars per train on the average that we had obtained on the Salt Lake division.

Q. For the year 1925?

A. For the year 1925, or the same applies to each of [fol. 2456] the other years.

Q. Does it represent the number of train-miles which would have been produced on the Tucson division if the cars had been distributed into average trains the same as on the Salt Lake division?

A. That is right.

Q. How do you obtain the figure in column H?

A. Column H is column D, which is the actual train-miles on the Tucson division, minus column G in computed train-miles.

Q. What does column H represent?

A. It represents the excess train-miles obtaining on the Tucson division due to short train operation from the years 1925 to 1939, inclusive. At the foot of the column is the summation of all the figures shown above.

Q. You also show a total for columns D and G; are they summations?

A. They, they are also summations.

Q. As indicated by the footnote, column H is what? The total in column H in line 16 is what year? How do you obtain it? Does it represent the difference between columns G and D?

A. Yes, column D minus column G.

Q. Has the exhibit to the extent that it reproduces the original sources mentioned been compared with those [fol. 2457] sources?

A. Yes, it has.

Q. Have the computations been checked?

A. Yes.

Q. Will you say whether or not in your opinion the exhibit is true and correct?

A. Yes.

Mr. Mason: Have you any questions, Mr. Strouss?

Mr. Strouss: No questions.

Mr. Mason: I take if that the purpose of the exhibit is as indicated by the title and by the title of column H particularly?

A. Yes.

Mr. Mason: Your Honor, we offer the exhibit in evidence as defendant's exhibit No. 181.

Mr. Strouss: I object to it as irrelevant and immaterial.

The Court: Objection overruled, it may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 181.")

Mr. Mason: I don't know that it is quite clear in the record yet, Mr. Herbert, what is the primary basis of your exhibit No. 181?

A. Form 521 and its predecessor form, 522.

[fol. 2458] Q. Perhaps I should not have expressed myself that way. What is the primary theory upon which the exhibit is constructed?

A. It is based on the theory that the Tucson division, if it had not been for the restriction in train lengths, could at least obtain the same length of trains as obtaining on the Salt Lake division.

Q. You mean for main line operations?

A. For main line operation.

The Court: After all, though, it is merely a theoretical computation, is it not?

A. Yes, it is.

Mr. Mason: Of course, your Honor, we expect to develop later by other witnesses that it is feasible actually to operate as long trains on the Tucson division main line approximately as on the Salt Lake division, the law to the contrary notwithstanding. Do you wish to cross-examine now, Mr. Strouss? This is all we have at the moment for Mr. Herbert?

Mr. Strouss: No, I want to take the form 522 before I cross-examine Mr. Herbert.

Mr. Mason: You would like to have the witness withdrawn and recalled later for that purpose?

Mr. Strouss: Yes.

[fol. 2459] The Court: We will take our afternoon recess at this time.

(Thereupon a short recess was taken, after which proceedings were resumed as follows:)

B. S. Sixes was recalled as a witness in behalf of the defendant and having been previously sworn testified further as follows:

Direct examination (Continued):

Mr. Mason: Mr. Sines, you have previously been sworn and testified in the present case?

A. Yes, sir.

Q. Have you before you an exhibit in one sheet entitled "Yuma, Arizona, to Lordsburg, New Mexico, Length of Freight and Passenger Trains Operated during the Six Month Period, January to June, 1942"?

A. I have.

Mr. Mason: May we have the statement just referred to marked for identification as defendant's exhibit No. 182?

The Court: It may be marked.

The Clerk: Defendant's exhibit No. 182 for identification.

[fol. 2460] Mr. Mason: Did you prepare this exhibit or cause it to be prepared?

A. I caused it to be prepared and it was prepared under my direction and supervision.

Q. From what sources?

A. From the Tucson division train sheets for the six months, January to June, 1912.

Q. Did you actually take those six months' train sheets into your possession and abstract the figures on this exhibit therefrom?

A. I did.

Q. Has the exhibit been checked against these train sheets to determine its correctness?

A. It has.

Q. Are there any computations which appear on the exhibit?

A. Only the computations showing the totals and percentage of totals at the foot of each of the two blocks.

Q. As to the aggregation of the number of trains in the various classes, is that done by simply adding up individual trains as they were shown on the train sheets?

A. That is right.

Q. You speak of trains by classes, for example, 41 to 50. Does that represent the average length of the trains shown [fol. 2461] in column C or the maximum cars in the trains at any one time between terminals?

A. That represents the maximum number of cars in the train at any one time between terminals.

Q. Then a train, for example, in column C may have left the terminal with ten cars and picked up forty cars, hauled them for a few miles, and then dropped them and proceeded with ten cars and it would still be shown in this group, would it?

A. That is right.

Q. This one appearing under the description of passenger trains, 14 cars and over, was that taken directly from the train sheets?

A. That comes from the same train sheets, yes.

Q. Each of these trains is designated or titled similar to what is shown here?

A. That is right.

Q. Is the exhibit true and correct?

A. It is.

Mr. Mason: Have you any questions on the exhibit, Mr. Strouss?

Mr. Strouss: No, I have no questions.

Mr. Mason: What is the purpose of the exhibit, Mr. Sines?

A. The purpose of the exhibit is to show the small num-
[fol. 2462] ber and small percentage of trains that were operated in the six-month period, January to June, 1912, which exceeded 70 cars in length if they were freight trains and which exceeded 14 cars in length if they were passenger trains.

Mr. Mason: We offer the exhibit in evidence as exhibit No. 182.

Mr. Strouss: No objection.

The Court: It may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 182.")

Mr. Mason: I would like to have you refer back, if you will, Mr. Sines, to Mr. Masson's exhibit No. 149 already in evidence and I call your attention to the year 1912.

A. I have it.

[fol. 2463] Q. I call your attention to the fact that this exhibit shows the average number of cars per train in Arizona for 1912 to be 48.39?

A. That is right.

Q. How does your exhibit contrast with that exhibit?

A. My exhibit indicates that the highest percentages of trains in the blocks which I have chosen, that is, in the ten-car blocks, falls in the two blocks 41 to 50, column C, and in the other block, 51 to 60, column D. The percentage of trains falling within the block 41 to 50 is 33.59, and in the block 41 to 60 is 31.48. There is therefore indicated a check between Mr. Masson's exhibit 149 and my exhibit 182.

Q. Your exhibit, as you said, is based upon the maximum number at any one time?

A. Yes.

Q. Would your exhibit necessarily show the average length except by approximation?

A. That is right, just by approximation.

Q. Was the 75-car train the longest train that you could find on any of the train sheets?

A. It was.

Q. And only one of those?

A. Only one between Tucson and Gila operated in a west-
[fol. 2464] erly direction. It is indicated in column Q.

Q. Do you recall from the train sheet what its consist was?

A. No, I do not.

Q. Now, you show on the sheet also the number of trains classed as passenger trains exceeding fourteen cars in length. What is the total number, what is the total percentage of trains exceeding fourteen cars in length of all those classed as passenger trains?

A. There were fourteen trains exceeding fourteen cars in length, and the percentage of those fourteen trains to the total percentage of 3,118 is .44 of one per cent.

The Court: You said fourteen trains. Don't you mean sixteen?

A. Well, you will notice that the block at the foot of the page is entitled "Fourteen Cars and Over," whereas, Mr. Mason's question was as to those trains exceeding fourteen cars. To determine the figure that I used in my answer, you should go to the total commencing with column O and the line entitled "Grand Total" and adding the following figures——

The Court: I follow you now.

[fol. 2465] The Witness: (Continuing) My percentage of .44 of one per cent was determined in a similar manner.

Mr. Mason: You can add the percentage of excess, I take it, in columns O, P, Q, R and S, and get the .44 of one per cent?

A. Yes, sir.

Q. That figure of .44 per cent relates to what figure in the block relating to freight trains?

A. .38 of one per cent found in column F.

Q. What is the total percentage of trains of 61 cars or more operated in relation to the total freight trains?

A. 15.78, that figure being the total of the sum of 15.40 and .38.

Q. Now, Mr. Sines, I notice that of the trains classed as passenger trains of 15 cars or more, fourteen cars or more, of which sixteen are shown, there were eight bearing the designation "pay-trains." What were pay-trains?

A. Pay-trains were operated by the Southern Pacific Company in 1912 twice a month to pay the roadside em-

ployees outside of larger terminals. Pay-trains contained a pay-car. Along with that pay-car were a number of other official cars belonging to the officers of the division and [fol. 2466] sometimes store department cars, ordinary freight cars, and boxcars with company material in them which would be distributed along the railroad. These pay-trains were listed on the 1912 train sheets in the spaces ordinarily assigned to passenger trains. After making this exhibit, my attention was called to the fact that these pay-trains probably resembed work trains that are operated nowadays, and I shouldn't have counted them, but the exhibit as it is set up here, shows all of the trains that were operated for this six-month period.

The Court: In those days, did the company pay its employees by currency rather than by check?

A. I understand that it was currency and hard money.

Mr. Mason: Primarily in gold and silver rather than in currency, wasn't it?

A. Yes.

Q: Were these pay-trains operated in revenue service, carrying passengers?

A. No, there would be no revenue passengers on these pay-trains.

Mr. Mason: Have you any questions on the exhibit, Mr. Strouss?

[fol. 2467] Mr. Strouss: No, no questions.

The Witness: I would like to point out that, as indicated by the lower block of the exhibit, there were no regular passenger trains which exceeded fourteen cars in length. There was a special reason for the operation of every one of those extra-length passenger trains.

Mr. Mason: Will you refer now, Mr. Sines, to an exhibit entitled "Tucson Division, Yuma, Arizona, to El Paso, Texas, Locomotives in Service, January to June, 1912?"

A. Yes.

Mr. Mason: May we have this statement marked Exhibit 183 for identification?

The Court: It may be marked.

The Clerk: Defendant's Exhibit No. 183 for identification.

Mr. Mason: Did you prepare this exhibit or cause it to be prepared?

A. I assisted in its preparation and caused it to be prepared.

Q. From what sources was it prepared?

A. From the same 1912 train sheets of the Tucson division referred to in connection with the previous exhibit, No. 182.

Q. Are the train sheets to which you have referred [fol. 2468] available for the use of opposing counsel?

A. Yes, sir, they are in my possession here in Tucson.

Q. And they can be made available if counsel desires?

A. That is right.

Mr. Mason: If you will indicate, Mr. Strouss, whether you want them or not, we will bring them if you so ask.

Mr. Strouss: I don't know that I do now. I will see what other evidence goes in.

Mr. Mason: Does the exhibit or, rather, does the underlying source, the train sheets, indicate the use, whether regular or occasional, of the various types of locomotives indicated?

A. Yes, that is one of the essential items that is recorded on the train sheets at the beginning of each train's operations. The train dispatcher working the district covered by the train sheets heads up the trains with the conductor and engineer's name, the number of the train and the number of the locomotive. That practice has been invariable for at least the 28 years that I have had occasion to examine Southern Pacific Company train sheets.

[fol. 2469] Q. Can you determine from the locomotive numbers what types they are or were?

A. Yes, those numbers have been carried right down to the present day on the same locomotives; the numbers haven't changed on individual locomotives.

The Court: You don't mean to say that there were locomotives that were in use in 1912 that are still in use?

A. Oh, yes.

Mr. Mason: They are not in the same use, I take it.

A. No, not many of these locomotives see main line service nowadays, but that is not unknown either.

Q. Now, you show—first, I will ask you, has exhibit 183 been compared and checked to determine its correctness?

A. It has.

Q. You show in column D numbers. Do those numbers actually appear as the destination of these locomotives on the train sheet for the periods studied?

A. They do.

Mr. Mason: Have you any questions, Mr. Strouss?

Mr. Strouss: What do the figures indicate in Column F [fol. 2470] under head "passenger"?

A. They indicate the number of units that were operated, or that I found were operated during that six months' period.

The Court: And column E.

Mr. Mason: The Court asked as to column E. Does that indicate the same thing?

A. The same thing.

Q. You say here "occasional"; what does that mean as applied to the first line?

A. There were two units of Mogul 4's operated. They usually appeared in passenger service, but we found them occasionally hauling freight trains, from which I concluded that the regular assignment was passenger service, but as occasion arose, they could be used in freight service. The same practice prevails today.

Q. Does that same explanation apply to the word "occasional" in columns E and F otherwise?

A. That is right.

The Court: Well, Mr. Sines, coming to your total column down there though, do I understand that during the period January to June of 1912 there were 125 freight and passenger trains that operated over these lines shown here on the exhibit?

A. No, that is not right. During that time there were, [fol. 2471] referring to exhibit No. 182, there were 4,187 freight trains, and 3,118 passenger trains, but these trains were hauled with 125 locomotives, which are indicated on Exhibit 183.

The Court: Oh, I see.

Mr. Mason: As a matter of fact, Mr. Sines, do these locomotives generally receive repeated daily use?

A. That is right.

Q. Subject, of course, to such roundhousing or shop work as may be necessary from time to time?

A. Yes.

The Court: In other words, what this exhibit really shows, take line 8 there, for instance, in which you have 40 freight locomotives of the consolidation 9 type, wheel arrangement 2-8-0?

A. That is right.

Mr. Mason: Now, I will ask you to refer—Well, I will introduce the exhibit first. We offer the exhibit in evidence as Defendant's Exhibit No. 183.

Mr. Stgouss: I have no objection.

The Court: It may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 183 in evi-[fol. 2472] dence.")

Mr. Mason: I will ask now to refer to Exhibit No. 5.

A. All right.

Q. Do you find some or all of the types indicated on exhibit 183 shown on exhibit 5 and in that connection, will you also please refer to exhibit 6, which shows the passenger types?

A. On the two exhibits, 5 and 6, we find the Mogul locomotive, the Consolidation; on exhibit 6 we find the ten-wheel; on exhibit 5 we find Consolidation locomotives. We don't have the 12-wheel locomotives on exhibits 5 and 6.

The Court: In other words, what is designated on exhibit 6 as the Pacific passenger locomotive and on exhibit 5 as the Mikado freight locomotives were not then in use?

A. Yes, they were in use at that time elsewhere on the Southern Pacific, but not here in Arizona on the Tucson division. We don't find the Atlantic type on the exhibit No. 6, which is devoted principally to passenger locomotives, whereas, when I examined the 1912 train sheets I found that the Atlantic type was the principal passenger locomotive in use on the Tucson division. I therefore put the note at the foot of the exhibit to the effect that the [fol. 2473] Atlantic type 3 had and has—we still have a couple of them in service—a tractive effort of 24,680 pounds.

Mr. Matson: Where do you obtain that information of the tractive effort of the A-3 type?

A. That is from the Southern Pacific record of locomotives.

Q. Is that a small black book regularly kept?

A. Yes, it is.

Q. And circulated for the use and information of officers?

A. That is right.

Q. Have you a copy of it available here?

A. I don't have one in the court room, but we have several in the office.

Mr. Mason: (Addressing Mr. Strouss) Would you like to see it?

Mr. Strouss: No.

The Witness: I wanted to continue with the observation that the 24,680 pounds noted for the Atlantic type indicates that that engine is somewhat smaller that the ten-wheel locomotive shown on exhibit No. 6, whose tractive effort is shown as 25,260 pounds.

Mr. Mason: I will ask you now, Mr. Sines, to refer to an [fol. 2474] exhibit in one sheet entitled, "Full Crew Laws, States of Nevada and Arizona."

A. Yes.

Q. Have you that exhibit before you?

A. I have.

Q. Did your prepare this exhibit, or cause it to be prepared?

A. I did.

Mr. Mason. May this be marked No. 184, for identification?

The Court: It may be marked.

The Clerk: Defendant's Exhibit No. 184 for identification.

Mr. Mason: From what source did you take the information shown hereon?

A. From the revised codes of the two states, Nevada and Arizona, in the possession of the Southern Pacific Law Department.

Q. Have the texts of the statutes which purport to be shown here been checked against the original published volumes?

A. They have.

Q. Will you state whether or not the exhibit is true and correct?

A. It is.

Mr. Mason: Your Honor, I will state that the purpose of the exhibit, of course, is to show that the requirements [fol. 2475] of the states, of the two states as to the crews of freight trains are substantially the same, and thus to indicate to that extent a similarity between the two states, and to lay a further foundation for comparisons between the two states heretofore made and hereafter to be made. Have you any questions, Mr. Strouss?

Mr. Strouss: No.

Mr. Mason: We offer the exhibit in evidence as Defendant's Exhibit No. 184.

Mr. Strouss: No objection.

The Court: It may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 184.")

The Court: Do I understand then, Mr. Mason, from this last exhibit that at the same general election at which the train-limit law was referred to the people and passed, that the Arizona full-crew law was also approved at that same election? It would appear so from this exhibit.

Mr. Mason: It would appear so from the exhibit and, while I never had that called to my attention before, I think that is unquestionably the fact. We might look at the Revised Code.

The Court: Never mind, I will look it up.

[fol. 2476] Mr. Mason: Have you before you, Mr. Sines, a statement in one sheet bearing the title "Southern Pacific Company, Summary of Freight Train Operations of Trains of Seventy Cars and Less, and Seventy-One Cars and Over in Specific Districts," and so forth?

A. I have.

Mr. Mason: May we have this statement marked Defendant's Exhibit No. 185?

The Court: It may be marked.

The Clerk: Defendant's Exhibit No. 185 for identification.

Mr. Mason: How was this exhibit prepared, Mr. Sines?

A. This exhibit was prepared at my request and under my direction by the office of the auditor of freight service accounts.

Q. Did you supervise its preparation?

A. I did.

Q. From what underlying sources was it prepared?

A. From the conductors' wheel reports.

Q. Was it prepared directly from the wheel reports?

A. It was.

Q. Does it purport to show the cars by classes, the trains [fol. 2477] by classes, according to the maximum number of cars in the train at any one time between the points shown?

A. That is right.

Q. Where do you obtain the mileage figures in column C?

A. From the mileage records of the Company, based on engineering records, and also mileage records in the auditor of freight service accounts' office.

Q. Now, will you explain how the figures in columns D and E were actually obtained from the wheel reports?

A. By the laborious process of counting the number of cars on each conductor's wheel report to determine the highest number handled at any one time between the points indicated.

Q. Who made the selection of the points between which the trains should be studied?

A. Those freight districts are districts which the auditor of—I just noticed I have stated several times that it is the office of the freight service accounts—it is the auditor of the equipment service accounts who did this job.

Q. Do they use these same terminal points or boundary lines for various purposes in accounting?

[fol. 2478] A. They do.

Q. Do they split their accounting at state lines?

A. Yes. The railroad is divided up in these districts and they make a series of reports on car-miles, train-miles, locomotive-miles, gross ton-miles, and net ton-miles. The whole system of railroad accounts is built according to the districts indicated on this exhibit.

Q. Now, you show here, for example, from California-Oregon line to Klamath Falls, and then further down from Dunsmuir, California-Oregon line (Cascade); are those two separate parts of a continuous district between Dunsmuir and Klamath Falls?

A. Yes, they are.

Q. And some of the trains between Dunsmuir and the California-Orgeon line continue on into Klamath Falls, or vice versa?

A. That is right.

The Court: But there is no duplication?

A. There is duplication, yes.

Mr. Mason: Where is that duplication?

A. Because these trains run very often in more than one district, but the accounting has to be performed in these [fol. 2479] districts in order that no trains will be missed.

The Court: In other words, the same train may be counted through each division through which it passes?

A. Yes, sir.

[fol. 2480] Q. Then where a state line cuts across a freight train district the same train may appear on one side of the state line and on the other side of the state line?

A. Yes, sir, the reason for our counting in that manner is to enable us to prepare each state's statistics, and carrying it to the ultimate conclusion we pay certain taxes based on operations on each side of the state line, taxes on the same freight train.

Q. Looking at lines 27 and 28, you show San Francisco to Watsonville Junction, line 28, San Francisco to Redwood. Would the trains which run from San Francisco to Redwood be included within the trains running from San Francisco to Watsonville Junction?

A. No, they would not. The San Francisco-Redwood territory, while it follows the same route is a separate series of trains which run up and down the Peninsula in local service, some of them crossing the San Francisco Bay on the Dumbarton Bridge and then coming around to Oakland. From San Francisco to Watsonville Junction, the through trains operate through San Jose. Note the next district, Watsonville Junction to San Luis Obispo.

Q. Is that a continuation of the San Francisco-Wat-[fol. 2481] sonville Junction district?

A. Yes, a slightly larger number of trains indicating generally that those trains are operating through from San Francisco to points south of Watsonville Junction.

Q. Your showing, I notice, relates to four months of the year 1939. Will you say why only four months are shown instead of the entire year?

A. I thought that the four months represented a typical cross-section of the year's operation, and it is customary to select these particular four months to make showings of this kind and relieve ourselves of the burden of performing a lot of unnecessary work.

Q. Is the work of checking the wheel reports for the purpose of this showing a considerable job?

A. Yes, the magnitude of the task of preparing this exhibit can be appreciated by adding the two figures together at the bottom of the sheet, 45,000+ and 16,000, indicating there were over 61,000 conductors' wheel reports examined and the cars were individually counted on those wheel reports. Many of the wheel reports consist of four, five, and six sheets each.

Q. This was only for four months?

A. That is right.

[fol. 2482] Q. The job for a year would have been how much larger?

A. Three times larger.

Q. Who made the computations in column F and how are they made?

A. They were made by people under my supervision and were made by totaling the figures in columns D and E and dividing the figure in column E by the sum.

Q. So that column F represents the proportion of long trains, using that term to indicate trains of more than 70 cars?

A. Yes.

Q. Are these trains exclusive of caboose or inclusive of caboose?

A. These trains are exclusive of caboose, corresponding to the language of the Arizona law, which says "70 cars exclusive of caboose."

Q. You show here under item 37, Indio to California-Arizona line. Is that the operation between Indio and the bridge or does that include whatever mileage these trains may have operated after crossing the bridge and within the limits of Yuma?

A. It does; a part of that 122 miles is in the state of Arizona.

[fol. 2483] Q. And except for that and the showing in line 39 is the state of Arizona represented on this exhibit at all?

A. That is the only representation that Arizona has on this exhibit.

Mr. Mason: Have you any questions on the exhibit, Mr. Strouss?

Mr. Strouss: No questions.

Mr. Mason: We offer the exhibit as defendant's exhibit No. 185.

Mr. Strouss: I object to it as irrelevant and immaterial.

The Court: Objection overruled, it may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 185.")

Mr. Mason: Mr. Sines, I call your attention to the fact that in Oregon the percentage of trains of 70 cars and less in some of the districts particularly between Eugene and Brooklyn and between Klamath Falls and California Oregon line and between Ashland and Eugene is somewhat greater than of the trains of 71 cars and over. Is there a local or gathering service in those territories?

A. That is right. In 1939 and for some years prior to 1939 we have not operated any through service over our [fol. 2484] Oregon line going through Ashland. The trains represented in the districts you have indicated are local trains wholly.

Q. Is that true between Eugene and Brooklyn?

A. No, that is not true between Eugene and Brooklyn. Our through service between California, Eugene and Portland, is over the Cascade line through Klamath Falls and Chemult.

Q. Does that through service also pass through Eugene and thence to Brooklyn?

A. Yes.

Q. What other service is rendered in the territory between Eugene and Brooklyn besides this through California-Oregon service.

A. We run a very extensive local service in that part of Oregon, particularly in the lumber and logging business. Many of the trains indicated on this exhibit are made up almost entirely of logging cars.

Q. Are those predominantly long trains or predominantly short trains?

A. Those trains will very seldom approach 70 cars so they are predominantly short trains.

Q. You show in California in many districts a predominance of trains of 70 cars and less. Will you explain how that comes about?

[fol. 2485] A. There again the short trains that were run in California are more apt to be local hauler and gathering trains than through trains. We endeavor whenever possible on all of our main line operations in California to build the trains up to the full capability of the engines and this means in most instances that the trains will exceed 70 cars in length.

Mr. Mason: Have you any question before we leave the exhibit, Mr. Strouss?

Mr. Strouss: No questions.

Mr. Mason: Will you [illegible] Mr. Sines, please, to a statement in one sheet entitled "Summary of Freight Train Operations by Various Lengths between Sparks, Nevada, and Ogden, Utah"?

A. Yes.

Mr. Mason: May we have the statement marked "Defendant's Exhibit No. 186"?

The Court: It may be marked.

The Clerk: Defendant's exhibit No. 186 for identification.

Mr. Mason: Did you prepare defendant's exhibit No. 186 for identification or cause it to be prepared?

A. I did.

Q. From what sources?

[fol. 2486] A. From the conductors' wheel reports in the territories indicated.

Q. Does this cover main line territory entirely?

A. It does.

Q. Between Sparks and Ogden?

A. Right.

Q. Will you say whether or not the method of the preparation of the exhibit was substantially the same as exhibit No. 185?

A. Exactly the same.

Q. How was the segregation into groups as shown by columns A to I, inclusive, made?

A. By determining the highest number of cars handled at any one time by our trains and tallying the trains according to the number of cars indicated in those groups.

Q. Did you supervise the preparation of the exhibit?

A. I did.

Q. Have you checked it?

A. Yes.

Q. Will you say whether or not it is true and correct?

A. It is.

Q. I notice in column 1 you show a classification, 121 to 130?

[fol. 2487] A. Yes.

Q. Were there no trains in excess of 130 cars operated?

A. No, there were none in the four months that we have tabulated. The reason I answer that way is that trains of over 130 cars are not unknown in Nevada or in the territory covered by this exhibit.

Q. You have shown on the exhibit the four months, January, April, July, and October. Did you select those particular months?

A. Yes.

Q. For what reason?

A. Because it gives a typical cross-section of the year's operations. I might point out also that those four months embrace a winter month, a spring month, a summer month, and a fall month, and I have also assisted in making compilations and summaries for those particular four months in reports to the Interstate Commerce Commission. The JA-JO months, as we call them, are the months commonly used in making exhibits of this character.

The Court: Mr. Sines, the territory covered by this exhibit No. 186 is in what is known as the Salt Lake Division?

A. Yes, sir.

[fol. 2488] Q. But these subdivisions you have made into those three different units, are those freight divisions or why did you cut it up into these three subdivisions shown here?

A. The territories chosen on exhibit No. 186 are the same as the territories shown on exhibit No. 185. I refer you to line 42 of exhibit No. 185 where you will find a total number of trains operated by adding 467 and 1,225, or 1,692 trains. That is the total shown in the Sparks, Nevada-Carlin,

Nevada, district on exhibit No. 186. Similarly, the trains between Carlin and the Nevada-Utah line total 1,268 on both exhibits.

Q. Are those freight divisions?

A. No, they are not. Sparks, Nevada, and Carlin, Nevada, embrace two freight train districts but as I explained in connection with exhibit No. 185 Sparks-Carlin district is a district which our auditor of equipment service accounts uses in compiling his statistics. I didn't necessarily have to follow that system of districts, but it was convenient to do so. Sparks-Carlin freight district was originally established by the auditor of equipment service accounts because it embraced those two freight districts and was a territory which they simply found convenient to set up.

[fol. 2489] Q. Then the real answer to the Court's question is that it is set up in this manner because that is the manner in which the company keeps the records.

A. Yes, sir.

Mr. Mason: You show Carlin to the Nevada-Utah line, the split at the state line is for accounting purposes as between the two states?

A. That is right.

Q. And for the purpose of rendering reports to the two states?

A. That is right.

Q. Carlin to the Nevada-Utah line embraces what freight train district?

A. The freight train district from Carlin to Montello embraces the district Carlin to Nevada-Utah line.

Q. Carlin to Nevada line includes other mileage besides the Carlin-Montello district?

A. Isn't my recollection correct that the state line is west of Montello?

Q. Your recollection is wrong, the state line is east of Montello as I think Exhibit No. 1 shows.

A. That is right, I have confused Lucin with Montello. The Carlin to Nevada-Utah line does embrace the Carlin-Montello freight district.

[fol. 2490] Q. And some mileage between Montello and the Nevada-Utah line?

A. Yes, sir.

Q. And the balance of the mileage in the Montello-Ogden district is between the Nevada-Utah line and Ogden?

A. Yes.

Q. Does this include all of the main line mileage between Sparks on the west and Ogden on the east, all of the principal main line of the Salt Lake division?

A. Yes.

Q. Have those computations been checked to determine their correctness?

A. They have.

Q. Will you say whether or not that exhibit is true and correct?

A. It is.

Mr. Mason: We offer the exhibit subject to questions by opposing counsel as defendant's exhibit No. 186.

Mr. Strouss: I object to it as irrelevant and immaterial.

The Court: Objection overruled, it may be admitted.

(The document referred to was received in evidence and [fol. 2491] marked "Defendant's Exhibit No. 186.")

Mr. Mason: Does your exhibit show in any one calculation the total number of trains of 71 cars or more and the total number of trains of 70 cars and less operated in the territory covered and during the months referred to?

A. No, it does not. It is necessary to add up three figures shown in the recapitulation to answer your question.

Q. You would have to add up the total trains of each class?

A. Yes.

Q. And the total trains and then make the calculation?

A. That is right.

Q. Could it be done from the face of the exhibit without difficulty?

A. Yes.

Q. Have you a statement in one sheet entitled, "Maximum Number of Cars Handled in Various Main Line Passenger Trains, January, April, July, and October, 1939"?

A. Yes.

Mr. Mason: May we have this statement marked as "Defendant't Exhibit No. 187" for identification?

[fol. 2492] The Court: It may be marked.

The Clerk: Defendant's exhibit No. 187 for identification.

Mr. Mason:

Q. Was this exhibit prepared under your supervision?

A. It was.

Q. In what manner?

A. By examination of the passenger conductors' wheel reports and tabulating the maximum number of cars handled at any one time in the blocks indicated.

Q. Are the passenger conductors' wheel reports the source of the information shown?

A. They are.

Q. Who made the selection of the period studied?

A. I did.

Q. For what reasons?

A. For the same reasons previously indicated in connection with the prior exhibits.

Q. What is the basis of the car count or classification of the lengths of trains? Does this indicate the average length or maximum length at any one time?

A. Maximum length at any one time. I may say with respect to our main line through passenger trains that in [fol. 2493] many cases the maximum number is also the number for the entire trip of the train. Some trains don't make any set-outs or pick-ups enroute.

Q. You mean at points on our line?

A. Yes.

Q. Are some of these trains operated through in connection with other railroads?

A. Yes.

Q. Which ones particularly of those shown on this exhibit?

A. Trains on the Ogden route; the Ogden route is the only east and west route on this exhibit.

Q. You do not show here the operation over the route from Los Angeles east. Is that to be shown elsewhere?

A. That is handled on the next exhibit.

Q. Has the exhibit been checked against the underlying sources?

A. It has.

Q. Will you say whether or not it is true and correct as reflecting those sources?

A. It is.

Q. There are certain computations, percentages, shown here. Did you make those computations or cause them to be made under your supervision?

[fol. 2494] A. They were made under my supervision.

Q. How were they made? What figures were used in making them?

A. The figures in each of the columns were added to give totals. The totals were then cross-footed with the totals in column Q and percentages were figured, using the total in column Q as one hundred per cent. The percentages indicated in the middle of the sheet and between the blocks are arrived at by adding the number of trains in the percentages over 14 and under 15.

Q. You show between columns M and N a somewhat heavier line. Is that of any particular significance?

A. Merely to call attention to the fact that that is where the Arizona Train Limit Law applies.

Q. That marks the boundary line between 14 and 15 cars, does it?

A. That is all.

Mr. Mason: Have you any questions, Mr. Strouss?

Mr. Strouss: No questions.

Mr. Mason: We offer the exhibit in evidence as defendant's exhibit No. 187.

Mr. Strouss: I object to it as irrelevant and immaterial.

[fol. 2495] The Court: Objection overruled, it may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 187.")

Mr. Mason: Will you refer, please, to an exhibit in one sheet entitled, "Number of Passenger Trains of Different Lengths between Los Angeles, California, and El Paso, Texas, Year 1939"?

A. Yes.

Mr. Mason: May we have this statement marked as "Defendant's Exhibit No. 188" for identification?

The Court: It may be marked.

The Clerk: Defendant's exhibit No. 188 for identification.

Mr. Mason:

Q. Did you cause this exhibit to be prepared, Mr. Sines?

A. I did.

Q. From what sources?

A. From the passenger conductors' wheel reports for the trains indicated.

Q. Was the exhibit prepared under your supervision?

A. It was.

Q. I note that you show an entire year here, why is that? [fol. 2496] A. This covers the southern route which embraces Arizona and we made the showing complete for one year.

Q. Will you say whether or not this exhibit was prepared in similar fashion to exhibit No. 187?

A. Exactly the same.

Q. And is the showing a maximum number of cars at any one time between the points referred to?

A. That is right.

Q. Does this include special trains or extra sections of regular trains or only regular trains themselves?

A. Only the regular trains; that same observation applies to exhibit No. 187.

Q. There are no special trains shown there?

A. No.

Q. Although such special trains may have been operated as extra sections of regular trains?

A. And undoubtedly were in many instances.

[fol. 2497] Q. If a train, for example, of the character referred to by Mr. Baker, operated especially for the transportation of government troops had moved during the year 1930, would such a train have been shown on this exhibit?

A. No.

Q. Did you make, or check the computations which appear in the total and percentage columns in the recapitulations?

A. I had them made and checked them.

Q. Will you say whether the exhibit is true and correct?

A. It is.

Q. I notice that some of the eastward trains, all of the eastward trains: 2, 4, 6 and 44, between Yuma and El Paso, are shown as operating 364 rather than 365 times during the year. What is the explanation of that?

A. We had some washouts on the Southern route that caused us to suspend operations. For one day trains were annulled, and we didn't run any passenger trains. Apparently the westbound trains managed to get through, may be they got through before the railroad was washed out.

Q. At any rate they were not annulled?

A. Not the westbound.

[fol. 2498] Mr. Mason: Have you any questions, Mr. Strauss?

Mr. Strouss: No.

Mr. Mason: We offer the exhibit as Exhibit 188.

Mr. Strouss: No objections.

The Court: It may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit 188.")

Mr. Mason: Have you——

The Court: Pardon me a minute. Mr. Sines, the pleadings indicate, at least, that it is the contention of the defendant that the Arizona law has an extra-territorial effect. Does this exhibit 188 reflect that condition in any way?

A. Only by inference and in this manner: Train 2, the Sunset Limited eastbound, operated 29 times with consists of over 14 cars between Los Angeles and Yuma. It operated no times between Yuma and Lordsburg with consists of over fourteen cars, and it then operated three times between Lordsburg and El Paso with consists of over fourteen cars. Something happened to that train to make it run with fourteen cars and less in Arizona, and with over fourteen cars immediately outside the state.

Mr. Mason: Now, I think his Honor's question was asked [fol. 2499] as to extra-territorial effect.

A. As to conditions between State Line and Lordsburg, at least, there is an extra-territorial effect where that train didn't exceed fourteen cars.

Q. Is there any way that No. 2 running between Yuma and Lordsburg could have been built up to more than fourteen cars at the Arizona-New Mexico boundary?

A. Not conveniently.

Q. Is there any terminal at the Arizona-New Mexico boundary which is passed by No. 2 on its eastward course?

A. No.

Q. Carrying out the possibilities of extra-territorial effect, Mr. Sines, how many times out of a total of 365, was No. 1, the Sunset Limited, operated from El Paso to Lordsburg with an excess of fourteen cars?

A. Six times.

Q. Out of 365?

A. Yes.

The Court: It won't be necessary to go into all those figures. I think the exhibit speaks for itself.

Mr. Mason: Will you take up, there, the statement Mr. [fol. 2500] Sines, entitled "Cars Received and Forwarded at El Paso, Texas, Years 1930 to 1939, Inclusive, and at Ogden, Utah, Year, 1939."

A. Yes, sir.

Mr. Mason: May we have this statement marked Defendant's Exhibit No. 189 for identification?

The Court: It may be marked.

The Clerk: Defendant's No. 189 for identification.

Mr. Mason: Did you prepare this exhibit or cause it to be prepared, Mr. Sines?

A. I caused it to be prepared.

Q. From what sources?

A. The figures opposite the word "Refrigerators" are taken from the records of the Pacific Fruit Express Company, their car accountant; the other figures are taken from the Southern Pacific Company interchange records covering El Paso and Ogden.

Q. Now, those cars that are received at El Paso eastward, are those cars which have passed through the State of Arizona?

A. That is right.

Q. Do those figures represent cars which have moved into El Paso from the west over the lines which extend through Arizona and New Mexico?

[fol. 2501] A. Yes.

Q. Would that include any cars originating at Lordsburg or at Deming or at branch line points served out of Lordsburg or Deming?

A. It would.

Q. Or any cars originating at points on the south line between Rodeo and El Paso?

A. Yes, sir.

Q. Is there any substantial volume of such traffic?

A. No, that is very sparsely settled territory.

Q. Now, as to cars forwarded at El Paso westward, does that include cars moving from El Paso into or across Arizona?

A. It does.

Q. Would it also include cars destined to Deming and Lordsburg?

A. Yes.

Q. And points on the south line east of Rodeo?

A. Yes.

Q. Is there any substantial volume of that traffic?

A. No.

Q. Why do you show the cars received at Ogden and forwarded at Ogden?

A. Because that is a point comparable to the Nevada [fol. 2502] territory, that is a point which stands to the Nevada territory in the same relation as El Paso stands to the Arizona territory; it is the gateway to Nevada just as El Paso is the gateway to Arizona.

Q. So far as the Southern Pacific Company lines are concerned?

A. Yes.

Q. Why do you show the distribution here as between loads and empties, and between refrigerator cars and other cars?

A. Well, those were the principal classifications of interest in examining in making an analysis of traffic moving in any territory.

Q. What class of loading moves in the refrigerator cars in eastward movement?

A. The perishable commodities originating in California and in Arizona and moving largely in, well, if it is an eastbound load, it moves entirely in Pacific Fruit Express Company cars. If it originated on Southern Pacific lines.

The Court: Well, according to this exhibit, Mr. Sykes, your eastward movement through El Paso, you have twice as many refrigerator cars as all other types of freight cars put together?

A. That is right.

The Court: I was astounded at the number of empties [fol. 2503] going east. How do you account for that?

A. Well, I am going to answer your question indirectly, if I may. The business of these east and west transcontinental lines is largely devoted to hauling perishables eastward and manufactured products westward. Certain manufactured products—too large a proportion, we think, do not lend themselves to loading in empty refrigerator cars, so that the refrigerator cars have to return west empty. By the same token, you cannot load perishable business in the ordinary boxcar which is used to haul the

manufactured products west; therefore, we have an unbalanced movement of empty boxcars east.

The Court: You do have the right, though, under your agreements with connecting carriers, any car that might belong to any of these eastern roads that came loaded west, by the same token you could load it east if you had the cargo to put in it?

A. Not only could we but we are obligated by our agreements with the A. A. R. and with other railroads to do that very thing. This simply means that we didn't have enough dead loads, as distinguished from perishable loads, to put in those cars.

[fol. 2504] The Court: Well, you did have a huge traffic in empties both east and west?

A. Yes.

The Court: And that is, of course, non-revenue producing?

A. That is right.

Mr. Mason: Do I understand, then, Mr. Sines, that the empties east are largely boxcars made empty in western destination territories for which there is no appropriate eastbound load?

A. Yes.

Q. And the empties west are largely refrigerator cars which are required in the western origin territory and cannot be used within the time limits or because of the nature of the loading for the western movement?

A. That is right.

The Court: But do I understand that there are types of freight that you are permitted to haul westward in your refrigerator cars?

A. Yes, sir. Now, just a little bit further in that line: A large part of our business eastward which does not consist of perishable business consists of lumber loading from Oregon and Northern California. That requires a very fine type of car, a weather-tight car, and the Southern [fol. 2505] Pacific Company has to furnish those cars largely itself, because after we get those cars out here on the Coast that have handled these manufactured products westward, we cannot load lumber in them, they are not

suitable for lumber loading. That is again the reason why we find 44,076 empty cars going back east. We might put lumber in those cars if they were capable of——

Mr. Mason: 44,076, you said?

A. That is wrong; that is 28,370.

Mr. Mason: Have you any questions on the exhibit, Mr. Strouss?

Mr. Strouss: No.

Mr. Mason: I offer it in evidence as No. 189.

Mr. Strouss: I object to it as irrelevant and immaterial.

The Court: The objection is overruled. It may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 189.")

Mr. Mason: Have you a statement in one sheet entitled "Loaded and Empty P. F. E. and Other Car-Miles, States of Nevada and Arizona, Main and Branch, Freight and Mixed," Mr. Sines?

A. I have.

Mr. Mason: May we have this statement marked No. [fol. 2596] 190 for identification?

The Court: It may be marked.

The Clerk: Defendant's Exhibit No. 190 for identification.

Mr. Mason: Was this exhibit prepared by you or under your direction, Mr. Sines?

A. This was prepared under my supervision.

Q. From what source?

A. Again the records with respect to Pacific Fruit Express Company cars come from the car accountant of the Pacific Fruit Express Company, and the other figures come from our auditor of equipment service accounts' office.

Q. Are those records of accounts, which are regularly kept for taxation and reporting purposes to the state commissions of the two states?

A. They are, that is one of the purposes.

Q. Has the exhibit been checked against the original records in these accounting offices for the purpose of determining its correctness?

A. It has.

Q. I notice certain computations in column 8. Are those made from figures on the face of the exhibit?

A. They are.

Q. Will you indicate with reference to line 1929 how [fol. 2507] you obtain the figure for that year in column 8; for example, for the state of Nevada?

A. Divide the——

The Court: I don't think you need to go into that, Mr. Mason. The Court follows it. It is a mere mathematical computation.

The Witness: That is right.

Mr. Mason: It is a mere division of a certain figure in order to get the P. F. E. percentage?

A. That is right.

Q. Is the exhibit true and correct to the best of your knowledge and belief, Mr. Sines?

A. It is.

Mr. Mason: Have you any questions, Mr. Strouss?

Mr. Strouss: No questions.

Mr. Mason: We offer the exhibit in evidence as Defendant's Exhibit No. 190.

Mr. Strouss: We object to it as irrelevant and immaterial.

The Court: The objection is overruled. It may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit 190.")

Mr. Mason: Mr. Sines, I notice that Exhibit 190 indicates that the percentage of P. F. E. cars in the year 1929 [fol. 2508] was 42.7 of the total moving in Nevada, and 46.4 of the total moving in Arizona, I should say the percentage of car-miles made by P. F. E. cars as stated in these percentage columns, whereas in the year 1932 the percentage of car-miles made by P. F. E. cars was 58.0 in Nevada and 64.2 in Arizona, and there appeared to be other fluctuations up and down for various years. Can you explain those fluctuations?

A. Yes. During the depression years, the perishable business between California and Arizona and eastern territories held up better than the general average of railroad business, which resulted in a greater percentage of

P. F. E. cars and car-miles than existed prior and has existed subsequent to the severe depression years.

Q. Do the trends of the percentage of P. F. E. cars to the total cars handled as expressed in car-miles made in the two states follow along the same line in both states for the various years?

A. They are closely parallel.

Q. Have you before you, Mr. Sines, a statement in one sheet entitled "Average Number of Freight Trains Per Day Per Mile of Road for Selected Months of Years 1928 to 1939, Inclusive?"

A. I have.

Mr. Mason: May we have this statement marked Defend-
[fol. 2509] ant's Exhibit 191 for identification.

The Court: It may be marked.

The Clerk: Defendant's Exhibit 191 for identification.

Mr. Mason: Did you prepare this exhibit or cause it to be prepared?

A. I caused this exhibit to be prepared.

Q. Was it prepared under your direction?

A. It was.

Q. Will you state the source?

A. The source of these figures is the Southern Pacific forms S-1232, entitled "Efficiency of Freight Locomotive Loading."

Q. Have you the forms S-1232 for the years 1928 and following which are shown on this exhibit?

A. Yes, we have them here in Tucson, and they can be made available if desired.

Mr. Mason: Mr. Strouss, will you state whether or not we haven't furnished you with forms S-1232 for some of the years shown here?

Mr. Strouss: That is what I was going to ask. I think I have them for the last ten years.

The Witness: We gave you the annual statements for the entire railroad for the years 1930 to 1939.

Mr. Mason: But these are two months of each of these
[fol. 2510] years, are they?

A. Yes, these are monthly statistics.

Q. They would be considerably more voluminous than what you gave Mr. Strouss?

A. That is right.

Q. Again, these are by two freight districts, which as indicated here, are particular main lines of two divisions?

A. That is right.

Mr. Strouss: I have them by months too, haven't I?

A. I don't think so; you might have.

Mr. Mason: You say this is computed from these underlying sources, Mr. Sines?

A. Yes.

Q. Now, you have shown only back to the year 1929. Were prior years available?

A. No.

Q. Form S-1232 is not compiled?

A. No.

Q. Why do you show February and October for the Sparks-Ogden territory?

A. February is the month of lightest traffic, and the month of October is the month of heaviest traffic in the Sparks-Ogden territory.

Q. You show the months of August and June for the [fol. 2511] Yuma-Lordsburg district; why is that?

A. They are the similar months for the Yuma-Lordsburg territory.

Q. Which is the light, and which is the heavy month?

A. August is the light month, and June is the heavy month.

Q. Precisely what line or lines between Yuma and Lordsburg are covered by this showing?

A. The main line via Gila and Bowie.

Q. This doesn't include the alternate line via Phoenix?

A. No.

Q. Or any part of the line between Mescal and Douglas, and so on, to El Paso?

A. No.

Q. Did you make the computations for the last five years shown in the block at the foot of the exhibit?

A. I did.

Q. From the face of the exhibit itself?

A. No, that has to be made from the basic figures in order to avoid making an average of averages.

Q. Has the exhibit been checked?

A. It has.

[fol. 2512] Q. Is it true and correct?

A. It is.

Mr. Mason: Have you any questions, Mr. Strouss?

Mr. Strouss: No questions.

Mr. Mason: Mr. Sines, why did you select the Yuma-Lordsburg line, the Yuma-Gila-Bowie-Lordsburg line, as you have defined it, for the purposes of this comparison on this exhibit?

A. That is the principal freight route across Arizona.

Q. And is the Sparks-Ogden route the principal freight route across Nevada and Utah?

A. It is.

The Court: Did I understand you to say that any trains that were sent from Yuma via Phoenix would not be included in this?

A. No, they are not.

Mr. Strouss: Just one question. When you say "per mile of road," just what do you mean by that?

The Court: I want to find that out, too.

A. A mile of road is just a unit of distance on the route, and the figure indicated on this exhibit was determined by adding the total train-miles in the district, and then dividing by the distance from one terminal to the other, [fol. 2513] which gives an average figure of average trains per mile of road.

[fol. 2514] Mr. Mason: To get that for a month, for example, February, 1929, would you then divide by 28?

A. Yes.

Q. So that to get the figure for February, 1929, you take first the total train-miles eastward between Sparks and Ogden?

A. That is right.

Q. And divide by the number of road-miles?

A. That is right.

Q. And divide again by 28?

A. That is right.

Q. Why did you divide by 28?

A. In order to reduce the trains per month to the trains per day.

Q. And in October you divide by 31?

A. That is right.

Q. Of course to get the westward movement you would perform the same operation on the westward train-miles?

A. That is right.

Q. Taking the territory between Yuma and Lordsburg, if a train is operated from Yuma intended to go to Phoenix, would you take into account the train-miles between Yuma and the junction at Wellton?

[fol. 2515] A. No, on the form S-1232 there is a district, Yuma to Tucson via Phoenix, so that those trains which also operate from Phoenix to Tucson would be excluded.

Q. Suppose that a train was operated from Phoenix to Tucson and then went on from Tucson to Lordsburg, would it be in here so far as it operated from Tucson to Lordsburg?

A. Yes, it would. May I make this observation, that it seems as though there is a lot of arithmetic mixed up in this exhibit, but really all it means is that on any one mile of railroad between Yuma and Lordsburg, for instance, there was an average during February, 1928, of three trains east and 2.77 trains west. If you had been standing at any one point, three trains would have passed you going east and 2.77 trains would pass you going west; and the exhibit is designed to give a conception of density of traffic in number of trains operated per day.

The Court: Of course, getting back to the question which I asked be stricken, that means trains reaching Tucson eastbound, if they were routed for your El Paso southwestern route, are not shown on the exhibit because it merely states "Yuma to Lordsburg"?

[fol. 2516] A. Yes.

Mr. Mason: I don't know that I have offered Exhibit No. 191; if not, I now offer defendant's exhibit No. 191 in evidence.

Mr. Strouss: I object to it as irrelevant and immaterial.

The Court: Objection overruled, it may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 191.")

Mr. Mason: Your Honor, I am about to pass to another exhibit which might take some time. I am perfectly willing to continue, but if Mr. Strouss wants to get back tonight—

The Court: Yes, the court will be at recess until Tuesday morning, January 21, at 10 A. M.

(Thereupon the court stood at recess until 10 A. M., Tuesday, January 21, 1941.)

[fol. 2517] January 21, 1941, Ten o'clock A. M.

All parties being represented as heretofore noted, proceedings were resumed at this time as follows:

The Court: You may proceed.

Mr. Mason: Your Honor may recall that on November 27th, when Mr. Kirk of the Missouri Pacific was on the stand, there were offered for identification but not in evidence at that time, Exhibits Nos. 24 and 25, Exhibit 24 being in one sheet and entitled, "Missouri Pacific Railroad Company, Freight Operating and Freight Transportation Expenses Related to Traffic, Calendar Years 1922 to 1939, Inclusive," while Exhibit No. 25 is entitled, "Missouri Pacific Railroad Company, Freight Service Operating Averages, Calendar Years 1922, 1924, 1926, 1928, 1930, 1932, 1934, 1936, 1938 and 1939." Your Honor, Mr. Kirk has returned to Tucson for the purpose of supplying certain underlying documents which had to do with the preparation of another succeeding exhibit, No. 26. We had planned to have come with him at this same time an accounting officer of the Missouri Pacific, who would bring with him the annual reports Form A to the Interstate Commerce Commission and the Forms OS-A and Forms OS-E used in [fol. 2518] preparation of Exhibits Nos. 24 and 25. The witness whose attendance was planned died very suddenly last week, and we haven't made any arrangements as yet for another witness. However, I have discussed with Mr. Strouss the matter of stipulating to the sources of the information shown on Exhibit 24, and as to certain questions which might be asked and answered as to those exhibits with the thought of dispensing with the necessity of bringing on such an accounting witness, much in the same manner as we stipulated with reference to Mr. Porter of the New York Central, and the stipulation that we have discussed and which I think is satisfactory with Mr. Strouss, that as to Exhibit 24 for Identification, it may be understood that the information shown on the face of the exhibit in columns C and D, represents the total—first, as to column C, represents for each year the total of the amounts shown as freight expense and apportioned to freight expense to accounts 201 to 462, inclusive, of Schedule 320, Railway Operating Expenses of the Missouri Pacific, for each of the years shown, that as to column D, the figures represent

the total of accounts 371 to 420, inclusive, as apportioned to freight operating expense, also a part of schedule 320 of [fol. 2519] the Annual Report to the Interstate Commerce Commission for the Missouri Pacific for each of the years as shown. Is that correct, Mr. Strouss?

Mr. Strouss: That is correct.

Mr. Mason: These in column D are the total of the figures in Accounts 371 to 420, freight transportation expense, as—transportation rail line as apportioned to freight transportation expense. Now, as to Exhibit No. 25, it is stipulated that the variation in the total of miles of line operated in freight service as shown in Item 1 of that exhibit has varied as between the years shown, and particularly has decreased in 1939 as compared to prior years, when the figure was greater, because of the abandonment, largely because of the abandonment of unprofitable branch-line mileage.

Mr. Strouss: With that stipulation we will waive our objection based on the grounds that the basic records were not produced.

Mr. Mason: Reserving the objection as to the relevancy and materiality

Mr. Strouss: Yes.

Mr. Mason: I offer the exhibits in evidence subject to the [fol. 2520] objection as to relevancy and materiality.

The Court: The objection as to relevancy will be overruled. Exhibits 24 and 25, heretofore marked for identification, may now be admitted in evidence.

(Thereupon, the documents referred to were received in evidence and marked, respectively, as Defendant's Exhibits Nos. 24 and 25.)

Mr. Mason: Now, as to Exhibit 26, as I said before, Mr. Kirk is here. I will now recall him to the stand, in connection with Exhibit No. 26.)

[fol. 2521] Mr. Mason: I will recall Mr. Kirk who has been previously sworn and testified.

W. F. Kirk was recalled as a witness in behalf of the defendant and having been previously sworn testified further as follows:

Direct examination (Continued).

By Mr. Mason:

Q. Mr. Kirk, on your previous appearance on the stand in connection with exhibit No. 26 which was then offered and received in evidence subject to objection, you testified that the records from which the exhibit was taken were not in court, those records being as you previously testified the dispatchers' train sheets for the districts and covering the dates shown on the exhibit and the profiles of record in the engineering department. I will ask you now if you have with you and present in the courtroom the dispatchers' train sheets from which is taken the information shown on exhibit No. 26 and likewise the profiles of the Missouri Pacific between the points shown?

A. I do, the train sheets are in those bundles there and the condensed profile is here.

[fol. 2522] Mr. Mason: Your Honor, we now tender for the examination of opposing counsel the train sheets and condensed profiles concerning which the witness has just testified.

Mr. Strouss: I would want to go over those; I will try and do it tonight.

Mr. Mason: We will ask Mr. Kirk to withdraw then pending your examination of the profiles. Have you any other questions you wish to ask him at this time?

Mr. Strouss: Not at this time.

The Court: Are you offering it in evidence at this time?

Mr. Mason: Your Honor, the exhibit was received in evidence but at page 448 the Court indicated a serious doubt in his mind as to the admissibility and we are undertaking to allay that doubt and supply the missing records.

The Court: Very well. You may step aside, Mr. Kirk, and be cross-examined later.

(Witness excused.)

Mr. Mason: Your Honor, at page 1987 of the transcript during the cross examination of Mr. Mahoney on January 8th of this year there was offered in evidence the book of

the Santa Fe entitled "Instructions for Operating and Maintaining Air Brake Apparatus," being Form 2591 [fol. 2523] Standard, published by the Santa Fe. At that time Mr. Mahoney agreed to supply additional copies of the book so that one copy might be made of record as an official exhibit and additional copies supplied to counsel and the Court. Mr. Mahoney has now supplied us with four copies of that book.

Mr. Strouss: Mr. Mason, in talking with Mr. Booth after that, we had sort of an understanding that each side would indicate the parts of the book that they wanted in evidence so as not to encumber the record with a lot of stuff that was not necessary. Did Mr. Booth talk to you about that?

Mr. Mason: No, I don't recall that he said anything to me directly about that. The book was received in evidence as exhibit No. 152.

Mr. Strouss: That is true, but he and I were talking about it later.

Mr. Mason: I suggest, then, that each of us go through the book in due course and we can stipulate to withdraw the book and substitute as exhibit No. 152 such excerpts as we severally consider should be part of the evidence.

The Court: Gentlemen, I think that should be done. We surely don't want to encumber the record with the entire book, a large portion of which will have no bearing on this [fol. 2524] case.

Mr. Mason: The printing and reproduction of this book as part of the appeal would be a terrific expense and largely useless. Shall we withhold the offer until the book has been severally examined and the parts indicated and we can have those parts copied.

Mr. Strouss: That is agreeable with me.

Mr. Mason: I will supply a copy of the book to the clerk which will be No. 152 for the time being.

Mr. Strouss: When we have determined the parts each desire, we can stipulate it into the record.

The Court: My recollection is, as the record now stands, the entire book is marked as an exhibit in evidence.

Mr. Mason: It is, yes. Mr. Mahoney was also asked at that time to supply copies of the operating timetables or more correctly identified as the employees' working timetables for the New Mexico division of the Western lines, the Albuquerque-Arizona-Los Angeles divisions of the

Coast lines, and a group of working timetables was given exhibit No. 153. He has now supplied us with several copies of these working timetables and I suggest that the entire group be physically made a part of the record as exhibit [fol 2525] No. 153.

The Court: Without objection, that may be done.

Mr. Mason: At page 1992, Mr. Mahoney was asked to supply the consists of passenger trains during the summer months for the past year, 1940, and agreed to supply them. The request was made by Mr. Strouss and it was then stated by myself that we could introduce the consists as an exhibit with an appropriate number at the time they were received. Mr. Mahoney has now supplied us with a mimeographed publication of several sheets, twenty-three pages including the title page, showing the consists as of June 2, 1940, of his passenger trains. This is a publication which as the title page shows is issued by Mr. Mahoney himself. I think it will be exhibit No. 192.

The Court: It may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 192.")

Mr. Mason: Mr. Mahoney also stated in his letter with which he forwarded this material it should be understood, and I think Mr. Strouss will agree, that the consists as shown in this publication of consists are the minimum consists of these particular schedule trains.

[fol 2526] Mr. Strouss: Yes.

Mr. Mason: I will recall Mr. Sines.

B. S. Sixes was recalled as a witness in behalf of the defendant and having been previously sworn testified further as follows:

Direct examination (continued).

By Mr. Mason:

Q. Mr. Sines, I think at the conclusion of the last session you had completed your discussion of exhibit No. 191, had you not?

A. That is right.

Q. Have you now before you a statement in one sheet entitled, "Gross Ton Miles per Train Hour and Net Tons per

Train, Salt Lake Division, Tucson Division and Pacific Lines"?

A. I have.

Mr. Mason: We ask that that statement be marked for identification as "Defendant's Exhibit No. 193."

The Court: It may be marked.

The Clerk: Defendant's exhibit No. 193 for identification.

Mr. Mason:

Q. Was this exhibit prepared by you or under your direc-
[fol. 2527] tion?

A. It was prepared under my direction.

Q. From what sources?

A. From the Southern Pacific form 521.

Q. As to years prior to 1928 was the same form used?

A. Form 522 was used prior to the year 1928.

Q. The exhibit appears to consist of both a chart as well as a series of figures. Are the figures shown in the various blocks taken directly from the forms 522 and 521?

A. They are.

Q. What relation do the blocks bear to the figures?

A. The blocks indicate by their height the relationship existing between the figures.

Q. Are the blocks drawn to scale?

A. The blocks are drawn to the scale indicated at the left-hand side of the chart.

Q. How are the blocks related to the particular divisions or to the entire line?

A. In accordance with the legend appearing at the bottom of the sheet, the full black indicating the Salt Lake division, the hatched block indicating the Tucson division, and the blank block indicating the Pacific lines.

[fol. 2528] Q. Why was the showing confined to the years since and including 1923?

A. This information was not compiled prior to 1923.

Q. Has the exhibit been compared with the original sources?

A. It has.

Q. Are these the same original sources which were either furnished or agreed to be made available to Mr. Strouss in earlier testimony?

A. They are.

Q. Will you say whether or not the showing on the exhibit is true and correct?

A. It is.

Q. Will you explain the—first of all, the purpose of the showing in the upper block, in general terms?

A. The purpose of the showing in the upper block is to demonstrate the result of the increased train loading on the Salt Lake Division in comparison with the result of a fixed train loading on the Tucson Division in terms of gross ton-miles per train hour. These figures are available for the main lines, for the two divisions and for the System, so the branch lines were excluded.

Q. And what is the purpose of the lower block of the [fol. 2529] exhibit?

A. The purpose of the lower block is the same as for the upper block, but the comparison is expressed in another unit, net tons per train, net tons being the amount of load, pay load, and non-revenue load carried in the train, and is to indicate the advantage which the Salt Lake division obtains by increased train loading as compared with the train loading held at practically the same level on the Tucson division.

Q. Now, I refer you to Mr. Herbert's exhibit No. 178. Have you a copy of that at hand?

A. Yes.

Q. Perhaps it would be better to refer to exhibit No. 180, where there is a somewhat similar showing.

A. All right.

Q. I will ask you whether or not your exhibit No. 193 is to be read in connection with the showing of cars per train year by year for the two divisions and for the Pacific Lines as indicated by the center block of exhibit No. 180?

A. Yes, there is a direct relationship between the cars per train shown on Exhibit 180, and the train loading expressed in the two units shown on my exhibit No. 193.

[fol. 2530] Q. Now, the gross ton-miles takes into account what particular totals?

A. It takes into account the tonnage of the train and speed of the train.

Q. Well, does it take into account the tonnage of the locomotive?

A. No, it does not.

Q. Does it take into account the weight of the cars as well as their contents?

A. Yes.

Q. And when you speak of the speed of the train, to what particular feature of the showing on the upper block of this exhibit do you refer?

A. Referring to exhibit

Q. 193.

A. In miles per hour.

Q. Now, when you speak of net tons per train, I think you said it referred to the pay load.

A. And the company freight.

Q. Does the showing in the lower block exclude the weight of the equipment itself?

A. It does.

Q. Is this, in other words, the contents of the car?

A. That is right.

Mr. Mason: Have you any questions, Mr. Strouss, before [fol. 2531] the exhibit is offered?

Mr. Strouss: This is just the main line operations?

A. That is right.

Q. Does it include, so far as the Tucson division is concerned, the line through Phoenix?

A. It does, yes.

Q. What lines in the Salt Lake division? Is there any other than that between Sparks and Ogden?

A. Yes, the Fernley Line from the end of the Salt Lake Division at Alturas to Fernley. That is classified as main line on the Salt Lake Division.

Q. It does not include, of course, the so-called South line in Arizona, the Tucson-Douglas line, that is part of the Rio Grande division?

A. No, but only because it is not part of the Tucson division.

Mr. Strouss: Yes.

Mr. Mason: This exhibit shows the divisions year by year, as I understand it, Mr. Sines, although division limits may have been changed in intervening years?

A. That is true, and there was a change in the Tucson division limits in 1930 when the east end of the Tucson division was moved from Tucson to near Lordsburg.

[fol. 2532] Q. Does it also include any changes that may have been made in the Salt Lake division by naming a line as main line which was formerly branch line?

A. In November, 1929, the Fernley line was placed in main line service. Prior to that time it had been a branch line.

Mr. Strouss: Just to get this clear in the record, now, prior to 1931, what lines were included in the Tucson division?

A. Prior to July 1930?

Q. 1930.

A. The lines included in the Tucson division extended from Yuma to Tucson via Gila and from Wellton to Picacho via Phoenix, and the end of the Tucson division was located about, well, a few miles east of Tucson, just two or three miles east of Tucson.

Q. And in 1929, the Fernley line was made a main line on the Salt Lake division. What was the Salt Lake division prior to that, what lines were included?

A. Prior to November, 1929, the main line on the Salt Lake division extended from Lawton, Nevada, to Ogden, Utah, and in November, 1929, the Fernley line which, prior [fol. 2533] to that time had been a branch line, was thrown open to through main line service as a part of the route from Oregon, and that part of the Fernley Line between Fernley and Alturas belonging to the Salt Lake division was made a part of the Salt Lake division main line.

Mr. Strouss: That is all.

Mr. Mason: We offer the exhibit in evidence as Defendant's Exhibit No. 193.

Mr. Strouss: Objected to as irrelevant and immaterial.

The Court: The objection is overruled, it may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 193.")

The Court: Mr. Sines, in examining this exhibit No. 193, I note that in the upper block practically without exception the Tucson division reached a higher level than the Pacific main lines, whereas, in the lower block, with the exception of the first three years, the Pacific Lines reaches a higher level than the Tucson division. Is that same showing made on Exhibit 180, I mean is that reflected there?

A. No, that is not apparent on Exhibit 180.

Q. Well, how do you account for that condition in this [fol. 2534] lower block?

A. The difference in loading characteristics of the business handled on the Pacific Lines as a whole, as compared with the particular business which is handled on the Tucson division, a large part of which consists of relatively light-load perishables from California and Arizona eastbound.

Mr. Mason: Has the exhibit been received?

The Court: Yes.

Mr. Mason: Mr. Sines, does the average loading of the cars handled in main line traffic enter into the showing in the lower block of Exhibit No. 193?

A. Yes.

Q. Just in what way does the actual loading of the car affect the showing on the lower block?

A. The perishable business across the Tucson division during the entire seventeen years shown on the exhibit has bulked large in the tonnage handled on that division, but the loading on the System as a whole is influenced by lumber loading in California and Oregon, by petroleum products, and the average per car on the System, average net tons per car on the System has shown a greater fluctuation than the average net tons per car on the Tucson division.

[fol. 2535] Q. Now, you spoke of the influence of perishable loading on the net tons per train. Is that because the perishables load on the average less tons per car than other types of nonperishable freight?

A. Yes.

The Court: Well, do I understand then, Mr. Sines, that in computing the gross ton-miles per train hour, eliminating the locomotive, that includes, I take it, the gross weight of the train itself, that would be the cars and the contents of the cars?

A. Yes.

Q. Whereas, in the lower block the net tons per train, that merely includes the load of the car?

A. Yes.

Q. Rather than their gross weight?

A. That is right.

Mr. Mason: Now, Mr. Sines, has the influence of preponderant perishable business, which you have mentioned for the Tucson division, in any way affected the net tonnage per train on the Salt Lake division?

A. That same influence would be felt on the Salt Lake division, but it would be less marked because the lumber [fol. 2536] business that I mentioned eastbound, originating in Oregon and California, moves eastward to a greater extent over our Ogden route.

Q. Would ore loading, if there is any substantial amount of ore, or concentrates, affect the net tons per train?

A. Yes, and there is an ore movement on the Ogden route between Cobre and Ogden.

[fol. 2537] Q. Is there also a movement of ore or other heavy loading commodities on the Tucson division?

A. Yes, out of Gila and Tucson.

The Court: What does that consist of?

A. Concentrates from Ajo.

Mr. Mason:

Q. What is the reason that there are more net tons per train in the years since 1926 particularly on the Salt Lake division than on the Tucson division?

A. There are more cars per train on the Salt Lake division than there are on the Tucson division, which permits us to build up the net ton load per train on the Salt Lake division.

Q. What is the reason for the showing of more gross ton-miles per train hour on the Salt Lake division since the year 1924 than on the Tucson division?

A. Once again that is the result of a greater number of cars per train on the Salt Lake division.

Q. What is the reason why the gross ton-miles per train hour on the Tucson division is indicated as being somewhat heavier or greater in each year than for Pacific lines as a whole?

A. The factors influencing that are found on exhibit No. 180 where in the first block is shown the average speed in miles per hour on the Tucson division as somewhat higher [fol. 2538] than the average speed in miles per hour on the Pacific lines and the average loading in cars per train on the Tucson division is slightly higher than the average on the Pacific lines although that would be influenced by the factor which we have discussed heretofore of loading per car. The net result of those three factors, cars per train, net tons per car, and speed in miles per hour, is shown in the first block

on exhibit No. 193, and even there it will be noticed that the years subsequent to 1936 show the Pacific lines closer to the Tucson division than we were at the beginning back in 1923, 1924, and 1925.

Q. I wish you would refer to Mr. Masson's exhibit No. 165. Have you a copy of that?

A. Yes.

Q. I will ask you to refer to the first block of his exhibit headed with the figure (1), "Freight Revenue per Freight Service Train Mile," and ask you whether the showing of net tons per train as between the Tucson and Salt Lake divisions finds any reflection in the comparative figures of revenue per train-mile for the states of Nevada and Arizona as shown on that exhibit?

A. Yes, the freight revenue per train-mile shown on ex-
[fol. 2539] hibit No. 165 is a direct product of the loadings expressed in net tons per train shown on exhibit No. 193.

Q. Just why is that? Is the revenue related to the amount of freight in the train?

A. That is right, it is. I want to call attention to the fact that exhibit No. 165, starting about the year 1929 in the columns B and D, indicates a close relationship between the Pacific lines and the state of Arizona in freight revenue per train-mile. The explanation for that is found, of course, on my exhibit No. 193 where the net tons per train are very nearly the same. However, starting with the year 1925 the freight revenue per train-mile for the state of Nevada, column C on exhibit No. 165, begins to draw away from the revenue on the Pacific lines and the state of Arizona and thereafter the difference is an increasing difference; the state of Nevada outstrips the Pacific lines and the state of Arizona just as it does on my exhibit No. 193 where the Salt Lake division net tons per train far exceeds the Tucson and Pacific lines loading.

Q. Does that complete your discussion of exhibit No. 193, Mr. Sines?

A. Yes.

[fol. 2540] Mr. Mason: Do you have any questions, Mr. Strouss, on the exhibit?

Mr. Strouss: Not at this time.

Mr. Mason:

Q. Have you a statement in one sheet, Mr. Sines, entitled "Classes and Number of Employees, Tucson Division, Years 1934, 1938, and 1939"?

A. I have.

Mr. Mason: We ask that this statement be marked "Defendant's Exhibit No. 194" for identification.

The Court: It may be marked.

The Clerk: Defendant's exhibit No. 194 for identification.

Mr. Mason:

Q. Did you prepare exhibit No. 194 or cause it to be prepared?

A. I supervised its preparation and had a lot to do with its compilation myself.

Q. You show the sources from which it was prepared. Will you identify those sources, please?

A. The sources are as indicated in the note in parentheses in the title, "Data abstracted from I. C. C. Wage Statistics, Forms A and B, Monthly Report of Employees, Service, and Compensation."

Q. Have you the reports to the Interstate Commerce Commission covering the Tucson division for the twelve [fol. 2541] months of each of the years 1934, 1938, and 1939?

A. I have them in my possession in Tucson and I will have them in the courtroom here at eleven o'clock, about ten minutes from now. I overlooked the fact that I was going to present this exhibit; I intended to bring them over.

Q. Has the information shown on this exhibit been checked from the underlying forms that you have just referred to?

A. It has.

Q. You show in the title the words, "Averaged to Annual Basis." Why is that?

A. That is because the carriers including the Southern Pacific Company make monthly reports to the Commission without making a summary annual report. I undertook to make a summary annual report by averaging the figures reported monthly by our company.

Q. Did you do that by taking a straight average of the figures reported for the middle of each month?

A. Yes, because the count that I have made is the number of employees receiving pay checks—no, my reply should be "No," it is not the averaging number of employees during the month but it is the number of employees receiving [fol. 2542] pay checks.

The Court: Irrespective of the amount of that pay check?

A. Yes.

Mr. Mason:

Q. This is the number of employees who received compensation for personal services to the company during each of the months of each of the three years shown averaged for each year?

A. That is right.

Q. It is not the I. C. C. middle of the month count, then?

A. No.

Q. It is the payroll count?

A. That is correct. There are two bases on these forms, A and B, reported to the Interstate Commerce Commission. One is the middle of the month count that you speak of and the other is the number of employees receiving pay checks, which I used as the basis.

Q. Have you checked the computations by which these average figures were determined?

A. I have.

Q. Will you say whether or not that is a true and correct reflection of the figures appearing in the underlying documents as summarized by computation in the manner you have described?

[fol. 2543] A. It is.

Mr. Mason: Have you any questions on the exhibit, Mr. Strouss?

Mr. Strouss: No, I have no questions.

The Court: This includes branch lines as well as main line?

A. Yes, sir.

Q. What year was the main line completed to Phoenix?

A. It seems to me it was 1926.

Mr. Mason: It was placed in service approximately the first of November, 1926, was it not?

A. I don't recall. We have a record of it.

Mr. Strouss: I think it is in the record already; it seems to me it was 1925. Why did you take the years 1934, 1938, and 1939?

A. A year ago we were preparing for a case which we thought we might have in the Federal court. 1938 was the last complete year at that time. Then I went back five years to 1934 to show how many we had in 1934 and last year I just added another year to the showing.

Mr. Strouss: You don't have that for the periods prior to that, say, 1929 and 1925?

A. I haven't it worked up, but the records are available. I don't have those records in Tucson, but they are available [fol. 2544] in our San Francisco office.

The Court: Would it be quite a job to prepare this exhibit, Mr. Sines?

A. Oh, yes, the work sheet has to show columns of figures for every one of the twelve months of the year and then they have to be computed across and footed and totaled.

Mr. Mason:

Q. You have undertaken here to show by the number and classification. Does that involve additional computation?

A. Yes, each classification is a computation in itself, of course.

Mr. Mason: We offer the exhibit as defendant's exhibit No. 194.

Mr. Strouss: Just one other question. 1934 was in a sense an abnormal year because you were more or less in a period of depression so far as volume of business is concerned?

A. That is right, we were experiencing a mild recovery by 1934.

Mr. Strouss: I object to it as irrelevant and immaterial.

The Court: Objection overruled, it may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 194.")

[fol. 2545] Mr. Mason:

Q. Mr. Sines, is it possible to make from the face of this exhibit a computation of the number of employees directly engaged in train service as opposed to yard service?

A. It is.

Q. You made that computation for the year 1939?

A. I haven't made the computation but the figures are on the face of the exhibit and can be determined by inspection. Looking at line 42, we find enginemen-yard service for the year 1939, 50.

Q. That includes both engineers and firemen, does it?

A. Yes. Line 46 shows trainmen-yard service for the year 1939, 115. Adding those two together, we have 165 men employed in yard service; deducting 165 from 809 leaves 644 employees engaged in other transportation services.

Q. You speak of 644, that includes engineers and firemen, conductors and brakemen, does it?

A. Yes.

Q. And only those classes?

A. Only those classes.

Q. It does not include any officials such as the assistant superintendent or train master or road foreman of engines who ride the trains?

A. No.

[fol. 2546] Q. Or any yard employees at all?

A. No, they are taken out in the 165.

The Court: We will take our mid-morning recess at this time.

(Thereupon a short recess was taken, after which proceedings were resumed as follows.)

[fol. 2547] The Court: You may proceed.

Mr. Mason: Mr. Sines, referring to exhibit No. 194 further and particularly to transportation employees, I think you gave the figure of 644 as those who were in all train service, is that correct?

A. That is correct.

Q. Now, have you a further subdivision of those employees as between passenger service and freight service?

A. Yes; passenger-service employees are shown in line 39; with 47 for 1939, and line 43 with 49 for 1939, gives us a total of 96, subtracted from 644, leaves 548 employees in through and local freight service.

Q. Now, those 96 are the employees who manned the train subject to the 14-car limitation, is that right?

A. That is correct.

Q. Now, as to the freight service, have you a subdivision as between through freight service and local freight service?

A. Yes: local freight service employees are shown in line 41 with a total of 17 for 1939, and line 45, 32 for 1939, giving the total of 49; subtracting that from the 548 leaves 499 [fol. 2548] employees in through freight service.

Q. And that is the total of lines 40 and 44, is it?

A. That should be the total of lines 40 and 44, and it is 499.

Q. Now, are those 499 employees who manned the trains affected by the 70-car limit law?

A. Yes, they are. I suppose that some of the local trains operating on the main line occasionally have their length governed by the 70-car law, but those on the branch lines, it would be infrequent that the 70-car provision became a factor in those trains, so that the 499, by this process of deduction we have arrived at 499 as the number of those who are directly affected by the 70-car limit of the Arizona law; and I want to call attention to the fact that this 499 compares with a total of all employees on the Tucson division of 2,693.

Q. You have 499 employees in through freight train service, and 96 in passenger service, that is that correct, on the Tucson division?

A. Yes.

Q. A total of 595?

A. Yes.

Q. Who manned the trains affected by the fourteen or [fol. 2549] 70-car limitation?

A. Yes.

Q. Excluding for the moment local freight service?

A. Yes.

Mr. Mason: Have you any questions on Exhibit 194 at the present time?

Mr. Strouss: No.

Mr. Mason: Mr. Sines calls my attention to the fact that he now has in the court room the monthly reports of employees, service and compensation, rendered by the com-

pany to the Interstate Commerce Commission, and covering the Tucson division for the year 1939, which are, for the year 1939, the underlying documents testified to by him as being used in preparing exhibit No. 194, and we offer those for the examination of opposing counsel.

The Witness: I am sorry to say they have only the year 1939, the other two years are still not in the court room.

The Court: You will produce them this afternoon.

Mr. Mason: I will make the further statement that as to the balance, we will produce those as soon as possible and [fol. 2550] probably at the afternoon session.

Q. Is that all that you have at this time on No. 194, Mr. Sines?

A. Yes, sir.

Q. Have you a statement in six sheets, or, rather, an exhibit in six sheets, the initial page of which bears the title, "Interstate Commerce Commission Orders Concerning the Matter of Method and Form of Records to be Kept by Carriers Relating to the Time on Duty of Employees and the Movement of Trains"?

A. I have.

Mr. Mason: May we have this exhibit marked as Exhibit 195 for identification?

The Court: It may be marked.

The Clerk: Defendant's Exhibit No. 195 for identification.

Mr. Mason: Now, of what do the first four pages of Exhibit No. 195 for identification consist, Mr. Sines?

A. The first four pages——

Q. The first four sheets, I should say?

A. The first four sheets consist of reproductions of an order of the Interstate Commerce Commission.

Q. Aren't there in fact two orders, one dated May 2, [fol. 2551] 1921, and the other dated February 13, 1922?

A. That is right.

Q. And are these the photostatic reproductions or the equivalent of photostatic reproductions of the text of the Commission's orders?

A. They are.

Q. And are they the entire orders of the Commission? Have you made any omissions?

A. No, with respect to the subject matter covered by the orders, these are the entire orders.

Q. Now, what is sheet 5 of Exhibit 195 for identification?

A. Sheet 5 is the Southern Pacific adaptation of the Interstate Commerce Commission's order shown on sheet 2 of the exhibit. The title of the report is "Time Return and Delay Report of Engine and Train Employees" in both cases.

Q. Is this form a form regularly and continuously used by Southern Pacific employees?

A. It is.

Q. Is it a form rendered to the Commission and thereafter kept in the Company's records?

A. It is.

Q. Who renders the report?

A. The conductor in charge of each train crew.

Q. Is a similar report rendered by engineers where there [fol. 2552] is a movement not in charge of a conductor?

A. The conductor is in charge of each train crew for the train service employees and the engineman in charge of each engine crew, which consists of an engineman and fireman for the engine crew. Occasionally, there is a flagman who may work on one or more trains and who may render his own time return and delay reports. That is very occasional, however.

The Court: But do I understand that in the normal train operations with the average crew, that it is only the conductor that makes the reports?

A. No, both the engineer and the conductor.

Q. But the other individual employees such as your brakeman or fireman wouldn't submit an individual report?

A. No.

Mr. Mason: Now, as to sheet No. 6 of exhibit No. 195 for identification, what is that?

A. That is the Southern Pacific adaptation of the Interstate Commerce Commission's order shown on sheet 4 of the exhibit and is the dispatcher's record of movement of trains, commonly referred to as the dispatcher's train sheet.

[fol. 2553] Q. And this particular adaptation, which forms a part of this exhibit, is it associated with any particular district or territory?

A. It is for that part of the Tucson division between Gila and Tucson, and Tucson and Lordsburg, the territory being divided into such train districts for convenience in

handling train sheet, and also because those are the freight districts upon which freight trains operate.

Q. Do you know and, if so, will you state whether this form of train sheet which is reproduced as Sheet 6 of Exhibit 195 is in regular and daily use on the Tucson division?

A. Yes, it is.

Q. Have you seen it in use?

A. Yes.

The Court: This sheet is similar but on a smaller scale to the train dispatcher's sheet herefofore marked for identification in this case, but not admitted in evidence?

A. That is right.

Mr. Mason: I will ask you this, Mr. Sines, if sheet 6 of Exhibit 195 for identification is a reproduction in exact size or reduced size?

A. It is a reduction.

Q. Why was the reduction made?

[fol. 2554] A. Simply to cut down the bulk of the exhibit.

Q. For convenience in reproduction, or presentation here?

A. Yes.

Q. Has the material in Exhibit 195 been checked against the sources which it purports to reproduce?

A. It has.

Q. Will you say whether or not it is a true and correct reproduction of the matter which it purports to reproduce?

A. It is.

Q. What is the purpose of reproducing the Commission's orders and the blank forms?

A. The purpose is to indicate the sources and the types of information which forms the basic record of train movements, and of service by the train service employees.

Q. Are these orders reproduced on Exhibit 195 for identification the latest orders of the Interstate Commerce Commission pertaining to this subject?

A. They are.

Q. Are they the orders now in effect?

A. They are.

Mr. Mason: Have you any questions, Mr. Strouss?

[fol. 2555] Mr. Strouss: No questions.

Mr. Mason: We offer the exhibit in evidence as Defendant's Exhibit 195.

Mr. Strouss: No objection.

The Court: It may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 195.")

Mr. Mason: Mr. Sines, reverting back for a moment to Exhibit 194, do you now have with you the reports of employees, service and compensation, for the years 1934 and 1938 for the Tucson division?

A. Yes, I have, and I have delivered them to Mr. Strouss.

Q. Mr. Sines, have you made or supervised the making of any study or studies for the purpose of determining upon the character of the operations which would be conducted by the Southern Pacific Company if the law were not in effect?

A. I have.

Q. Briefly, what is the short title or short name of those studies?

A. A redispatching study.

Q. Precisely what do you mean, first, in general terms, by "redispatching study?"

A. A redispatching study consists of a detailed analysis [fol. 2556] of each of the freight and passenger trains actually operated to determine the consist, that is, the number of cars and contents, their destinations, the amount of local work to be performed by each of the trains, to determine also other factors having a bearing upon the operation of the trains, such as weather conditions, the amount of interference from trains traveling in the opposite direction, also trains which may pass and be passed, and all other essential features of operations of trains, and, having determined all such factors, the redispatching study also consists of the complete rearrangement into redispatched trains of the cars and traffic actually moved so as to conform the operations to conditions which would have obtained if the law were not in effect.

Q. Did you for the purposes of the present case make more than one such study?

A. I did.

Q. How many redispatching studies did you make or supervise?

A. Six.

Q. Have you an exhibit in one sheet which lists briefly the studies so made?

A. I have.

[fol. 2557] Q. Will you state the title of the exhibit which has been referred to?

A. "Redispatch and Other Studies Made to Determine Effect of Arizona Train Limit Law on Freight and Passenger Operations."

Mr. Mason: May we have this statement marked as Defendant's Exhibit No. 196 for identification?

The Court: It may be marked.

The Clerk: Defendant's Exhibit No. 196 for identification.

Mr. Mason: Mr. Sines, did you prepare Defendant's Exhibit No. 196?

A. I did.

Q. For the purpose of giving a short summary of the studies undertaken and indicating their nature and period?

A. Exactly.

Q. Did you prepare the exhibit personally?

A. I did.

Q. I take it that in your further testimony you will go into each item and explain it in more detail?

A. I will.

Mr. Mason: Have you any questions, Mr. Strouss?

Mr. Strouss: No.

[fol. 2558] Mr. Mason: I will say that the exhibit is merely offered as a convenient way of summarizing and placing on one sheet and in one place the several studies concerning which the witness will testify personally. We offer the exhibit as Defendant's Exhibit No. 196.

Mr. Strouss: Objected to as irrelevant and immaterial.

The Court: The objection is overruled. It may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 196.")

Mr. Mason: Mr. Sines, will you state how you first came to undertake any redispatching studies for the purpose of Arizona operations?

A. I was detached from my regular assignment as an executive assistant on the president's staff, and placed in charge of the redispatching studies which were about to be made in connection with an action which we filed in the Federal Court in the spring of 1939.

Q. When were you actually detached from your regular assignment and assigned to the preparation of that particular case?

A. May 1, 1939.

Q. Now, did you in that connection have any conference [fol. 2559] with officials of other departments preliminary to undertaking the actual studies?

A. Yes, at various times during that month I had conferences with representatives of the vice-president of operations, Mr. J. H. Dye, who testified here last week.

Q. Did you also confer with your fellow officers in the executive department?

A. Yes, and with members of the mechanical department, also.

Q. With whom particularly did you confer in the executive department?

A. Mr. V. S. Andrus, manager of the Bureau of Transportation Research, who is also a member of the president's staff.

Q. What were the reasons for holding these prior conferences?

A. In order to determine what the plan of operation would be in Arizona in event the Arizona Train Limit Law were set aside.

Q. Was it necessary to determine what character of locomotives or motive power should be used?

A. Yes.

Q. What other factors were particularly essential to determine for the purposes of your study?

[fol. 2560] A. There were three essential elements that had to be determined immediately. One of them was the locomotives which you have mentioned, and the other was the length of freight train which would be operated in each direction, because the length of the individual freight train depends upon the locomotive, and a third factor was the length of siding, the physical plant which would be provided for the operation of the trains in the territory.

Q. Did you have to make any determination as to the revision or rebuilding of engine house or roundhouse facilities?

A. Yes, that was considered subsequent to the choice of the locomotive.

Q. In connection with the siding extensions, did you have to decide where they should be placed?

A. Not as a result of those preliminary conferences; that came along later.

Q. Now, as a result of those preliminary conferences, did you yourself reach any conclusion as to the type of locomotive which should be used?

A. Yes.

Q. What type of locomotive was decided upon?

A. A locomotive similar to the articulated Consolidation locomotive which we were then purchasing, and which is commonly referred to as the AC-8. We had some under [fol. 2561] construction, and they were delivered to us late in the summer, and fall, of 1939.

Q. I will ask you to refer if you will, please, to Mr. Russell's Exhibit No. 5, also to his Exhibit No. 7.

A. Yes.

Q. Do you have reference to locomotives similar to the AC-8 referred to on his exhibit No. 5?

A. Yes.

Q. And by reference to Exhibit No. 7, are there any AC-8 locomotives referred to there?

A. Not directly, but they are the 28 locomotive shown in line 43, the 4-8-8-2's.

[fol. 2562] Q. Did you as a result of your conference reach any conclusion as to the length of trains to be operated?

A. Yes, it was decided that the general length of train to fit this locomotive would be one hundred loaded cars eastward between Yuma and El Paso and 125 empty cars westward between El Paso and Yuma.

Q. What about the length of westward trains not consisting of empties?

A. Trains with loaded cars would have their length varied in accordance with the capacity of the locomotive to haul the train, but generally 125 cars would be the maximum train operated.

Q. Were these limits of 100 cars in one direction and 125 in the other set as definite maxima or as mere guides?

A. As guides. There was no hard and fast rule as to the length of trains in either direction, but we generally followed the plan of redispatching 100 cars east and 125 cars west.

Q. Having decided upon the length of trains to be operated in each direction, were you then able to determine upon your siding extensions, if any?

A. Yes, after the redispatching party, the men who performed the redispatching study were called together and [fol. 2563] we reviewed the side-track situation on the Tucson and Rio Grande divisions and picked out those sidings which should be extended in order to permit of a complete long train operation.

Q. Of train lengths such as you have indicated?

A. Yes.

Q. You speak of calling the redispatching party together. Did you undertake to collect a force of assistants to carry on the redispatching study under your supervision?

A. I did.

Q. Of whom did this party consist, referring now to the study which, as you have indicated, was undertaken after your assignment on May 1, 1939?

A. The party consisted of three chief dispatchers in the territory between Los Angeles and El Paso, Mr. J. A. Day, chief dispatcher of the Los Angeles division; Mr. G. C. Baker, who was then chief dispatcher of the Tucson division; and Mr. L. D. Herrell, chief dispatcher of the Rio Grande division. Mr. Baker brought along with him to assist him a trick dispatcher from Tucson and we also had the services of a trick dispatcher who had worked on the Rio Grande division and had dispatched trains on the territory between Tucson and Lordsburg and Lordsburg and El Paso. [fol. 2564] Q. Did you have any clerical help?

A. That was the dispatching force. I had the assistance of Mr. W. T. Herbert, assistant engineer in the Bureau of Transportation Research, and a representative from the timekeeping department, Mr. H. C. Gaverick, and other clerical and stenographic assistance as required. Because of the number of exhibits, charts, and graphs that were prepared, it was necessary to detach a draftsman from the engineering department and assign him to my party also.

Q. I take it you are referring to the redispatching study which is shown as item 1 of exhibit No. 196 and do you have in mind also the item 2 or, the passenger redispatching study?

A. That was made by the same party during the summer of 1939, yes.

Q. Was item 3, the analyses of passenger operations for the year 1938, also made about the same time?

A. Yes.

Q. What as to item 4, the freight redispatching study, Phoenix to Tucson, month of December, 1939?

A. That was made in the fall of 1939 by Mr. Henry Cassady, who had succeeded Mr. G. C. Baker as chief dispatcher of the Tucson division. He joined our party in San Fran- [fol. 2565] cisco and was responsible for the freight redispatching study, item 4, and also assisted in making the passenger redispatching studies, items 2 and 3. I believe Mr. Baker was promoted to assistant superintendent of transportation in the latter part of August.

Q. 1939?

A. 1939.

Q. Were any data and records assembled for the purposes of the studies?

A. Yes.

Q. Will you describe generally what they were?

A. The records that we assembled were the dispatchers' train sheets for the territory Los Angeles to El Paso for the Los Angeles, Tucson, and Rio Grande divisions for the months of June and August, 1938, for item 1, and for the entire year 1938 for items 2, 3, and 4. We also had the conductors' time return and the delay reports for the Tucson and Rio Grande divisions for the entire year 1938. We had the freight conductors' wheel reports for the months of June and August for the Tucson and Rio Grande divisions and for the month of December for the Tucson division. We had the passenger conductors' wheel reports for the entire year 1938. We had the timetables [fol. 2566] which had been in effect during the year 1938 on the Los Angeles, Tucson, and Rio Grande divisions. We had yard records at Yuma and Tucson.

Q. Did you have any terminal delay reports or log books maintained at any of the terminals?

A. Yes, those at Yuma and Tucson.

Q. Were there any files from the dispatchers' offices assembled for the purpose?

A. We had the conductors' daily correspondence and telegraphic files for the entire year 1938 for Tucson and Rio Grande divisions.

Q. You say the conductors', you mean the dispatchers'?

A. The chief dispatchers', yes.

Q. When was the active work of conducting the 1938 redispatching study, item 1, commenced and where?

A. May 15, 1939, the party assembled in Los Angeles.

Q. Did you conduct the study thereafter at Los Angeles or did you move to San Francisco?

A. We worked there for several weeks and determined that the interest of the Los Angeles division and the freight redispatching study was very slight so I then moved the entire party to San Francisco.

[fol. 2567] Q. When was the 1938 freight redispatching study completed, approximately?

A. In September.

Q. Was the party continuously at work from the fifteenth of May until September in connection with the study?

A. It was, yes.

Q. Your exhibit No. 196 indicates that you studied the two months of June and August, 1938. Why were those two months selected for the purpose of the study?

A. June is the month of heaviest traffic and August is the month of lightest traffic for the year 1938 for the territory between Yuma and El Paso, and by studying the heaviest and lightest months I obtained a cross-section of the year's business.

Q. How does the total business handled over the district during the months of June and August, 1938, compare with the business for the year, if you know?

A. The business handled between Yuma and El Paso equalled 17.89 per cent of the year's business handled during 1938.

Q. Is that expressed in car-miles or ton-miles?

A. That computation was made in either car-miles or [fol. 2568] gross-ton-miles. I will have to answer that question specifically after I have looked at one of my exhibits.

Q. You will have an exhibit later which shows the exact relation?

A. It shows the derivation of the 17.89 per cent. One-sixth of the year's business would equal 16.67 per cent; the amount by which these two months depart from an average is slightly over one per cent.

Q. You have stated that for the purpose of the redispatching study you determined certain sidings to be extended?

A. Yes.

Q. Have you prepared an exhibit showing an outline map of the lines between Los Angeles and Tucumcari?

A. I have.

Q. Showing the stations and certain other information?

A. Yes.

Q. Is this a statement in one sheet bearing the title, "Present and Proposed Siding Capacities Expressed in Number of Cars"?

A. Yes, sir.

Mr. Mason: May that statement be marked for identification as "Defendant's Exhibit No. 197"?

[fol. 2569]

The Court: It may be marked.

The Clerk: Defendant's exhibit No. 197 for identification.

Mr. Mason:

Q. Was exhibit No. 197 prepared under your supervision?

A. It was.

Q. What do the figures without circles opposite the names of stations on the map indicate?

A. They indicate the present car capacity of sidings.

Q. What do the figures in circles indicate?

A. They indicate the proposed car capacities or the lengths to which those particular sidings are to be extended.

Q. How did you arrive at the determination of the sidings to be extended and the lengths of the extensions?

A. Our chief dispatchers, that is, Mr. Baker for the Tucson division and Mr. Herrell for the Rio Grande division, indicated the particular sidings which it would be necessary to extend in order to permit a complete long train operation in accordance with our plan of operating 100 cars east and 125 cars west as general train lengths.

Q. Did you make any study jointly with these chief dis-

[fol. 2570]

patchers of the situation on these two divisions?

A. Yes, I examined the employees' time cards and the profiles of the railroad and discussed each case individually with the dispatchers to find out and satisfy myself as to how the particular extensions indicated would fit into the general over-all operating plan.

Q. Are you yourself personally familiar with all or a portion of the line here from having had experience in connection with it?

A. I am intimately familiar with the territory east of Tucson, having worked on the Rio Grande division for eight years. I suppose I have been on the ground at every one of the sidings in that territory during that eight years. I am generally familiar with the territory west of Tucson.

Q. Have you made personal inspections of that territory as well?

A. Yes, both on freight and passenger trains.

Q. Will you say whether or not the showing on exhibit No. 197 represents the lengths of the sidings as they exist or would exist for the purposes of complete long train operation?

A. It does.

Mr. Mason: Have you any questions, Mr. Strouss?

[fol. 2571] Mr. Strouss: No questions.

Mr. Mason: We offer the exhibit in evidence as defendant's exhibit No. 197.

Mr. Strouss: I object to it as irrelevant and immaterial and calling for an opinion and conclusion of the witness and purely speculative.

The Court: I will overrule your objection as to this particular exhibit but I do think from the statements of this witness as to this exhibit some of these matters may be objectionable on the line that you indicate, Mr. Strouss. If I correctly interpret this exhibit, it gives two classes of information: first, it gives the present capacity, does it not, Mr. Sines, of the sidings on the route from Los Angeles to El Paso?

A. It does.

The Court: And then in circles it gives the proposed increases that you would make if it were not for the Arizona Train Limit Law as to those sidings where the circles are shown?

A. Yes, and which had to be made in order to permit us to make our redispatching studies.

The Court: I will overrule the objection as to this exhibit, it may be admitted in evidence.

(The document referred to was received in evidence and [fol. 2572] marked "Defendant's Exhibit No. 197."

The Court: I notice, Mr. Sines, with possibly two or three exceptions on your Douglas route and on the Phoenix route there are no proposed extension of sidings?

A. That is right. There is only one extension on the Phoenix route at Topaz and there are none on the Douglas route. The one which you may think is on the Douglas

route is the one at Conrad, but that is really a station on the north line, three sidings west of Lordsburg.

The Court: We will take our noon recess at this time. The court will be at recess until two o'clock.

(Thereupon at twelve o'clock noon the court stood at recess until two o'clock P. M. this day, January 21, 1941.)

[fol. 2573] January 21, 1941, two o'clock P. M.

Proceedings were resumed at this time as follows:

The Court: You may proceed.

The witness B. S. Sines was recalled to the stand and testified further as follows:

Mr. Mason: Mr. Sines, you have testified as to the fact that your redispatching study contemplated the use of AC-8 locomotives in place of those in use on the division in June and August, 1938?

A. Yes, sir.

Q. For freight service?

A. Yes, sir.

Q. Did you contemplate any change in the locomotives to be used on passenger trains, for the purposes of your redispatch study of the passenger train operations?

A. No, the passenger locomotive assignment was the same in the passenger redispatch study as those used in actual operation.

Q. Now, you have also testified, I think, that certain changes in roundhouse and turntable facilities were contemplated in the redispatching studies?

A. That is right.

[fol. 2574] Q. Why would that be required?

A. Because these AC-8 locomotives are somewhat longer than the locomotives in use, and the turnfables installed at Yuma and El Paso would have to be lengthened to accommodate the longer locomotives. The turntable at Yuma would have to be lengthened but not the one at El Paso, that has already been lengthened.

Q. You have testified that your plan of redispatching contemplated the extension of certain sidings as shown on the exhibit last introduced, No. 197?

A. Yes.

Q. Now, I will ask you whether in the plan adopted for the redispatching study of 1938, you contemplated any changes in the conditions of operation as they prevailed on the divisions in June and August, 1938, other than those that you have just mentioned and, of course, the absence of the 70 and 14-car restrictions?

A. No, there were no other changes in the physical plant or in the equipment contemplated in our redispatch study.

Q. What traffic was studied for the purpose of the redispatching study, of the 1938 freight redispatching study?

[fol. 2575] A. Exactly the same traffic was handled in the redispatch study as the traffic that actually moved over the railroad during those two months.

Q. And how was this traffic handled for the redispatching study? Did you make any difference in the trains in the redispatched trains as between those and the actual trains?

A. The only difference that existed between actual handling and that contemplated under the redispatch study was the length of the train.

Q. Well, was the traffic redistributed into longer trains?

A. The traffic was redistributed into longer trains, yes.

Q. Did the plan contemplate different departure time of the redispatched trains?

A. There were different departure times from intermediate terminals, such as Gila, Tucson and Lordsburg, due to the different arrival times at those intermediate terminals after the trains had worked their way across the railroad from the initial terminals of Yuma and El Paso. The departing times at Yuma and El Paso, eastward trains at Yuma and westward at El Paso, corresponded very closely with the departure times of the trains actually operated.

[fol. 2576] Q. Were there more trains in the redispatching study or less trains than there were in the actual operation?

A. There were less trains on the redispatched study than in actual operation.

Q. At what point did the redispatching of eastbound traffic commence?

A. At Yuma.

Q. At what point did the redispatching of the westbound traffic commence?

A. At El Paso, Texas.

Q. Who was directly and actively in charge of the redispatching of the traffic eastward from Yuma?

A. G. C. Baker, chief dispatcher of the Tucson division.

Q. And who was actually and actively in charge of the redispatching of the traffic west from El Paso?

A. L. D. Herrell, chief dispatcher of the Rio Grande division.

Q. How far did Mr. Herrell handle the redispatched westbound traffic?

A. As far as Lordsburg, New Mexico.

Q. And who received it at that point?

A. Baker.

[fol. 2577] Q. How far did Mr. Baker handle the eastward traffic?

A. From Yuma to Lordsburg.

Q. What was done with it then?

A. It was there turned over to Mr. Herrell.

Q. As the chief train dispatcher of the Rio Grande division?

A. Yes.

Q. Did the redispatching study contemplate any rearrangements of traffic handled on the South line between Tucson and El Paso via Douglas?

A. Yes.

Q. Was this in connection with the study of the North line?

A. Yes, it was carried along simultaneously with the redispatch study which was performed for the North line. Actual operating conditions were simulated from day to day, and Herrell surveyed the entire situation west of El Paso, taking into consideration both the north and south lines and the distribution of traffic which he had originally made in actual operations and which he proposed to redispatch in the redispatch study; likewise, Baker, in redispatching trains from Tucson eastward, took into consideration the distribution which he had orginally made [fol. 2578] between the two lines and redispatched that traffic as between the north and south line.

Q. Well, on what sort of records were the redispatched train movements shown?

A. On train sheets, on fresh train sheets the same as those that are used in the ordinary course of business.

Q. Was a redispatch train sheet made for each day covered by the redispatching study?

A. Yes, exactly the same as is done in actual train operation.

Q. What information, generally speaking, was shown on the redispatch train sheets?

A. The redispatch train sheet shows the identity of the train by designation, that is, whether it is a perishable train, a manifest train, a drag, or a stock train; by its position on the train sheet if is also possible to tell whether it is a freight train or passenger train, the train number, the operating train number was shown, the locomotive number or, rather, on the redispatch study the locomotive type.

Q. Was one number employed to designate all of the locomotives used for the redispatched trains?

A. All the AC-8's were referred to as 4100's. Helpers [fol. 2579] and other locomotives not of the A.C-8 type were indicated by their types but not by individual or specific numbers.

Q. Will you give me an example? Suppose that an F type locomotive was used, would some serial number be used to indicate it?

A. 3600.

Q. Or if a Mikado?

A. 3200.

Q. Were names of crews shown on the redispatch train sheets?

A. I don't know whether the chief dispatcher's breakdown showed crew names or not. They did keep crew books and whether as part of that bookkeeping they used names or numbers or letters, I cannot at the moment, say. An inspection of the train sheets will indicate, however.

Q. Have you at your disposal all the train sheets?

A. Yes.

Q. Covering the redispatching study of 1938?

A. Yes, sir.

Q. As well as those covering the redispatching study of 1940 that you have referred to?

A. Yes.

Q. How did the chief dispatcher, Mr. Baker, handling [fol. 2580] the train sheets at Yuma, find out the consists of the trains or of the traffic to be moved from Yuma by the redispatched trains?

A. In mentioning the records, which we assembled at the beginning of the redispatching study, I said that we had the conductors' wheel reports for the Los Angeles division trains entering Yuma. We took these wheel reports and analyzed them into half a dozen different groups to indicate the character of traffic in the cars. That analysis was made for every train entering Yuma from both the Indio line and also from the Imperial Valley. An individual—rather, a special work sheet was set up for that particular operation. That work sheet showed the train designation arriving and the arrival time of the train in addition to the consist of the arriving train, then loads that orginated at Yuma, or company material such as oil and bridge material which doesn't move on through billing but which may appear for movement at any time at a terminal such as Yuma, were picked off of the switch list of the departing trains. In addition to that, we had the pull record, a book which is kept by the Yuma yard office, indicating the time when perishable loads are ready to move from Yuma. With all this information, Mr. Baker [fol. 2581] then knew what time the cars were available for movement east of Yuma, what time they had moved actually, and then he reassembled or reconstituted and redispatched the business in his new long trains.

[fol. 2582] Q. Was it ever possible to take a train coming from the Los Angeles division into Yuma and move it on eastward into Yuma without change or substantial change of consist?

A. Yes, that was a frequent occurrence.

Q. How did you take care of traffic not moving through beyond points on the Tucson division?

A. As the traffic was picked off of the conductors' wheel reports for the trains actually operating between Yuma and Gila and Gila and Tucson, Tucson-Lordsburg and Lordsburg to El Paso. The conductor's wheel reports show in each instance the destination of the cars that that conductor has handled. That called for another analysis to be made of the conductors' wheel reports and once again statements were made to indicate the short business which the chief dispatcher would have to provide for in redispatching the long trains.

Q. Were you able to rearrange the train service given to those short loads, so-called, short cars?

A. Yes, that was concentrated as much as possible on one train instead of spreading it over several trains.

Q. Why would it be spread over several trains in actual [fol. 2583] handling and possibly concentrated in one train in redispatch handling?

A. With a car limit we have to operate with the idea that business should move whenever the opportunity presents itself, whereas without the limit such compulsion is not as evident, we have an opportunity to let one train do the local work to a greater extent than when there is a limit.

Q. What plan did you follow as to the picking up of business originating at points east of Yuma along the division?

A. There, again, the conductors' wheel reports of the trains actually operated were the sources of information to show the cars picked up enroute by the trains. This information was developed by the dispatcher or given to him by those assisting him and in reconstituting the day's business he would indicate on which trains he wanted the business picked up.

Q. What did the redispatching plan contemplate as to the provision of crews for trains in passing through such terminals as Gila and Lordsburg?

A. The redispatching plan contemplated that exactly the same problems would arise as those that occur in actual operation, that is, that it would be necessary to balance power and crews by double heading engines and dead-head- [fol. 2584] ing crews to the terminals where they were needed or from the terminals to which they had worked but where they were not needed.

Q. When does such dead-heading of crews and double heading of power occur in actual practice?

A. To give a simple illustration, if a chief dispatcher by means of his advance line-ups discovers that within any twenty-four hour period he is going to have [illegible] trains west from Gila and only four trains operating into Gila from the west, he knows that he will have to get an engine and a crew at Gila in order to take care of that fifth train back, otherwise he will be out of balance, so he will very often double head an engine either on a freight train or on a passenger train over to Gila in order to get the engine and the engine crew over there and he will dead head a train crew either on a freight train or on a passenger train over to Gila so that it will be available for this fifth train.

Q. Why is it necessary to send crews to Gila?

Q. Gila is the away-from-home terminal for crews operating in the territory Yuma to Gila.

Q. Is it also the away-from-home terminal for crews operating out of Tucson to Gila?

[fol. 2585] A. That is right. This illustration which I have given would work in the same manner.

Q. Is there any pool or reservoir of trainmen and enginemen other than those who have come in on road trains maintained at Gila?

A. That is all.

Q. What is the situation at Lordsburg?

A. Lordsburg is the away-from-home terminal for crews operating out of Tucson and El Paso.

Q. If a conductor and the brakeman comprising the crew are moved dead-head, say, from Yuma to Gila to protect a westward movement, what about the caboose in which they travel? Is that traveled with them?

A. Yes, that will be sent over on a freight train so as to arrive in advance of their departure also.

Q. You spoke of double-heading locomotives. Is that the only method employed where necessary to get a locomotive to a division terminal to protect an oncoming train?

A. They can run light or with a caboose, with what is known as a "caboose hop," just an engine and caboose together.

Q. Do those instances appear on the train sheets covering actual operations during June and August, 1938, in-

[fol. 2586] stances of dead-heading crews or locomotives?

A. Yes, where the business was unbalanced and it was necessary to provide more crews in one direction than in another, the redispatching study shows that the chief dispatchers did double-head engines and dead-head crews.

Q. Was that the same general practice as is followed in actual operations?

A. Exactly the same.

The Court: Do I understand, Mr. Sines, when this extra engine is sent over to this terminal to take care of the balancing of this traffic, that the engineer and fireman do not ride that engine, that is just pulled as a car would be?

A. No, sir, the engineer and fireman operate the engine.

Q. It steams up?

A. Oh, yes.

Q. You really have two engines then on that train?

A. Yes, sir.

Q. You would still call that dead-heading?

A. No, that is double-heading. You only dead-head——

Q. (Interrupting) You have me confused, you spoke of [fol. 2587] sending the train crew over, as I understand it, on some passenger train or freight train and then getting their caboose and engine over there. I was a little confused on the movement of the engine itself.

A. You usually double-head an engine and that means that the engineer and fireman are on that engine and the engine operates to all intents and purposes as though it were pulling a train along.

Q. In other words, it aids in pulling that train?

A. Yes, sir.

Q. That is what you call double-heading?

A. Yes, sir, if it so happened, however, that there was an engine at Gila with no engine crew to run it we would dead-head an engine crew over on a freight or passenger train to operate the engine.

Q. And they would be paid wages from the time they left Tucson or Yuma as the case might be?

A. That is right. Those instances are less frequent than where you double-head the engine and engine crew together.

Mr. Mason:

Q. The other confusion, I think, was the fact that you spoke of dead-heading the train crew. I take it when you referred to the train crew as distinguished from the engine [fol. 2588] crew you meant the conductor and brakeman?

A. Yes.

Q. They will move under pay but not on duty from their home terminal to the away from home terminal to undertake duty at the latter point?

A. That is right.

Q. And that is the example of dead-heading?

A. Yes.

The Court: Would it ever happen in your train movements that the engine might be moved from Tucson to the point that you indicate, Gila, without steam being up and without it aiding in pulling that train?

A. Not for the purposes we have indicated. That would be movement of a dead engine and in almost all instances it would be because the engine had something mechanically wrong with it.

Q. If you intended to use that engine at the point to which it was being taken, it would be sent over there as a live engine?

A. Under steam, yes, sir.

Mr. Mason:

Q. Mr. Sines, when an engine is double-headed in this way in order to get it to the away-from-home terminal for subsequent use in a train, is such an engine actually necessary to the operation of the train?

[fol. 2589] A. No.

Q. Is that rule again subject to some exception in some parts of the territory?

A. Yes, except in the helper territories.

The Court: There is a need for it in the helper territories?

A. Yes.

Q. In this other instance there is not a need?

A. That is right.

Mr. Mason:

Q. Will you illustrate the movement of an engine going to Lordsburg to be attached to a westbound train and which is in addition to the train engine of the eastbound train, Tucson to Lordsburg, the points at which it does necessary work, and the points at which it is an excess engine?

A. Let's say we have 70 cars with a Southern Pacific road engine accompanied by a Southern Pacific engine double-heading. Both of those engines would work at or near their full capacity between Tucson and Mescal.

The Court: Because that is an up-grade?

A. Yes. Going downhill from Mescal to Benson you would only need one engine to operate the train, although they would go down together. Going uphill from Benson to Dragoon both engines would be working at or near capacity, [fol. 2590] that would be helper territory, but from Dragoon I think into San Simon only one engine would be required. The double header would assist the road engine from San

Simon to Steins in that helper territory and it would be unnecessary again from Steins to Lordsburg although it would of course accompany the road engine.

Mr. Mason:

Q. Is helper service regularly provided in those helper districts you have mentioned, Tucson, Mescal, Benson, Dragoon, and San Simon to Steins, where single-engine trains are operated over the balance of the district?

A. Yes, for the train I have described, 70 cars of perishable on a Southern Pacific engine, a helper would be provided.

The Court: You have no helper districts across the state of Arizona so far as passenger trains are concerned, of course?

A. No.

Q. But you do have regular helper districts that you have heretofore described across the state?

A. Yes.

Q. On freight operation?

A. Yes, I would like to make one more observation with [fol. 2591] respect to providing crews at away-from-home terminals. We have spoken up to now of providing an engine and crew to bring the train back, but we might have five trains eastbound to Gila and only four returning and in order to get that fifth crew back from Gila to Yuma, to its home terminal, we would dead-head that train crew and double-head that engine if necessary. It works both ways.

Mr. Mason: Why would you bring a train and engine crew back from the away-from-home terminal after they had taken a train there if there were no returning trains in sight for them? Why not leave them there until the train came along?

A. Because after the expiration of sixteen hours they go back on pay again, whether they are in service or not.

Q. What is that type of compensation called?

A. Held-away-from-home terminal time, and every twenty-four hours thereafter they get paid eight hours whether they work or not.

Q. Did you contemplate in the redispatching study that you would have to do some such dead-heading or double-heading as the case might be?

A. Yes; I heard the dispatchers talk about H. A. H. T. almost as frequently as I heard them talk about dead-head-
[fol. 2592] ing and double-heading.

Q. Was it part of your instructions that these particular features of the service should be given full contemplation in the redispatching study?

A. Yes, that should be handled in exactly the same manner as it is handled in actual operation.

The Court: Mr. Sines, if the railroad company were permitted longer train operation, speaking of freight trains, would it increase the length of your helper districts?

A. They would not change at all.

Q. That would remain constant?

A. Yes, sir.

Q. That is governed entirely, of course, by the grade; is it not, and the weight of the train?

A. Well, by the grade and by our contracts with the organizations which specify where we may have two engines operating without penalty payments to the train crews.

Mr. Mason:

Q. Mr. Sines, as between the operations with a fixed maximum limit of 70 cars and operations without any such fixed maximum limit, which leads to the greater lack of balance, greater unbalance of power and crews?

A. The limitation of 70 cars leads to the greater unbalance of power and crews.

[fol. 2593] Q. What is it that brings about an unbalance of power and crews?

A. The lack of flexibility which the law imposes on the operations, the arbitrary fixing of the number of trains which may be operated to handle a given amount of traffic.

The Court: You said "trains"; I take it you meant "cars"?

A. I don't think so. Will you read my answer?

(The last answer of the witness was read by the reporter.)

A. (Continuing): "Trains" in this way: Suppose we had 700 cars in one direction one day to be operated out of Tucson and we are operating with a 70-car limit. If we can put 70 cars in every one of those trains, we will operate ten trains. The law then fixes the number of trains we will

have to operate, but supposing that day that we had eight trains coming eastbound into Tucson, we had eight engines and crews available to take those trains west, we could divide the 700 by eight, get an average——

The Court (Interrupting): I see your point. There is no law that fixes the number of trains; it is an indirect effect you are referring to?

A. Yes, sir.

[fol. 2594] Mr. Mason:

Q. Does the unbalance of power arise because the movement of the cars in one direction is greater than the movement in the other?

A. Yes, sir.

Q. And because as you have illustrated in your answer to the question from the Court, in Arizona the cars must be subdivided into not less than one train for each 70 cars?

A. Yes, that is right.

Q. Is it possible if a fixed limit is not imposed to balance the trains in opposing directions even though there be an unbalance of cars in opposing directions?

A. Yes.

Q. Did your redispatching study contemplate that there would be a complete balancing of train-miles and trains in opposing directions or that you would have an unbalance of power and crews?

A. The balance of power and crews was much better in the redispatching study than it was in actual operation, but it was not perfect. We still had to dead-head crews and double-head engines to and from away-from-home terminals.

Q. Did you in the redispatching study contemplate that helper locomotives would be used in the present helper districts?

[fol. 2595] A. Yes.

Q. How did you determine the number of helper engines and helper crews to be assigned for such service?

A. There again the chief dispatchers worked in exactly the same manner that they do in actual operations and increased or decreased the number of engines and crews at helper stations in accordance with the demands of the traffic.

Q. By "demands of the traffic" you mean the volume of the trains operated?

A. The number of trains to be operated.

Q. Will you say whether or not in actual practice there are certain crews and certain locomotives definitely assigned to helper service at particular points?

A. There are.

Q. Where are they assigned? What is the character of the station at which the helper crew waits? Is it the station at the top of the grade or at the foot of the grade?

A. On the Tucson division it is the station at the foot of the grade.

Q. What are those particular stations on the Tucson division?

A. Gila, Tucson, and San Simon.

[fol. 2596] Q. How far do the helper crews stationed at Gila operate?

A. They run to Estrella; I think that is something like fifteen miles.

Q. What do they do then?

A. They detach their engine from the train and return to Gila.

[fol. 2597] Q. And how far do the helper crews and locomotives stationed at Tucson operate?

A. Helper crews operate out of Tucson as far as Dragoon, a distance of approximately seventy miles. At Dragoon they detach their engine and return to Tucson. Because of the Arizona Full Crew law, we are not permitted to run light engines a distance greater than 25 miles without providing a flagman, who, in effect, escorts the engine helper crews returning from Dragoon.

Mr. Strouss: I didn't know that law was being attacked.

Mr. Mason: No, it is not being attacked. It is only an explanation of the crews that we have.

The Witness (Continuing): Helper crews returning from Dragoon were either provided with flagmen at Benson to flag the light engine in from Benson to Tucson, or else they were coupled with westbound trains at Benson or Dragoon and operated into Tucson.

Q. Is that the same method that is used in actual operation?

A. Exactly.

Q. And you followed the same method in the redispatching study?

[fol. 2598] A. Yes.

The Court: Then, do I understand that each helper crew would manage its own engine; there would not be an exchange of men on a given engine in a given territory?

A. No, the same engineer and fireman would operate that engine from Tucson to Dragoon and back to Benson, where they might be——

The Court: Relieved?

The Witness: No, joined by the flagman who would escort them into Tucson.

The Court: I see.

Mr. Mason: Now, Mr. Sines, do the helper crews at points like Gila and San Simon ever make more than one helping trip during the course of a tour of duty?

A. Yes, in those districts which are relatively short, it is not unusual that one helper crew, consisting of an engineer and fireman, will help two trains from the bottom to the top of the hill and return, all within their eight-hour tour of duty.

Mr. Strouss: Did you give the distance that the helper crew at San Simon operates?

A. That is fourteen miles from San Simon to Steins.

[fol. 2599] Mr. Mason: What happens at Steins with the helper engine?

A. The helper engine is detached and returns alone to San Simon.

The Court: Then there are only three helper districts across the state on your lines?

A. Yes.

Mr. Mason: Are there other districts where helpers are provided for in the agreement; but not used in actual service?

A. That is right.

Q. Then the districts from Gila to Estrella, Tucson to Dragoon, and Steins to San Simon, are the helper districts in which helper locomotives are actually in use?

A. Yes, sir.

Q. Are there any westbound helper districts where helper locomotives are used?

A. Not where helper locomotives are used almost invariably to the same extent that they are eastbound. There are helper districts such as Benson to Mescal where, when

these eastward helpers couple into a westbound train, the helper engine assists the train engine going up the grade.

The Court: I believe you said, Mr. Sines, in response to [fol. 2600] a question from the Court a few moments ago, that even if you are permitted to haul longer trains, if this law, in other words, were not in force and effect, it wouldn't have the effect of increasing the number of your helper districts?

A. That is right. This operation that I spoke of at Benson, as being performed actually from Benson to Mescal, we also made provision for on our redispatched trains; we didn't add any new districts.

Mr. Mason: Mr. Sines, I think the Court has in mind that the trains of 100 cars eastward or 125 westward would be substantially heavier, have more tonnage than the trains now being operated under the 70-car law. I will ask you whether the type of power that is contemplated in the redispatching study takes into account the operation of these heavier trains?

A. That is right. The road engine which we are providing would be increased in the same proportion, and the necessity for helping those trains would be no greater than the necessity for helping the trains actually operating.

Q. You spoke of westward helper districts. Have you in [fol. 2601] mind the district between Mondel and Steins, just over the New Mexico line, as an occasional helper district?

A. Yes, that is right, there is a four-mile pitch there where we can operate two engines, according to the agreement.

Q. Is there any in actual practice? Are helpers used there to any great extent?

A. No.

Q. Now, in the plan followed in the redispatching study, Mr. Sines, what particular instructions and methods were followed in determining the speed over the road of the redispatched trains?

A. That determination was made by the trick dispatchers under supervision of the chief dispatchers and relied upon a comparison which was made between trains actually operated and trains which were operated on the redispatching study. The mechanics of making that comparison were as follows: In the column on the train sheet alongside of the column in which the redispatched train was to be entered,

the trick dispatcher indicated or copied off of the conductor's delay report the progress of the train actually operated, showing the time of departure from the original terminal and the times at which the train arrived at intermediate stations, and, finally, his arrival at the final termi- [fol. 2602] nal. At the bottom of the sheet usually was indicated all of the notations which the conductor of the actual train had seen fit to make or which he made in accordance with instructions on the back of that delay report, so that the trick dispatcher was fully informed of all of the obstacles and delays which the actual train met in its operation from one terminal to the other; then, in the column for the redispatched train, the dispatcher worked that train across the railroad in accordance with the speeds made by the actual trains in accordance with the delays that the redispatched train ran into.

Q. You mean the redispatched train or the actual train?

A. Both the actual train and the redispatched train ran into in encountering the redispatched operation.

Q. I will ask you if each redispatched train was matched, so far as possible, with a train departing from the same terminal on the same day and at or near the same time?

A. Yes, that was done almost in all cases, in accordance with the designation of the actual and the redispatched train. For instance, Colton block No. 412, might have left [fol. 2603] Yuma at 6:00 A. M. some date. Our redispatched Colton block 412 probably left Yuma at six A. M., and thereafter, the running of the redispatched train was matched with the running of the actual train.

Q. Now, suppose, that Colton block 412 or the train in which Colton block 412 was carried, the actual train had run into an unforseen delay, for example, because of a grade crossing collision, would that unforseen delay have been reproduced in the running of the redispatched Colton block 412?

A. Yes.

Q. Suppose that the redispatched train, containing Colton block 412, had only seventy per cent of the engine rating of the AC locomotive handling it, whereas the actual train 412 had ninety per cent of the engine rating of the AC locomotive handling it, would you have made any difference in their speeds over the road and, if so, at what points or under what circumstances?

A. In that event, the redispatched train, I call your attention to the fact that you have provided for a difference of twenty per cent.

Q. Yes.

A. The redispatched train would have been permitted to make up a small amount of time on the ascending grades.

[fol. 2604] Q. Why would you have operated the redispatched train on the ascending grades at greater speed than the actual train?

A. Because on level and descending grades both trains would have been able to operate up to the maximum allowable speed as permitted in the timetable and according to speed boards located alongside the track.

Q. But would the same condition prevail between two trains where the ratio of load to tonnage rating is different on ascending grade?

A. No, on ascending grades, the train with the heavier percentage of engine rating would run slower than the train with a lighter percentage of engine rating.

Q. Now, what method was followed in determining relative speeds of actual and redispatched trains on ascending grades as between percentages of tonnage rating?

A. The trick dispatchers performing the redispatching computed the tonnage of the train actually run and redispatched, and where the redispatched train was within ten per cent, either ten per cent over or ten per cent under the percentage of tonnage to rating of the actual train, no variation was permitted in the running time between [fol. 2605] designated points, and by designated points I mean where there was no occasion to make any difference in the running of the dispatched train as compared with the actual train.

Q. You mean points designating the beginnings and ending of ascending grades?

A. Yes, that would be one way of choosing the points. Another way would be to say that nothing had occurred to the actual train between A and B, and nothing would occur to the redispatched train between A and B, therefore, between those two points, as long as the percentage of tonnage to the rating was within ten per cent of each other, no allowance would be made in increasing the speed of the redispatched train or showing up the speed of the redispatched train, because we ran these trains faster and,

slower both, whichever way the percentages happened to work out.

Q. Now, where you found a difference in the ratio of tonnage to rating as between a redispatched train and to the actual train with which it was matched, did you make a difference in time on the ascending grades, that is apart from unforseen occurrences, or anything else, which might interfere with the progress of the train?

A. Yes. In all of the districts except that between Lordsburg and El Paso, where the difference exceeded ten per cent, we permitted trains to make up or lose as much as fifteen minutes in any train district. In the Lordsburg-El Paso district, the maximum to be made up or lost was somewhat greater than that, because of the physical characteristics of that district. Even there the chief dispatcher was working under a maximum which I do not at the moment recall.

[fol. 2606]

Q. That will be developed in the testimony of that dispatcher?

A. Yes.

The Court: We will take our mid-afternoon recess at this time.

(Thereupon, a short recess was taken, after which the witness was recalled to the stand, and proceedings were resumed as follows:)

The Court: You may proceed.

Mr. Mason: Mr. Sines, in your testimony prior to the recess you spoke of the occasions when a train crew, consisting of the conductor and brakemen, have to be deadheaded either to or away from a home terminal, that the caboose also had to be handled to or from that point?

A. That is right.

Q. How is such a caboose ordinarily handled?

[fol. 2607]

A. That is handled on a freight train.

Q. If handled on a freight train, is the deadhead caboose simply counted as a caboose or part of the 70-car consist permitted by the law?

A. Counted as one of the seventy cars permitted by the Arizona law.

Q. Does it displace a loaded car in that event?

A. It displaces a loaded car if occasion arises.

The Court: Does the conductor ride that caboose?

A. Not necessarily. The train crew is usually given the choice of riding a passenger train if a passenger train is available, or the caboose. If a passenger train isn't available, of course, the conductor and brakemen will ride the caboose; on the other hand, they generally ride the passenger train if the passenger train will get them over to the terminal in time to catch the run that they are called for.

Mr. Mason: Now, in the operation of the redispatched trains, Mr. Sines, was any provision made for stops for inspection enroute between terminals?

A. Yes, provision was made for inspection stops in [fol. 2608] exactly the same manner that inspection stops were made during the actual operation of the trains.

Q. Suppose that the redispatched train consisted of 95 cars, whereas the actual train with which it was matched consisted of less than 70 cars, would you allow the same time or more time for the inspection stop?

A. No, when the redispatched train exceeded 90 cars in length the inspection stop was increased from five to ten minutes in length.

Q. When you speak of these inspection stops, what character of inspections do you refer to?

A. Those are stops which are made by the trains for the purpose of permitting the train crew, that is, the conductor and brakemen, to walk around the train inspecting the wheels, running gear, brakes, in fact, the entire equipment, to make sure that it is in running condition.

Q. That is the so-called train crew inspection, is it?

A. Yes.

Q. Are there other inspections made of cars and trains as they pass along the division?

A. Yes, all employees of the railroad who have occasion to work along the right-of-way or in stations, are instructed [fol. 2609] and they do watch the trains as they run by them. I am speaking particularly of the section forces. I used to work in the maintenance department and I have also observed station employees making the same kind of running inspection of trains as they go by them.

Q. Are there inspections made at terminals as trains stop or prior to their departure?

A. At terminals such as Gila and Lordsburg, a running inspection is given the departing trains by the train crews of those trains. At terminals such as Yuma, Tucson, and El Paso, inspections are made by car department inspection forces prior to the departure of the trains.

Q. Are those repairmen in the car repair department?

A. They are in the mechanical department and they are often referred to as car knockers. I think they are car repairmen.

Q. You have seen them making those inspections, have you, frequently?

A. Yes.

Q. Are similar inspections made at Douglas, if you recall, by car forces?

A. No, I don't know whether it is the train crew or car inspectors who take care of the trains in Douglas.

[fol. 2610] Q. In the redispatching study, did you contemplate any different character of inspections of the trains than those which were made of trains actually operated?

A. No, we contemplated that the redispatched trains would receive full and complete inspections the same as those accorded actual trains.

Q. And that the necessary time would be allowed for that purpose?

A. Yes.

Q. Now, in the operation of the redispatched trains, was any provision made for the meeting of opposing traffic, opposing trains?

A. Yes, redispatched trains took siding to meet redispatched trains and to meet other redispatched trains or to permit other redispatched trains to pass them also.

Q. How did you make allowances for time consumed in taking sidings or waiting for meets and passes, did you use any different method than is followed in actual practice?

A. No, the train dispatchers in handling the operation of trains from their dispatching office and in putting out orders, must estimate the length of time that will be re-

[fol. 2611] quired by trains to go into sidings, to make these meets and get out again and proceed on their way. The train dispatchers handling the redispatching study had to perform the same mental calculations as when they were actually working a trick.

Q. And did they do so in redispatching the trains?

A. They did.

Q. What did the redispatching study contemplate as to the time of the redispatched trains through the intermediate terminals between Yuma and El Paso?

A. Time at intermediate terminals was determined from the amount of work or the operations which the redispatched trains had to perform in the intermediate terminals and was based upon the train dispatcher's and the chief dispatcher's knowledge of operating conditions.

The Court: You frequently used the term "trick dispatcher": what did you mean by that?

A. In describing the party that performed this redispatching study with me, I mentioned two trick dispatchers who assisted the chief dispatchers. A chief dispatcher of a division concerns himself primarily with the calling of trains and ordering of engines and crews and getting [fol. 2612] the trains started from initial terminals. He indicates to the trick dispatchers, working under him, when he wants these trains to start, and thereafter it is the responsibility of the trick dispatchers to issue the necessary orders to get those trains started on the road, and to progress them across the division, meeting and passing other trains. The trick dispatchers then issue orders and make a running record of the progress of those trains as they go across a division, and as the trains are reported back to them on the telephone or by telegraph from the wayside stations.

Q. Is the trick dispatcher the man who sits at the telephone or telegraph key and actually records the movement of the trains and gives directions for their further movements?

A. Yes, and in our redispatching study, our chief dispatchers were concerned mostly with the consisting of the trains, the number of cars in the trains, the engines that were provided for those trains, and the time of departure from the initial terminal, then the trick dispatchers worked those trains across a division on our redispatch train sheets.

Q. Did the trick dispatchers work closely with the chief dispatcher in carrying out this operation of the redis- [fol. 2613] patched trains on the redispatch train sheets?

A. Oh, yes, that work was done under the direction and supervision of the chief dispatchers.

Q. And in their immediate presence?

A. Yes, we were all in one large office there in San Francisco when this job was being done.

Q. Was it all done under your immediate supervision, in accordance with the plan you have been outlining here?

A. That is right.

Q. Mr. Sines, do you know and, if so, will you state whether there is a difference as between engineers, individual engineers or individual conductors in the speed with which they will handle their trains and the facility with which they will perform their duties along the road?

A. That is right, there is a difference, depending upon the skill, training and experience of the engineers in the way in which they will handle the engines, and that is reflected in the speed of the trains and the ability of the trains and engines to get over the road. Then the work that is done at the local stations depends upon the conductor and brakeman who are going to do that work on the ground. Some crews will take longer to perform certain operations [fol. 2614] at stations than other crews.

Q. In the redispatching study, were you able to take into account any of these individual differences? If so, how was that accomplished?

A. Those individual differences were taken account of, but it was automatic, because as the redispatched train was matched with the actual train, the redispatched train's progress depended upon the actual train's progress. If it happened that the actual train had a skillful engineer, then the redispatched train would have a skillful engineer, or if the actual train had a less experienced train crew, our redispatched train would also be delayed in its station work to the same extent.

[fol. 2615] Mr. Mason: Mr. Sines, you said previously that the result of the redispatching study was to operate fewer trains than were actually operated?

A. Yes.

Q. Was that due to the redistribution of the same traffic into longer trains?

A. That is right.

Q. Did that result in the elimination of any of the actual trains?

A. Yes.

Q. Suppose that an actual train had suffered a delay enroute because of having to flag a block; but in the redis-

patching study that actual train was eliminated. What did you do with the delay suffered by that train; did you forget about it?

A. No, that delay would then be assessed against a train of the same class operating at or about the same time. No delays of that character were eliminated by the redispatching study.

Q. Did any of the actual trains suffer delay because of a broken knuckle, do you recall any such instances?

A. I don't know whether we had any broken knuckles or not.

Q. Suppose one of your actual trains did suffer delay because of a broken knuckle, would that delay be assigned [fol. 2616] to a redispatched train and, if so, in what manner?

A. That would have been assigned to the redispatched train handling the equipment that the actual train handled.

Q. If it was C-413 that had a broken knuckle, which redispatched train would be assigned that?

A. C-413 would be assessed the delay.

Q. Did you for the purpose of the redispatching study contemplate having any additional train order offices over and above those which were open and available during June and August, 1938?

A. No.

Q. Did you contemplate having any fewer such train order offices?

A. No.

Q. I think you have stated that the redispatching train sheets were prepared for each day covered by the 1938 redispatching study?

A. That is right.

Q. Did you prepare a form of work sheet from the actual and redispatching train sheets?

A. We did.

Q. Have you a sample of the work sheets so prepared governing one particular district or day?

A. I have.

[fol. 2617] Q. Will you state what the title of this sheet is?

A. The title of this sheet is "Sample Copy of Work Sheet A (Page 167 of 1938 Redispatching Study)."

Mr. Mason: May we have this sheet marked for identification as "Defendant's Exhibit No. 198"?

The Court: It may be marked.

The Clerk: Defendant's exhibit No. 198 for identification.

Mr. Mason:

Q. Mr. Sines, is this defendant's exhibit No. 198 a sample of the work sheets used in the carrying on of the redispatching study?

A. Yes, this is an intermediate compilation sheet which stood in between the train sheets and the other sheets upon which our final answers appear and was used for consolidating the information both as to actual operation and redispatch operation.

Q. This is shown as page 167. How many work sheets of the same type as this were used for the purpose of the 1938 redispatching study or were compiled in that connection?

A. We used 848 work sheets A for the June and August freight redispatching study and we used 94 sheets for our 1938 passenger redispatching study.

Q. Is exhibit No. 198 for identification typical of the [fol. 2618] 848 work sheets used in the freight redispatching study of 1938?

A. It is.

Q. From what sources was this work sheet actually prepared?

A. The information in the top half of the sheet headed "Actual" and down as far as the word "Total" is abstracted from the actual train sheets for the territory Tucson to Lordsburg for this particular sheet No. 167.

Q. And the balance of the information?

A. Was taken from the redispatch train sheets for the same territory.

Q. Does that include all the information on this sheet or only that information up to and including column 15?

A. That only includes information up to and including column 15 and for the actual train sheets the names of conductors and engineers were abstracted and placed in column 28.

Q. Does the information in column 28 also include the names of flagmen, if any are used?

A. Yes, the flagmen that I have described as operating between Tucson and Benson.

Q. Who placed the information shown in columns 0 to 15, inclusive, on work sheet A?

[fol. 2619] A. The trick dispatchers who were assisting the chief dispatcher in the redispatching study.

Q. Was this done under your immediate supervision?

A. Yes, we all took turns at entering and checking this information but the bulk of it was done as I have described by the trick dispatchers.

Q. Going to columns 16 to 27, inclusive, how was that information placed on the sheet?

A. That information was furnished by the timekeeper, Mr. H. C. Garverick, whom I have mentioned before, who secured that particular data from the conductors' time returns and delay reports.

Q. Then the information shown in columns 16 to 27, inclusive, are the wages claimed or payable to the crews as shown on the time returns and delay reports?

A. The wages actually paid.

Q. You show here in column 16, basic train engine, and then show in column 17, variable amounts. What is the significance of those two terms?

A. For purposes of the redispatching study we had to analyze the wages of every one of those crews to make a separation between the basic amounts covering the payment of the crews because of their operation from the [fol. 2620] initial to the final terminal, which does not vary with the length of time or the service that is performed in either the initial or the final terminal. The variable amounts covered such items as overtime, if there was any, and service performed in the initial and final terminal which does not depend upon the operation of the train from the initial to the final terminal.

Q. Such payment as might be made, for example, for initial switching or terminal switching?

A. Yes.

Q. Would the variable amounts include any payment made because of local switching enroute?

A. Well, that would be reflected in the basic train wage in column 16 when the character of the service changes from through to local.

Q. Suppose that any of these crews became entitled to "held away from home terminal pay." Where would that appear?

A. That would appear in the variable column 17 for engineman and in column 24 for trainmen.

Q. Will you refer, please, to column 19 and explain what you mean by "helper engine attached and light" as applying to the wages shown there?

A. The first amount shown opposite Kennedy's name is for the movement of a helper engine 439 miles, indicated [fol. 2621] in column 8, the engine having been engine 3322. One hundred thirty-nine miles is the distance from Tucson to Dragoon and return and the amount shown in column 19 is the entire payment for that engine crew by reason of its service attached to a train going from Tucson to Dragoon and light returning from Dragoon back to Tucson. The next amount shown opposite Bagley's name indicates that it was paid for a trip of 30 miles by engine 3313. Thirty miles is the round trip distance for a helper engine crew from San Simon to Steins and return to San Simon. Occasionally, well, it is not so occasionally either, it is quite frequently, helper engines would be coupled with westbound trains at Benson to return to Tucson and in that event the operation of the eastbound train would be charged with the movement of the helper engine from Tucson to Dragoon and return to Benson and the balance of the payment to the engine crew would be charged against the operation of the westbound train from Benson into Tucson. That was the case with the third item in column 19, which is shown one line below, engine 3202, engineer Wheeler.

Q. What is the significance of the initials in parenthesis following Mr. Wheeler's name there?

[fol. 2622] A. Those are the telegraph call letters for stations which are printed on the train sheets and which chief dispatchers and trick dispatchers use as kind of a shorthand in indicating the names of the stations.

Q. Does UN mean a particular station?

A. UN means Tucson; DR means Dragoon; and B means Benson; meaning that engine 3202 negotiated 91 miles with engineer Wheeler from Tucson to Dragoon and return to Benson and they were paid the amount shown in column 19 therefor.

Q. What about the information shown in columns 0 to 15, inclusive, of the redispatched portion of exhibit No. 198 for identification, from what source was that taken?

A. That information was abstracted from the redispatched train sheets.

Q. You show, for example, under the heading (4), "Train Engine Number," 4100. What does that signify?

A. That signifies that an engine of the 4100 class, AC-8 was used to operate on the redispatched train.

Q. You show in column 7, "Helper Engine No." a single number 5000. What does that mean?

A. That an engine of the 5000 class, that is S. P. 4, 2, [fol. 2623] or 3, was used as a helper to help the redispatched train between the stations indicated, the first one, Tucson, Dragoon, and back to Benson.

Q. You show in that same column for two redispatched trains the word "single." What does that mean?

A. These particular trains operated the entire trip from Tucson to Lordsburg without the assistance of helpers either out of Tucson or San Simon.

Q. When you get over to the wage columns, 16 to 27, inclusive, there is certain information on the sheet. Where was that taken from?

A. Those are the basic wages which I have previously described which can be determined in accordance with the contracts with the employees applying against these particular train and engine movements.

Q. These redispatched movements?

A. Redispatched movements and were placed there by our timekeeper, Mr. Garverick.

Q. Why is the amount shown for the movement, for example, the first item under "redispatch" you show the basic train engine wages as a certain figure. Why is that amount larger than the basic train engine wages for the first movement of the actual train?

[fol. 2624] A. Because the enginemen are paid in accordance with the weight on drivers on the locomotives.

Q. Is the 4100 class locomotive heavier on drivers than the 5000 class?

A. Yes.

Q. As shown on Mr. Russell's exhibit No. 5?

A. Yes, sir.

Q. You show no variable amounts for wages of enginemen or trainmen for the redispatched trains. What is the explanation?

A. They were handled in another manner in a lump sum calculation which will appear on a subsequent exhibit.

Q. Do you have the other 942 sheets which relate to the 1938 freight and passenger redispatch study?

A. Yes, we have them in our office across the street.

Q. Will they be available for the study of opposing counsel?

A. They will.

Q. Will the redispatch and actual train sheets which you have mentioned as a source of white work sheets, such as exhibit No. 198 for identification, also be available for the study of opposing counsel if they desire?

[fol. 2625] A. Yes, sir.

Q. Do you also have the time returns and delay reports which were used in making up these white work sheets?

A. Yes.

Q. Are they likewise available?

A. Yes, all of the basic documents covering the actual operations as well as the work sheets in connection with our redispatch operations we intend to make available to opposing counsel.

Q. I don't know if I have mentioned it, but I suppose that you have the original train sheets, the dispatchers' train sheets?

A. Yes, they are here in Tucson also.

Q. I take it that the purpose of this exhibit is to indicate the methods employed in one of the steps in developing the redispatching study rather than to portray the information as to this particular day and district?

A. That is right, this is merely to demonstrate the mechanics of making this redispatching study and to indicate my part in it and also the part of the other members of the party of course.

Mr. Mason: Do you have any questions, Mr. Strouss?

Mr. Strouss: This doesn't show any place on it, does it, [fol. 2626] the tonnage which was included in any train?

A. No.

Q. That would be a rather important thing to know in knowing how your train was to be handled, wouldn't it?

A. That is right. That information is shown on the original train sheet and on the redispatch train sheet and is one detail that I haven't discussed here completely although it seems to me I did mention it. The first thing that the trick dispatcher did after he was notified by the chief dispatcher of the consist of the redispatched trains was to compute the tonnage of the redispatched trains and the actual trains and to enter it on those redispatch train sheets at the head of those columns in order that he might

determine what the per cent relationship was, both of the actual train and the redispatched train, of tonnage to engine rating. It could have been put on here, but it would have been so much extra work and wouldn't have served any particular service in further compilation. That item, however, was one of the very important considerations in connection with this redispatching study.

Mr. Mason:

Q. Do I understand that the tonnage handled in the [fol. 2627] various trains was not a necessary item in the particular step undertaken by the work sheets, of which this is one of the steps?

A. That is right. At the time the white work sheet was drawn off we had progressed beyond the tonnage stage. From that point on we were making a record of the movement and were trying to get train-miles, locomotive-miles, and money.

Mr. Strouss: You are a little ahead of time on this exhibit then.

A. I don't follow you there.

Mr. Strouss: It has to assume that the train sheets of the assumed operation are correct, that the tonnage which is not shown here could be handled in the way you have indicated on here.

A. I don't know that I will agree with you in your choice of the word "assumed." I have spent a couple of hours here describing the mechanics of this redispatching study. There isn't very much assumption about it. The chief dispatchers and the trick dispatchers knew what they were doing every minute.

Mr. Mason: I think what Mr. Strouss means is this, that the white work sheet was drawn off after the operation had been completed.

A. I will agree with that.

[fol. 2628] Mr. Mason: And was a step after the operation had been completed, isn't that what you had in mind, Mr. Strouss?

Mr. Strouss: Yes, but in order to show the data that you do here you do assume that the redispatched tonnage could be handled as shown on the redispatched train sheets without showing the tonnage here.

A. Subject to my qualification of the word "assumed" I will agree with you.

Mr. Mason:

Q. This represents that the tonnage has actually been handled in these redispatch trains, does it not?

A. As far as I am concerned it has, yes.

The Court: Putting it another way, in the upper block there, which I understand represents the actual train movements, you have there, I don't know just how many more but a few more trains than what you show on your redispatch movements below?

A. That is right.

The Court: But all of the traffic, if I may use that broad term, reflected in the upper block has been moved in this theoretical movement of your redispatch in the lower block?

A. That, generally, is a true statement, yes, sir.

[fol. 2629] Mr. Strouss: What do you mean by "generally"?

A. Because if you look at the tables in column 12 you will find that the total loaded cars was 546 actual and 584 redispatch. From one end of the month to the other end of the month we had moved the same volume of business but within any twenty-four hours we would not necessarily move the same volume.

Mr. Mason: Does that mean that some business which was moved actually in the twenty-four hours, midnight to midnight, June 18, may have been moved slightly before midnight of June 17-18 and redispatched?

A. Yes.

Q. Or the opposite; it may have moved after midnight on June 19, for example?

A. That is the idea.

Mr. Strouss: I noticed a little while ago you testified concerning numbers as identifying classes of engines used on the redispatch. Did you identify all the different classes of locomotives used?

A. On our redispatch train sheets?

Mr. Strouss: Yes.

A. Yes, sir.

Mr. Strouss: You did?

A. Yes.

[fol. 2630] Mr. Mason: What did you have in mind, Mr. Strouss? I think he identified the 4100's as the train engine class which was contemplated by the redispatched plan.

Mr. Strouss: I didn't understand at the time he was giving them all. I thought he was giving typical examples; I didn't take them down but I can get them from the transcript. These numbers would mean something to me.

Mr. Mason: I think I can develop that a little bit but in order that the record may be clear, Mr. Sines, what type of locomotive was contemplated to be used as to train locomotive on your redispatch trains between Yuma and El Paso?

A. AC-8.

Q. What does the number 4100 indicate?

A. AC-8 locomotives.

Q. You didn't assume any particular AC-8 locomotives; did you?

A. No.

Q. But just that you would have a group of AC-8 locomotives otherwise called "4100" class locomotives?

A. Yes.

Q. Your previous testimony did not mention it but you show here the use of 5000 class locomotives as helpers?

[fol. 2631] A. Yes.

Q. Was that a part of the redispatching plan that the S. P. type or 5000 class locomotive would be used in helper service?

A. Yes.

Mr. Mason: Does that make it clear to you now, Mr. Strouss?

Mr. Strouss: Yes. Are the tonnage ratings of those locomotives shown on your timetables for this division?

A. All except the AC-8, that is not shown on the tonnage rating tables of the Tucson or Rio Grande divisions for these districts. Generally, however, the tonnage rating of the AC-8 is 165 per cent of the rating of an F-4 locomotive, within two or three per cent one way or the other.

Mr. Strouss: Of an F-4?

A. Of an F-4. I can give you that rating over the ruling grades either now or later on.

[fol. 2632] Mr. Mason: I was going to develop that anyway, but I think we have an exhibit which is pending here.

not introduced, and if you have no more questions on the exhibit, Mr. Strouss——

Mr. Strouss: No.

Mr. Mason: Has your Honor any questions?

The Court: No.

Mr. Mason: We offer the exhibit in evidence as Defendant's No. 198.

Mr. Strouss: I object to it as irrelevant and immaterial, calling for the opinion and conclusion of the witness, and speculative.

The Court: I will hear you, Mr. Mason, on that objection. The court doesn't know, of course, just how far you intend to pursue this line. Up to date we have dealt with actualities; now we are getting over into the realm, as I take it, of what the Southern Pacific would have done had they not been confronted with the Arizona law, how they would have handled this traffic, which is purely theoretical.

Mr. Mason: Not entirely theoretical; it is no more theoretical, your Honor, than, for example, would be the plans of an architect who had built a building, who had drawn the plans and had a building constructed, let us say, eight [fol. 2633] stories high, if he were suddenly confronted, with an ordinance that the building must not be more than six stories high, that it must have the same floor space and accommodate the same number of tenants as previously accommodated. Now, in order to resist that ordinance, if you like, it might be necessary to show how the building would have to be constructed and cut down in order to meet the terms of the ordinance, and what the cost would be, and how the operation, if it were undertaken, could be undertaken. Here we have the architects, or their counterparts in the chief dispatchers and trick dispatchers who actually ran the trains subject to the 70-car limit, and its extra-territorial effect over the district covered by the redispatching study. We have the same men undertaking to run the same traffic over the same territory, in the same period, and under the same conditions, except as those conditions would be changed by the elimination of the 70-car restriction. Perhaps my illustration of the imposition of a new restriction is the reverse of what we have here. Here we have produced an architect who has previously been faced with a six-story limit and who is now called upon to prepare the plans for an eight-story building because the [fol. 2634] restriction has been lifted and who wants to

show that it is practicable to build an eight-story building. He therefore prepares the plans and shows what those plans would be. We have nothing different here.

I want to call to your Honor's attention that in the first Arizona train limit case, as a reference to the opinion will show, a redispatching study was presented. It was presented by Mr. Andrus. I am not referring to the Santa Fe redispatching study presented by a gentleman from that railroad. Mr. Andrus of our railroad presented a redispatching study as applied to certain traffic in 1927, I think it was. The evidence was received in 1930—Mr. Strouss may correct me if my memory is a little hazy—Mr. Andrus presented such a study, and it formed the foundation for many of the conclusions and findings of the court and it is mentioned in the opinion. When we came to the Nevada train-limit case, we were, of course, faced there with the imposition of a new restriction upon operations hitherto unrestricted. We then presented—and your Honor has been furnished with a copy of the findings—a redispatching study, and the findings of the court which relate directly to that redispatching study and the results of the redis- [fol. 2635] patching study, as indicating the burden upon the commerce handled across Nevada and the delays imposed upon that commerce, and the added expense which the law would impose, are all predicated upon the redispatching study which was introduced in the Nevada case; introduced, I may say, by Mr. Sines and the train dispatchers who worked with him and developed them. I had intended to develop by Mr. Sines that the redispatching studies here were developed largely as they were in the Nevada case. The use of redispatching studies in a train-limit case of this kind is certainly proper, if the opinion of the courts which have considered the matter is to be taken as any guide, and particularly if their reliance upon the redispatching studies is to be taken as any guide. I would like to refer your Honor particularly to finding No. 17 in the Nevada Case which appears on Page 30 of the print, and which reads as follows: If I may impose upon you by quoting it. It is headed "17. Effect of the Train Limit Law upon Plaintiff's Operations. The Redispatching Study.

"To determine the effect of the Train Limit Law upon its operations, plaintiff conducted a study of the trains and traffic handled over its Nevada lines during the months [fol. 2636] of February and October, 1934." I interpolate

to say that this case was heard commencing in 1935, and that the evidence with respect to the redispatching study was introduced during September and October of that year. Continuing the quotation: "The two months selected were typical and representative of the year 1934. February was the month of the lightest traffic volume and October the month of heaviest traffic volume. The volume of the traffic handled in the two months taken together constituted slightly less than one-sixth (15.709 per cent) of the total for the entire year. The study of railroad operations thus made is referred to herein as 'The Redispatching Study'," those three words being in quotations. "This study involved a detailed analysis of each of the freight trains actually operated by plaintiff over Nevada lines as to consists, speed, and other essential features of its operation; and the complete rearrangement, into "redispatched" trains, of the cars and traffic actually moved, so as to conform the plaintiff's operations for the purpose of the study, to the conditions which would be created and compelled, if the law were enforced.

[fol. 2637] "In making said study it was assumed that all the conditions which actually prevailed upon said lines during the two months mentioned would have continued to prevail, except to the extent that the limitations imposed by the law would have required modifications of plaintiff's operating methods, and certain changes in the types of locomotives used. The redispatching study was carefully conducted under the direct supervision of experienced and qualified operating and executive officers of the plaintiff, by chief train dispatchers who now and for many years past, have supervised the operation and movement of plaintiff's trains on the Nevada lines. The result of this study presents as accurate a determination as possible of the effects of the law, in the following particulars: (1) in requiring additional train service to be operated by plaintiff on the Nevada lines; (2) in creating or aggravating delays to and interference with plaintiff's trains and cars and the traffic transported thereon; and (3) in imposing additional expense upon plaintiff's operations."

That is substantially all of the finding in Paragraph No. 17. There are additional findings which go into the detail [fol. 2638] as shown by the redispatching study, referring to the additional train mileage made, the extra-territorial effect of the law as shown by the redispatching study, de-

lays at intermediate points, delays enroute, operation of additional trains, and reduction of train lengths, and financial burdens, all of which of course were dependent upon and directly related to the redispatching study and shows the result of it. Now, in the present case, we simply have the counterpart of the Nevada situation. In place of reconsisting or recasting the operations, so as to meet the conditions as affected by the limitation of the law, we recast them so as to meet the conditions which would prevail if the limitations of the law were removed; and, just as changes in the locomotives would be required for the short train operation in Nevada, so changes in the locomotives would be required for the longer trains operated in Arizona, and that change is part and parcel, as Mr. Sines stated in his testimony, of the redispatching operation. But in essence this redispatching study is just like the one in Nevada, carefully conducted and, paraphrasing from the language of the Court, "under the direct supervision of experienced and qualified operating and executive officers of the plaintiff, by chief train dispatchers who now [fol. 2639] and for many years past, have supervised the operation and movement of plaintiff's trains on the Arizona lines as affected by the Arizona Train Limit Law. It seems to us that by no other method could *be* as accurate a determination of the effect of the law, as alleged in paragraph 3 of our affirmative answer, be determined. Even if you were to operate trains in defiance of the law and risk the penalties, you would not get a complete answer because you would have to redispatch the long trains that you had operated into shorter trains in order to determine just how much you had saved by your long train operation. Furthermore, a long train operation in defiance of the law, let us say for a test month, would require the transfer of locomotives, would require the lengthening of sidings, would require therefore a very heavy investment. We can achieve the same result by comparing redispatched operation with the use of these new locomotives and with the use of long sidings, and compare it with what actually transpired, and obtain the results just as accurately as though we had violated the law and operated such trains. I will say, by reference to the exhibit received, No. 196, that we have a redispatching study based upon a period in April, [fol. 2640] 1940, when trains were operated without regard to the law, but at that time we didn't have long sidings,

which are part and parcel of the 1938 redispatching study; and we didn't have the AC power. We didn't use the AC power, we used the same locomotives for those long trains during April, 1940, that we used before and have used since for the shorter trains, but we have in this 1940 redispatching study a showing of the saving effected by that period.

The Court: Do I understand that during the month of April, the Southern Pacific Company operated their trains as though the law was not on the books?

Mr. Mason: For a period of twenty-seven days we operated approximately 300 trains, which did not comply with the provisions of the Arizona Law.

The Court: Both freight and passenger?

Mr. Mason: No, the passenger train operation was for a period of nearly two months; the freight train operation began on April 4th, I believe, and ended, I believe, on April 30th.

The Court: Then, does this study involve actual operations? What I am driving at is this, this statement as to the freight traffic, you say you did actually operate for a month or more?

[fol. 2641] Mr. Mason: Yes, 27 days freight train operation.

The Court: As though the law were not on the books?

Mr. Mason: Not entirely as though the law were not on the books. If the law were not on the books, of course, we would have undertaken siding extensions and transfer of power; we didn't do that.

The Court: You didn't transfer your heavier locomotives here?

Mr. Mason: No.

The Court: And made no improvement in your sidings?

Mr. Mason: No.

The Court: And no improvements in the roundhouses?

Mr. Mason: No. We have a redispatching study separate and apart from the one that Mr. Sines has been testifying to so far, which takes the trains as operated in 1940, and then redispatches those trains to the shorter length which would have been operated if the law had been fully observed; and then we have a redispatching study which takes those trains as operated and redispatches that traffic into trains which would have been operated if longer sid-

[fol. 2642] ings and heavier locomotives had been available.

The Court: Go ahead, Mr. Strouss.

Mr. Strouss: I have a long distance call that came about a half an hour ago.

(Thereupon, Mr. Strouss left the court room, and proceedings were suspended until his return.)

The Court: Well, Mr. Mason, before you continue with your presentation of this matter, maybe if the court asked two or three questions I might indicate what is in my mind. Of course, you will keep in mind, gentlemen, that while you have been through the mill before, this type of case, this is a case of first impression with the Court. I wish you would indicate just briefly and generally just the scope that you intend to cover with this. I am also concerned with whether you propose to put on the witness stand here the dispatchers and others who participated in this conference, in this study which took weeks and months. Now, Mr. Sines here has very frankly stated as he has testified, he would very frequently say, well, we did that and we decided that, and so on. Now, this study here, is it his conclusion or is it the conclusion of the group who conducted the redispatching study?

[fol. 2643] Mr. Mason: I think we are perhaps getting a little ahead of our story in discussing the admissibility of the redispatching studies at this time. Now, to answer your question, we do intend to call the chief train dispatchers. We intend to call four chief train dispatchers who participated in this study, particularly the chief dispatchers who successively occupied that position on the Tucson and the Rio Grande divisions. We have only had the subject presented by Mr. Sines initially, because he was the man in charge. Perhaps I should have identified him as the man in charge of the Nevada studies as well, so as to qualify him as a man of experience. We intend to call the chief dispatchers. Now, going to this exhibit, this exhibit after all is part and parcel of the description of the method which has been given here orally in very large part and, as your Honor will recall, without any running objection or any objection at all; and the objection occurs only when the exhibit is offered, although its purpose was stated to be illustrative of method, rather than an attempt to show actual results, particularly for the 18th day of June, 1938, on this particular district.

The Court: Then it is merely an illustration.

[fol. 2644] Mr. Mason: This is a short cut. By verbal testimony it could be done in the same way, but it would take an enormously long time to put this in by question and answer when it can be so quickly done by an exhibit. So as to this exhibit, when we argue the admissibility of the redispatching study, we are getting a little ahead of the story. The argument should come after the chief dispatchers and the timekeeper have testified.

The Court: Mr. Strouss, you have made this objection. The Court will hear you if you care to be heard.

Mr. Strouss: I want to deny that the oral testimony that has gone in is without objection. With what is contained in here, all that has been testified to so far are the headings of the different subject matters of the exhibit.

Mr. Mason: I didn't mean that. I meant as to the methods followed in the redispatching study. Up to the point where we struck Exhibit 198, Mr. Sines had testified at considerable length in that regard, and, as I understand, without objection. This is nothing but an exemplification of methods followed.

The Court: The contents of this particular exhibit in all this is relatively unimportant, it is a matter of the [fol. 2645] system used to illustrate the manner in which this redispatching study was conducted.

Mr. Strouss: At the same time, it puts in evidence for this 12-hour period their redispatching of the trains. Now, while it may be put in only for the purpose of illustrating the method of doing the work, it has more than that in it. It is what Mr. Sines testified that the actual train sheet for that 12-hour period contained, and what they did in the redispatching for that period.

The Court: Well, Mr. Strouss, even though it may be premature, it is evident that the Court is going to be confronted with this testimony and is going to have to rule on the matter. What is your view and attitude toward a redispatching study?

Mr. Strouss: I am coming to that.

The Court: All right.

Mr. Strouss: There are one or two other things I want to say ahead of that. The Arizona case of ten years ago is referred to again, and I again want to say to the Court that it is beyond me to see any rule of evidence in that

case. Now, the master in that case stated—and if counsel doesn't agree with me, I will be glad to bring the tran-
[fol. 2646] scripts here. I have them in my room, to read a statement of the master at the very beginning that whenever an objection was made that he was not going to rule on any objection, he would admit all evidence and have the matter later determined by the Court. Now, it never was determined by the Court. There was an ex-parte hearing in San Francisco, which the Company's attorneys attended, and the attorneys for the State did not attend, and which the Supreme Court later said was not a hearing later. Certainly, that opinion cannot be cited as any rule of law. Now, in the Nevada case, so far as I have been able to determine from this opinion and reading the record, the objections I have made here were not made in that case; certainly, there is no ruling upon it in this opinion, findings of fact, or conclusions of the Court. Now, this exhibit, as Mr. Sines has testified, the dispatchers after a conference decided upon this redispatching of trains. In the other case it was called the "assumed operation," and I beg your pardon for using that here.

The Court: I would say it was at least a reshuffling.

Mr. Strouss: But the actual operation of these trains, the dispatcher as the traffic comes up has to move the
[fol. 2647] traffic along, and these trains were operated in a twelve-hour period as shown, and over the two months, twenty-four hours each day for the two months' period. Then we have a gathering here in conferences which lasts from May to September to work out what they figured they would have done had the law not been in effect. Now that to me is purely speculative, purely opinion testimony by employees and officers of the defendant company here testifying as to a situation which did not exist as to what their opinion would have been if it had existed. That, I think, is not competent evidence.

Mr. Mason: Well, your Honor, I can only say as to the Arizona decision, that though the Supreme Court may have said that the decision was a mistake, nevertheless, the opinion has been published, and referred to with approval by at least one other three-judge court. Certainly, there is no fault to be found in the finality of the Nevada Train Limit Law case. Opposing counsel perhaps has the record in the Nevada case. Somewhat the same objection was

there made by the defendant attorney general, and what I have heard today is a faithful echo of that objection. There is nothing speculative, of course, about the redispatching of trains by experienced train dispatchers. In [fol. 2648] fact, they have to figure in advance what they are going to do with trains before they operate, otherwise the trains would get out on blind sidings and try to get around each other. They have to plan about the traffic before a train ever moves.

The Court: That is what happened at Dragoon the other night when I went home, it was held up about twenty minutes.

Mr. Mason: And it sometimes happens when a dispatcher overlooks his hand. He has to plan his work before the train ever moves and to speculate, if that is the proper word; anyway, he figures on what he is going to do. With a known condition confronting him, and with conditions as they existed tabulated for the purpose of his studies, there is no more speculation about the redispatching of the trains than there was about the dispatching of those trains in the first instance, perhaps somewhat less. In the redispatching he know- what difficulties he is going to encounter, while in the original dispatching he has to somewhat guess at that. It is opinion testimony based upon studies made by experts, by the men best qualified by experience by actual handling to express that opinion.

The Court: Mr. Mason, the thing that seems a little odd [fol. 2649] to the Court, I confess I don't see how you could avoid it in this type of study, but here is a group of men, of experts, who spend months making a certain study, each of them a specialist in his own field. Now, you call Mr. Sines as your first witness. Of course, you can't do this all at once, I recognize that; then he proceeds to give to the Court not only his opinion but the combined opinion of the experts there assembled.

Mr. Mason: Your Honor, he hasn't testified that is, not except perhaps as incidental, and then certainly not with the idea that it should intentionally appear; it is simply as to the methods which he and the members of the party undertook to use.

The Court: I think he is surely qualified as to the results, he got down to that more than once this afternoon, that he could handle that traffic with fewer trains and less expense.

Mr. Mason: I don't think he has testified as to expense. We will show the exact figures. I think that the conclusion is obvious that you could handle the traffic with less trains if you were not faced with a limit law. That is the expression of the expert; but it is also the opinion, the expression [fol. 2650] of the people who passed this law in the first place. They wanted more trains.

The Court: Other than the two cases you have cited, have counsel any authority on the matter of this study being admitted to prove a certain point, to illustrate it, and that evidence may be introduced as a result of that study. The Court will be at recess until ten o'clock tomorrow morning, at which time I will rule on the objection.

Mr. Mason: Of course, Your Honor will understand we do not intend merely to present some final figures and say, "We made a study and this is it." We will present each of the men who made the study to explain his methods. We will present all of the steps by which the result was achieved, and we will present to the opposition all of the train sheets, actual and redispatched, all of the work sheets of which the exhibit before you is merely an example, all of the other material mentioned by Mr. Sines in his testimony as having been used, so that they may, if they wish, go through the same process that we did or so much of it as they like, and find out whether we have done our work honestly and well.

The Court: There is one other comment I will make, and I am through. Of course, up to date, while this record [fol. 2651] is replete with figures and statistics, we have dealt in actualities, they are figures taken from your books, records and reports. Now, it seems to me that we might go far afield if we encumber this record with a lot of data, statistical and otherwise, as to what might have been done if the law had not been in existence. In other words, the reshuffling of these trains and their operation. While in one sense your comparison of the architect's problem is a good one, as a matter of fact, in this instance these trains were not operated under the reshuffling arrangement of your redispatching study; it is the opinion of these skilled men that had they had a free hand here is what they could have done. Now, is that proper; that is the question.

(Thereupon, the court stood at recess until Wednesday, January 22, 1941, at ten o'clock A. M.)

[fol. 2652] January [illegible] 1941, Ten o'clock A. M.

Proceedings were resumed at this time as follows:

Mr. Mason: Your Honor, the question before us at the adjournment last night, the specific question before us was as to the admissibility of Exhibit 198, the objection being that it was an expression of an opinion and conclusion of the witness. Now, perhaps Exhibit 198 in so far as it does show the results of the actual redispatching for June 18th between Tucson and Lordsburg eastward is an expression of results, and the witness who actually did the redispatching has not yet testified; so that the offer is premature in that respect. However, it wasn't offered, as I explained at the time, for the purpose of showing results, and that is entirely incidental. It is for the purpose of showing methods, and is merely an example of thousands of these work sheets that were used in the course of this redispatching operation. Perhaps, in order to obviate the objection at this time, it would be well to withhold for the time being the actual offer of the exhibit in evidence. It has been offered for identification, and when Mr. Baker, who was in 1938 and 1939 the chief train dispatcher of the Tucson division, has [fol. 2653] testified, then it will be appropriate to offer the exhibit as an expression of what he did.

The Court: I think it is premature at this time.

Mr. Mason: After the dispatchers have testified there will be before the Court a fuller explanation of what they themselves did in the redispatching study. So far, we have attempted to confine Mr. Sines' testimony to the matter of method and what the man in charge of the redispatching studies asked the dispatchers to do.

The Court: You may proceed.

Mr. Mason: We have prepared, along the lines suggested in your Honor's last statement recorded at the end of yesterday's proceedings, a brief memorandum of some authorities, text-book authorities.

The Court: Mr. Thompson handed that to me.

Mr. Mason: A copy has also been handed to the opposing counsel. In addition, I believe certain case citations have been made available.

The Court: You may proceed.

Mr. Thompson: I will furnish those to Mr. Strouss also.

[fol. 2654] B. S. SINES, resumed the witness stand for further

Direct examination (Continued).

By Mr. Mason:

Q. Will you refer to exhibit No. 196, please, Mr. Sines?

A. Yes.

Q. I believe that so far your discussion has mainly directed itself to item No. 1, the freight redispatching study for 1938 covering the months of June and August of that year on the principal main line via Gila and Lordsburg, is that correct?

A. That is right.

Q. Was there also made under your supervision a passenger redispatching study for the year 1938?

A. Yes.

Q. What territory did that cover?

A. From Los Angeles, California, to El Paso, Texas.

Q. What dispatchers participated in the making of that study?

A. Chief dispatcher Day of the Los Angeles division, chief dispatcher Cassady of the Tucson division, and chief dispatcher Worrell of the Rio Grande division.

[fol. 2655] Q. Did you follow substantially the same methods in the passenger redispatching study for the year as in the freight redispatching study for the two months' period?

A. The preliminary examination of the trains actually operated was as thorough with respect to passenger trains as it was with respect to freight trains. Thereafter, however, the mechanics of performing the redispatching study differed, and we set out only those operations which would have been changed by reason of elimination of the 14-car provision of the Arizona law.

Q. Was it necessary to make any change in the locomotives used to handle the trains, the type of locomotives?

A. No, the passenger locomotive assignment was the same under the redispatching study as it was under actual operation.

Q. Were any alterations or extensions of sidings contemplated as being essential to the passenger study?

A. That was not involved.

Q. Were any passenger trains eliminated from consideration for the purposes of the redispatching study?

A. As I indicated, the preliminary examination em-
[fol. 2656] braced every passenger train and second and extra sections that were run during the year 1938 to determine primarily whether or not any second or extra sections could have been eliminated. Having determined which section or extra sections might have been eliminated, further study was made to determine what the operations would have been if the extra or additional section had not been operated.

Q. That represents the extent of the passenger redispatching study, does it?

A. That is right.

Q. Was it necessary to operate the redispatched passenger trains with the same detail on redispatch train sheets as in the case of the freight redispatching study?

A. No, that was not done either. The work was carried forward to the white work sheet A, the form similar to the exhibit No. 198 for identification.

Q. You show as item No. 3 of the studies undertaken and listed on exhibit No. 196 an analysis of passenger operations for the year 1938. Will you explain, generally, just what this analysis consisted of and how it was undertaken?

A. Yes. In order to comply with the provisions of the
[fol. 2657] 14-car limit for passenger trains in Arizona, it is frequently necessary to perform switching which otherwise would not be performed at such terminals as El Paso, Tucson, Phoenix, Yuma, and Los Angeles. We examined the records to locate instances where such switching had been performed and where it would not have been necessary had there not been the 14-car limit and wrote complete histories of those instances and then analyzed and classified those instances and have set them out in an exhibit.

Q. This was not in the nature of an operation of the same trains or the same traffic in reconstituted trains in lieu of those actually operated, was it, this particular analysis?

A. It involved that consideration also because very often switching had been performed at Yuma which would have been unnecessary had the trains been permitted to run through Arizona with a consist in excess of 14 cars.

Q. Who performed this work of analysis of passenger operation, item No. 3 of exhibit No. 196, in addition to yourself?

A. One of the trick dispatchers assigned to the redispatching party and the chief dispatchers of the three divisions who also performed the passenger redispatch study [fol. 2658] listed here as item No. 2.

Q. Was this analysis undertaken at the same time or during the same working period of 1939 which you have previously mentioned as being used for the freight redispatching study?

A. Yes, it was.

Q. You show as item No. 4 a freight redispatching study, Phoenix to Tucson, month of December, 1938. Was that performed under your jurisdiction and supervision?

A. It was.

Q. By whom was that performed?

A. Chief dispatcher Cassady of the Tucson division.

Q. What was the reason for selecting the month of December, 1938?

A. That is the month when the perishable business is at its peak in the Phoenix territory and when trains of more than 70 cars could advantageously be run between Phoenix and Tucson.

Q. Was the redispatching study of the Phoenix-Tucson line undertaken along the same lines and along the same general principles as the freight redispatching study, item No. 1 of exhibit No. 196?

A. It was, although there again it was not necessary to [fol. 2659] set up the redispatched operations on redispatch train sheets. There were only one or, at the most, two trains involved in each direction in any one day, and the work was carried forward directly on to the white work sheet A.

[fol. 2660] Q. Now, will you please refer to Item 5?

A. Yes.

Q. I note that the period referred to is April 4th to April 30th, 1940. Why was that period selected?

A. That was the period when the Company disregarded the 70 car provisions of the Arizona Train Limit Law.

Q. As to freight trains?

A. As to freight trains, yes.

Q. And what operations were compared, what was undertaken in the redispatching study, Item 5?

A. We endeavored there to ascertain what the savings had been to the Southern Pacific Company by reason of its

long-train operation, and in order to do that it was necessary to recast the business or redispatch it in short trains to find out how many more train miles and locomotive miles would have been required to handle the same amount of business if it had been handled in the shorter trains.

Q. Did you make any assumption or differentiation as to the character of the locomotives used in your redispatched trains as compared with the actual trains operated during the period April 4th to 30th, 1940?

[fol. 2661] A. No.

Q. Did you make any assumption as to siding lengths, any changes in siding lengths?

A. No.

Q. Did you make any assumption as to change of conditions other than the assumption that for the purpose of the redispatching study the 70-car law would be observed instead of being disregarded?

A. That was the only consideration.

Q. What plan was followed with respect to the operation of your redispatched short trains of 1940 as to time through terminals?

A. The trains were dispatched from the initial terminals at the same times as the trains had operated actually; times through intermediate terminals depended upon the amount of work to be done on the trains in accordance with the experience and judgment of the dispatchers that were handling the redispatching study.

Q. By the way, what dispatchers handled the redispatching study for the 1940, particularly Item 5?

A. Chief Dispatcher Cassady of the Tucson Division, and Chief Dispatcher Herrell of the Rio Grande Division.

Q. Were they assisted by trick dispatchers?

[fol. 2662] A. They were.

Q. Did you otherwise follow the same outline of principles and procedure that you have presented in detail with respect to Item 1 of exhibit No. 196?

A. Quite generally, with this exception that whereas in 1938 the dispatchers had matched the operation of the redispatched train with an actual train on the basis of percentage of tonnage to rating of locomotive, the dispatchers didn't do this in the short trains redispatched for 1940, but set up the time of dispatching between terminals and points on the railroad in accordance with the performance of

trains as they had observed them for the past ten or fifteen years in actual operation.

Q. Were there any other differences between the manner in which the redispatching study, Item 5, was conducted, and the manner in which the redispatching study of 1938, Item 1, was conducted?

A. None of any moment, that I can recall now.

Q. You show here as Item 6 a further redispatching study relating to the operation between April 4th and April 30, 1940. Will you state just what the redispatching study thus undertaken was?

[fol. 2663] A. Yes. As a result of the redispatching study indicated in Item 5, it was apparent that the limitation placed on the long-train operation during the period April 4th to April 30th by reason of the fact that sidings were still short and that the power that we had then was not capable of handling complete long train operations, it was apparent that the railroad had not benefited to the full extent that would be possible had the Arizona Train Limit Law been set aside and had we entered a full long-train program.

Mr. Strouss: I move that that be stricken, Your Honor, that is a conclusion of the witness.

The Court: That is as to the fact that they were not——

Mr. Strouss: Whether they had been fully benefited or not.

Mr. Mason: Your Honor, I submit that the witness is an expert who has made a study and who is expressing results which were apparent to him from that study, and he has carefully described the study. Now, he is also merely laying the foundation or stating the reason for the further study that was made.

The Court: The motion to strike will be denied.

[fol. 2664] A. We undertook still another study of the business handled in April, 1940, once more to determine what we could have done with an AC-8 locomotive as the principal road locomotive, and with sidings extended as we had contemplated extension for the June-August, 1938, redispatch.

Q. Did you, for the purposes of your study, identified as Item 6 of Exhibit 196, contemplate the same siding extensions which are shown as contemplated on Exhibit 197?

A. Yes.

Q. And did you contemplate the use of AC-8 power as the principal type of road locomotive?

A. Yes.

Q. On the entire division?

A. Yes.

Q. On the entire district, I should say.

A. Between Yuma and El Paso.

Q. By whom was the actual redispatching under Item 6 performed?

A. By Chief Dispatcher Cassady of the Tucson division, and Chief Dispatcher Herrell of the Rio Grande division, assisted by two trick dispatchers. The makeup of the party was the same in our 1940 study as it was in the 1938 study.

Q. With the exception of Mr. Baker?

[fol. 2665] A. Yes.

Q. Now, when were the two 1940 studies conducted?

A. From July 15, 1940 to about November 15, 1940.

Q. Did you follow the same plan of making the study as you have described for Item 1?

A. Yes.

Q. As to the matter of time between terminals, meets, passes, assignment of delays, and so forth, were there any differences in principle observed as between Item No. 6 and Item No. 1?

A. None at all.

Mr. Mason: Your Honor, at this time I will ask permission to withdraw Mr. Sines. He will return to the stand, of course, in order to present, after the dispatchers have testified, the results of the redispatching study. However, if Mr. Strouss desires to cross-examine him at this time on what has been presented so far, of course he is tendered for cross-examination.

Mr. Strouss: No.

The Court: You may withdraw the witness.

Mr. Mason: There is one other question I perhaps should ask him before he leaves the stand at this time.

[fol. 2666] Q. Was the south line between El Paso and Tucson via Douglas included in the redispatching study for 1940, or either of the redispatching studies for 1940?

A. No.

Mr. Mason: That is all at this time.

The Court: The operations from Yuma to Phoenix were not included either, were they?

A. No.

Q. But there is the one study made of the operations from Phoenix to Tucson?

A. For 1938, yes.

The Court: Call your next witness.

Mr. Mason: We will ask Mr. Baker to resume the stand.

[fol. 2667] Mr. Mason: Your Honor, it occurs to me that I promised last night to qualify Mr. Sines as having supervised and participated in the Nevada Train Limit case redispatching study. I don't suppose there is any doubt in the mind of Mr. Strouss that that is a fact.

Mr. Strouss: I read quite a few pages of record that were under his name.

Mr. Mason: Perhaps without his resuming the witness chair I can ask him now before Mr. Baker testifies as to his participation.

The Court: You may do so.

Mr. Mason: Mr. Sines, will you state whether or not you participated in the Nevada Train Limit case?

A. I did.

Q. Was a redispatching study made for the purpose of the Nevada Train Limit case?

Mr. Strouss: I object to this as immaterial.

The Court: Objection overruled.

A. There was.

Mr. Mason:

Q. Under whose immediate supervision was that study conducted?

A. My own.

Mr. Strouss: My objection goes to all of this.

The Court: Yes.

[fol. 2668] Mr. Mason: It is understood that it does.

Q. Did you assemble a party for the purposes of making that study?

A. Yes, we had a party there that consisted of the chief dispatcher of the Sacramento division——

The Court: (Interrupting) Mr. Mason, I don't think it is necessary that we go into great detail on that. The witness has testified that he did make such a study or it was done under his direction, and I presume, Mr. Sines, it was carried out very similarly to your study that was made here in this case?

A. Very much.

Mr. Mason:

Q. Did you follow substantially the same methods and principles in the Nevada study that you have described as having been followed in connection with the Arizona studies?

A. Yes, the principal difference there being that we were redispatching long trains into short trains.

Q. Whereas in the present case with one exception you were redispatching short trains into long ones?

A. Yes.

Q. I take it, then, that the redispatching study, No. 5 of your exhibit No. 196, was a redispatching study very [fol. 2669] similar to the one undertaken in Nevada?

A. That is right, it was a counterpart of that study.

Mr. Mason: I think that is all.

(Witness excused.)

G. C. Baker was recalled as a witness in behalf of the defendant and having been previously sworn testified further as follows:

Direct examination (Continued).

By Mr. Mason:

Q. Mr. Baker, you have previously stated that you were a dispatcher and subsequently chief dispatcher on the Tucson division?

A. Yes.

Q. You have also had experience as the agent at Yuma?

A. Yes, sir.

Q. And as a dispatcher at El Paso on the Rio Grande division?

A. Yes.

Q. Will you describe the primary duties of the chief dispatcher of a division or district?

[fol. 2670] A. The chief dispatcher arranges for and supervises the movements of trains over the division of which he has jurisdiction; provides the necessary crews and power at various terminals and helper stations to protect the movement of trains; supervises the work of train dispatchers, telegraphers, station agents, and arranges with the yard masters at the various terminals as to the amount of tonnage and class of power to be furnished each train and also watches the time of livestock in transit in compliance with the Federal law; also provides for the picking up of loads and empties at intermediate points and the distribution of empty cars to protect the requirements of the shippers; watches very closely the schedules of the various freight and passenger trains in order that the schedules will be maintained or recover as much time as possible under existing conditions, such as weather conditions, track conditions, tonnage being handled, and so forth.

Q. Does he supervise directly the work of the train dispatchers?

A. Yes.

Q. You heard the testimony of Mr. Sines yesterday as to the work performed by trick dispatchers, did you?

[fol. 2671] A. Yes, sir.

Q. Are the trick dispatchers immediately under the jurisdiction and direct supervision of the chief train dispatcher?

A. Yes, sir.

Q. Mr. Baker, is it necessary to make separate provision day by day for the crews and locomotives to handle passenger trains?

A. No, not the regular passenger train crews; the crews are regularly assigned for those particular runs, trains that operate every day.

Q. Where extra passenger trains are to be operated, what does the chief train dispatcher do?

A. It is necessary then to provide the proper power and crews for those extra trains.

Q. Turning to freight trains, are main line through freight trains operated with the same regularity as passenger trains?

A. No, their departure from the terminal is governed to a large extent by the amount of tonnage that is available to move received from the connecting divisions and also as a

rule in handling unidentified trains, such as drags and empty reefers, the chief dispatcher generally lines up that operation to fit in with the opposing movement in order that he may protect his power and crew

[fol. 2672] Q. Does the amount of traffic to be moved have any effect upon the number of freight trains to be operated?

A. Yes.

Q. Does the number of freight trains operated on the division fluctuate from day to day?

A. Yes, it does.

Q. And the number operated out of a particular terminal in a particular direction may fluctuate from day to day?

A. Yes, sir.

Q. For example, in determining the number of freight trains to be operated eastward out of Yuma on a particular day what special considerations govern?

A. We receive advance line-ups or flashes at Yuma in this particular case from the chief dispatcher at Los Angeles and we then arrange to reconsist the trains in order that the number of cars may be moved in the least number of units possible and the train is lined up out of Yuma in order that they may take care of any short traffic to be picked up between terminals.

Q. In lining up your trains to be moved out of Yuma, do you have in mind schedule or time requirements on the eastbound traffic?

[fol. 2673] A. Yes, the schedule is the main requirement with identified freight trains.

Q. Do similar considerations govern as to the trains operated westward out of Lordsburg?

A. Yes.

Q. In originating trains at Tucson either eastward or westward, what do you have in mind?

A. We have to give the same consideration as to how the trains are on schedule and the power available and whatever work there is to be performed on the line in the picking up and setting out of traffic at intermediate stations.

Q. Do you obtain in advance information from the Los Angeles division?

A. Yes.

Q. How far in advance of the arrival of the traffic at Yuma does your information usually reach you?

A. Our first information giving a tentative line-up is received from sixteen to eighteen hours in advance of the actual arrival of the train at Yuma.

Q. What does that advance information include, what information as to the trains or the traffic?

A. It generally gives the identification of the train and [fol. 2674] the approximate arrival of the train at Yuma.

Q. Do you receive similar advance information from the Rio Grande division?

A. Yes, sir.

Q. How far in advance of arrival at Lordsburg do you generally get that information?

A. Approximately the same time, sixteen to eighteen hours, our first information.

Q. Do you receive any supplementary information from those divisions?

A. Yes, these line-ups are supplemented from time to time in order that after the trains have actually departed from El Paso or Los Angeles and Colton we will know the actual number of units that are to be received at those points, either at Yuma or at Lordsburg.

Q. Do the yard masters at points such as Colton where trains are made up give you any information?

A. Yes, as soon as the eastward perishable trains leave Colton, we are furnished with the information as to the number of perishable, manifest, dead loads, and empties that are in that train leaving Colton.

Q. How far in advance of arrival of the Colton blocks at [fol. 2675] Yuma would the information from the Colton yard master reach you?

A. Approximately nine to ten hours, sometimes twelve hours in advance.

Q. Does the yard master at Yuma send out advance information after trains have arrived or trains have been made up at Yuma?

A. Only the consist. When the train departs from Yuma, the information is given to the trick dispatcher by the operator at the Yuma yard, showing the time that the train departs from Yuma. However, the information as to what the train consists of, there is a detailed consist filed by the yard master and transmitted immediately upon departure of the train.

Q. To whom is that transmitted?

A. The chief dispatcher at Tucson and the chief dispatcher at El Paso.

Q. That is flashed ahead to El Paso?

A. Yes, sir.

Q. Is a similar advance flashed of the consist of the train as it departs made up at Tucson and sent on ahead of the train to El Paso?

A. Yes, as soon as the train departs from Tucson, then a detailed consist is filed by the yard master at Tucson addressed to the yard master at Lordsburg and the chief dis- [fol. 2676] patcher and yard master at El Paso.

Q. Is similar advance information given by yard masters, for example, at El Paso covering the movement of westward trains?

A. Yes, sir.

Q. What use does the chief train dispatcher, and yourself as chief train dispatcher particularly, make of this advance information?

A. Well, I use these consists to plan my operations for the day, that is, of the traffic that is to be received, taking into consideration at Yuma, for example, the number of cars which I am permitted to handle or the class of power that I have and the tonnage which that certain type of power could handle and the number of loads that I may have to pick up at intermediate stations in order that the proper number of cars may be ordered on these trains out of their various terminals.

Q. Are there any away-from-home terminals for train and engine service employees on the Tucson division?

A. Yes, the away-from-home terminal for the crews operating east out of Yuma is Gila and Gila is also the away-from-home terminal for the crews operating westward from Tucson. Lordsburg is the away-from-home [fol. 2677] terminal for the crews operating eastward from Tucson.

Q. Do you have to make provision for crews to be present at those points in order to move trains which change crews there?

A. Yes, I have to make arrangements well in advance in order that the proper power and crews will be available at these away-from-home terminals to protect the traffic moving.

Q. Do you maintain a pool or reserve of locomotives at Gila and Lordsburg?

A. No, we occasionally may have what we call a "drop-back" engine in order to expedite the movement of trains through those terminals.

Q. You don't maintain any substantial number of locomotives there to protect the movement?

A. No, it is merely a protection engine.

Q. How do you arrange to have crews and locomotives available at those away-from-home terminals to handle the movement of trains?

A. The number of crews required is determined by these advance line-ups that we receive from the connecting divisions and then we see the number of trains that we have to operate westward, the number of trains that we have to protect eastbound, I am talking about Gila now, and unless the power and crews will balance at those points it is neces-
[fol. 2678] sary in order to get power to double-head the train and dead-head the crews to Gila in order to balance the unbalanced trains.

[fol. 2679] Q. Do you have to take these steps, or double-head and deadhead, in other words, in getting the engines and crews to Gila substantially in advance of the arrival of trains?

A. Yes, in case of our train crews, it is necessary that they arrive at the outside terminals in time that they may be fully rested in accordance with the Federal law or local agreements with the brotherhoods.

Q. About how much time in advance do you have to make arrangements for the departure of crews from the home terminal in order to protect an unbalanced movement?

A. Well, it depends on the districts, the district or the away-from-home terminal at Yuma, it is necessary that we know at least from 12 to 16 hours in advance of the requirements at that point in order to get the crews there so they will get the proper rest.

Q. Suppose you have to move crews and power to Lordsburg, what advance notice do you have to have?

A. Well, at least 20 hours.

Q. Does it ever happen that there are more trains moving westward to Gila than are moving eastward from Gila?

A. Yes, that is the case quite often.

[fol. 2680] Q. What happens to the surplus locomotives and surplus crews in that case?

A. Well, then we are required to doublehead the surplus locomotives back east and deadhead the surplus crews back to their home terminal at Tucson.

Q. Do you move the engines back coupled to another train when you speak of doubleheading?

A. We do unless the tonnage in the train exceeds the rating of the heaviest locomotive, then we are required to run the engine light, except over the helper district between Gila to Estrella, we can couple them in there without penalty.

Q. You run the engine light. Does that mean without any cars?

A. Yes.

Q. You speak of deadheading crews. Are crews and cabooses particularly assigned one to the other?

A. Yes.

Q. When you deadhead a train crew as distinguished from the engine crew, do you also deadhead a caboose?

A. Yes.

Q. Now, what happens if a train and engine crew is held at Gila without any work to do because of having gone there [fol. 2681] with a train and finding no train on which to return for service?

A. Well, unless the service is not required, why, we deadhead them back. However, there are times when we have no way to deadhead the crew back, or it may be that we may wish to hold this crew at Gila an excessive length of time to avoid the deadheading of another crew from Tucson. However, when that is done and the crew is at Gila, is away from home terminal more than 16 hours, then he starts drawing pay and he draws eight hours' pay in every 24 hours after that he is held at that away-from-home terminal.

Q. And what do you call that type of compensation?

A. Held away from home terminal.

Q. What are some of the circumstances that lead to an unbalance of trains in opposite directions over the Tucson division?

A. Well, the perishable movement, or shortly after the perishable movement commences there is a heavy return movement of empty refrigerator cars westward, which return through the Tucumcari and El Paso Gateway and which it is necessary for us to work as far north as up in

the Santa Maria Valley and San Joaquin Valley, and also [fol. 2682] take care of the requirements in the Salt River Valley, Yuma Valley and Imperial Valley, and the number of cars operating westward is much in excess of the eastward movement, which causes an unbalance of train-miles.

Q. Why does it cause an unbalance of train-miles? Why not make the westward trains longer than the eastward trains?

A. Well, we are restricted to seventy cars through Arizona under the Arizona law.

Q. Is there any preference as to movement of trains over the division as between particular types or kinds of trains?

A. Yes, passenger trains are given first preference. They have preference to freight trains and our west manifest trains, which are on a very fast schedule, are usually given preference over our perishable trains, and, of course, perishable trains are given preference over drag or freight trains of less importance, in which no schedule is required to be made.

Q. Does the chief dispatcher have anything to do with the designation of preferences as between trains?

A. Yes, he generally issues necessary instructions, or, however, the dispatchers know generally the class of trains [fol. 2683] which is to be given preference and handles his trains accordingly over the road in order that the preferred train will receive the best possible handling.

Q. Now, I think you stated initially that the chief dispatcher supervises the movement of trains. Who actually issues the orders for the movement of trains out of terminals and over the road?

A. The trick dispatchers.

Q. And what is the primary problem of the chief dispatcher and the trick dispatcher with reference to the movement of trains?

A. Well, the principal problem is to move the trains over the dispatcher's district or the district in which he is handling the trains in the manner in which delays for meeting and passing will be at a minimum, and keep his passenger trains on time, on schedule, or handle them in a manner so that they will recover it if they are late, giving freight trains the benefit of any late time that the passenger trains may be operating. In fact, the idea is to get the trains off the district as quick as he can so that he won't be bothered with them; that is the idea.

Q. On a railroad such as the Tucson Division, I take it that the big problem in getting the trains off the division [fol. 2684] is getting them by each other?

A. That is correct.

Q. Is the problem of meets and passes one of the principal problems facing the dispatcher operating the trains?

A. Yes, that is his chief problem.

Q. Is that problem simplified or rendered more complicated if more trains are operated?

A. Well, the more trains that are operated, why, the problem of the trick dispatcher is very much multiplied, more meets and more passes, why, his work is multiplied to that extent.

Q. Is there always a trick dispatcher on duty at division headquarters?

A. At all times, yes.

The Court: We will take our morning recess at this time.

(Thereupon, a short recess was taken, after which the witness was recalled to the stand, and proceedings were resumed as follows:)

The Court: You may proceed.

Mr. Strouss: If you want to put in the record now——

Mr. Mason: With respect to Exhibit 13. Your Honor, as a result of discussion with Mr. Strouss, during the inter- [fol. 2685] mission, we have reached an understanding with respect to Exhibit No. 13. Your Honor will recall that that was introduced by General Manager Wright of the New York Central, and at the time the train sheets were not available. We have made arrangements to have the train sheets brought here by Mr. Wright, by another witness equally qualified, but now Mr. Strouss states that he is willing to waive the production of the train sheets, and so far as his objection to No. 13 was predicated upon the failure to produce the underlying records, that objection may be considered withdrawn.

Mr. Strouss: Yes.

The Court: Then you are re-offering the exhibit?

Mr. Mason: Yes. It has previously been received, but your Honor indicated some doubt as to the propriety of the ruling first made. That ruling, I take it, may now stand as to the objection to competency. The objection as to materiality and relevancy is not withdrawn, I understand.

The Court: That completes them, does it not?

Mr. Mason: I believe that completes all the exhibits so far tendered along this line.

Q. Mr. Baker, are the train sheets made up under the [fol. 2686] supervision of the chief train dispatcher?

A. No, that is the duty of the trick dispatchers. I understand you mean the heading up of the train sheets?

Q. What I mean is this, this is one of the duties of the trick dispatchers, is it?

A. Yes.

Q. And is performed by them at the office of the chief dispatcher and trick dispatcher?

A. Yes, sir.

Q. Like their other duties, is it performed under the supervision of the chief dispatcher?

A. Yes.

Q. Is the chief dispatcher familiar with the train sheets of his division?

A. Yes, that is where the chief dispatcher gets his information as to the number of cars that he is operating and also the condition of the train, that is, with respect to schedules, the tonnage, and so forth.

Q. Does the chief dispatcher make regular and daily use of the entries on the train sheets?

A. Yes, he refers to that many times during his tour of duty.

Q. And the train sheets are kept in the chief dispatcher's [fol. 2687] office, are they?

A. Yes.

Q. How many train sheets are there for each district for each 24-hour period?

A. There is one train sheet for each 24-hour period for each district worked. However, there is occasion when a trick dispatcher may have two train sheets to work with, due to the length of his district or it may be necessary that two train sheets be provided.

Q. There will be a train sheet for each portion of the district which he is working?

A. Yes.

Q. Now, what entries are particularly recorded on the train sheets?

A. Well, the sheets are headed up, first it shows the train number, and then it is followed with the conductor, the

engine crew, and the engine number, and then the first entry, of course, is the time of departure at initial station, showing the number of cars and tonnage which the train has leaving that point.

Q. Is that detail recorded for each train operating over the district?

A. Yes, every train must be recorded on the train sheet, every movement.

[fol. 2688] Q. Now, are the times at other stations recorded to show the progress of the train?

A. At all open telegraph offices where the train is reported the time is reported on the train sheet.

Q. Do you show the identification of the train as well as its number, if there be a separate identification?

A. Yes, we show for instance, in the case of a perishable train, the identity of the train.

Q. Suppose a train leaves the terminal tonight, let us say, at eight o'clock, where is the movement of that train carried if it continues on the district after twelve midnight?

A. It is continued on that same sheet through to its destination.

Q. Then, after midnight there might be two train sheets before the same trick dispatcher covering the same district?

A. Yes, sometimes four train sheets, he may have to work with four train sheets.

Q. That is where he has two separate districts covered by two separate train sheets?

A. Yes.

Q. Does the train sheet show the time that it arrives at its final terminal?

[fol. 2689] A. Yes.

Q. Suppose a second locomotive is attached to the train, does that information appear on the train sheet?

A. Yes, all that information is carried on the train sheet, and shows what particular train it is attached to. There is a column provided for that purpose on the train sheet.

Q. Are light engine movements shown on the train sheet?

A. Yes.

Q. Do you show any of the details of the consists of freight trains on the train sheets?

A. No, nothing other than the table of loads and empties and their tonnage.

Q. Do you show distribution as between perishables, manifests, and livestock?

A. No, not on the train sheets.

Q. Do you show any classification as between company materials and other non-revenue freight and revenue freight?

A. No.

Q. Do you show any of the car numbers?

A. No.

Q. How does the dispatcher obtain the information as to the time that the train arrives at or departs from interme-
[fol. 2690] diate stations along the route

A. We have progress of the train reported by station agents or telegraphers at various points along the line.

Q. Now, how does the dispatcher arrange for changes in the movement of a particular train, or instructions as to its movement?

A. By the use of train orders.

Q. How does he get those train orders to the train?

A. They are transmitted to operators at various points along the line and addressed to the conductor and the engineer of the train to which the instruction refers, and in case of a train stopping they are generally delivered to the train conductor. However, at points at which trains do not stop, they are handled by means of a train order hoop, one order being delivered to the engine crew and one to the train crew on the caboose.

Q. Train orders are delivered in that manner to the engine and caboose of the train for the engineer and conductor both?

A. Yes.

Q. Is that done without the necessity of the train stop-
[fol. 2691] ping?

A. Oh, yes.

Q. How does the agent or operator advise the train that orders are on hand for that train?

A. Well, that is done by means of a train order signal or semaphore. When there are no orders for a train after a train reaches a point close to the train order office, if there are no orders or instructions for this train, the semaphore signal is put in a proceed position.

Q. That is with the arm down?

A. With the arm down; and if there are train orders or instructions for the train, the signal is left in a stop posi-

tion, or horizontal position. Then before a train can pass a train order office with the train order board in a stop position, it is necessary that they proceed to clearance, as we call it. On that board, it may not contain orders but it is necessary that he obtain a clearance from the operator on duty, which carries the signature of the chief train dispatcher, that they have or have not orders for this train unless he obtains this clearance.

Q. Can he obtain that clearance by having the orders handed up to him by the hoop?

A. Yes.

[fol. 2692] Q. Then he doesn't actually have to stop because the train order board is in the stop position?

A. No, as long as he receives a clearance permitting him to pass the train order signal.

The Court: But if there was any slip-up, and the train is in motion, the agent or operator there at the station failed to connect with him and give him his orders, then he would have to immediately stop?

A. Yes, he has to stop and back up and receive the clearance on the train-order sheets.

[fol. 2693] Q. By "slip-up," for example, would be where the hoop was missed?

A. The hoop was missed or the operator at the back end didn't hear the train coming or something.

Q. You have heard the expression and I think you have used the expression "drags" or for unidentified trains. What does the term "drag" mean?

A. "Drag" generally is referred to as a train that does not carry an identifying symbol, such as manifest trains, Colton fruit block. It generally consists of dead freight, company material, company oil, empties; it is an unidentified train is what it is and they are referred to as "drags."

The Court: All other trains would be given the right of way over this "drag"?

A. Yes, sir.

Mr. Mason:

Q. When a train is given preference over another train, the two moving in the opposite direction, what actually happens at the meeting point?

A. The inferior train, it is necessary for the inferior train to take siding. The superiority of trains is determined in several different ways, one is by timetable schedule or special instructions in the timetable over train orders.

Q. The chief dispatcher working through the trick dis-
[fol. 2694] patcher can establish the superiority?

A. Yes, you can reverse the superiority of any train.

Q. Can you give a perishable or manifest train the right to hold the main line as against a drag or unidentified train?

A. They generally do. You can by train order give a freight train, establish a freight train and make him superior to the passenger train or any other train on the road by train order.

Q. Is it part of your duty as chief train dispatcher to be familiar with the physical characteristics of the lines subject to your jurisdiction?

A. Yes, that is very necessary.

Q. Precisely what do you mean by the term "physical characteristics," or, in other words, with what physical characteristics are you particularly familiar?

A. It is necessary that we be familiar with the grade conditions, curvatures, side track capacities, location of train order offices, location of signal maintainers, section forces, bridge forces, location of our wrecker or relief outfits.

Q. Do you have to know where double track begins and ends?

[fol. 2695] A. Yes, sir.

Q. Do you have to know the mileage between stations?

A. Yes, sir.

Q. The location of junction points and the mileages to and from them?

A. That is right.

Q. Do you have to know anything about the ability of locomotives to handle tonnage over various parts of the line?

A. Yes, we have to be familiar with the tonnage rating of all locomotives.

Q. Do you have to be familiar with their ability as related to particular portions of the line?

A. Yes, sir.

Q. You spoke in your previous testimony the fact that you receive advance line-ups several hours in advance of

the actual arrival of the trains at the terminals of the division and that you do know in advance in order to make provision for crews at away-from-home terminals. I will ask you whether as chief dispatcher or as supervisor of the work of the trick dispatchers you make in advance plans otherwise for the handling of traffic over the division? [fol. 2696] A. Yes, in this way. At Tucson we have shops maintained by the Pacific Fruit Express in which we store a large number of reefers and we operate these empty refrigerator trains out of Tucson westward at an hour which will best fit in with the eastbound operations. Of course, those are trains which are not included on any line-ups received from any connecting division.

Q. Speaking of the line-ups, do you use this line-up from connecting divisions for any purpose in planning your day or do you simply let the trains go without any particular plan for the day?

A. No, we use those line-ups to plan our operations for the day, for the next twenty-four or forty-eight hours as far as that is concerned.

Q. Do you plan ahead as far as twenty-four or forty-eight hours for train movement on your division?

A. Yes, sometimes as much as three days in advance you have to plan your operations.

Q. Having planned your operations in advance, does that plan stand without any change?

A. No, that is changing constantly all the time.

Q. What is it that causes it to make changes?

A. Several things can cause a train to be delayed, such [fol. 2697] as washouts, derailments, or other unforeseen operating delays, or it may be that the traffic that the connecting chief dispatcher had in mind did not materialize due to weather conditions or they couldn't harvest their crops, such as lettuce and other commodities. Innumerable things can enter into the change in the original line-up.

Q. When these changed conditions arise, you have to meet them, do you?

A. Yes.

Q. What do you do with your contemplated plan of operation?

A. We have to change it to conform with the latest line-up. It may be that we have to dead-head crews or double-head power to away-from-home terminals and it

may be necessary in order to avoid heavy penalties to probably return the same crews at times.

Q. Without any work for them to do?

A. Yes.

Q. You heard the testimony of Mr. Sines as to the redispatching study of 1938, item No. 1 of his exhibit No. 196?

A. Yes, sir.

Q. Do you recall his having mentioned your name as one [fol. 2698] of the party participating in the study?

A. Yes, sir.

Q. Do you recall approximately when you went to Los Angeles for the purposes of the study?

A. As I recall, it was about May 15, 1939.

Q. You were then chief train dispatcher of the Tucson division?

A. Yes, sir.

Q. You heard the testimony of Mr. Sines as to the methods evolved and plan contemplated for the purpose of that 1938 redispatching study?

A. Yes, sir.

Q. You heard his testimony as to the instructions laid out to be followed in working out the study?

A. Yes, sir.

Q. I will ask you whether, as the chief dispatcher for the Tucson division participating in the study, you followed that plan and conformed to those instructions in performing that study?

A. Yes, I did.

Q. Did you personally make the entries in the redispatched train sheets showing the distribution of the traffic into the redispatched trains?

A. Yes.

[fol. 2699] Q. Was the movement of the redispatched trains conducted under your supervision as the chief train dispatcher?

A. Yes.

Q. Mr. Baker, I take it there are certain definite methods and principles which dispatchers, including yourself as a former trick dispatcher and chief dispatcher, necessarily follow and employ in performing their duties as dispatchers. Now I will ask you whether in the redispatching study and for the purposes of the redispatching study you followed any different methods and principles than

those which you follow and have followed in the conduct of actual operation?

A. No, they were essentially the same except the train dispatcher did not issue actual train orders, but as far as the lining up or consisting of trains it was the same except that we consisted the train of greater length than we did in actual operation.

Q. You made up trains to fit the AC power which was contemplated in the redispatching study?

A. Yes.

Q. And to fit the longer sidings contemplated for that purpose?

A. Yes.

[fol. 2700] Q. Without regard to the 70-car or 14-car restriction, as the case might be?

A. That is right.

Q. Did you in the course of the redispatching study undertake to maintain a balance of power and crews?

A. Yes.

Q. Did you follow any different method for this purpose than you follow in actual practice?

A. No, the same method.

Q. Did you dead-head crews and double-head locomotives where necessary to obtain a balance?

A. Yes.

Q. Did you maintain a record of power and crews for that purpose?

A. Yes, we did.

Q. Is that record a part of the papers of the redispatching study?

A. Yes, sir.

Q. Mr. Baker, you have before you the movement of an actual train over the district, let's say from Yuma to Gila, as recorded on the actual train sheet, the tonnage of the train being 90 per cent of the engine rating of the locomotive handling it, and you have before you on the redispatched train sheets a train to be moved from Yuma to [fol. 2701] Gila, the tonnage of which is likewise 90 per cent of the engine rating of the AC-8 type locomotive between Yuma and Gila. Will you say whether or not you can determine from the movement of the actual train the time which may and will be taken by the redispatched train?

A. Yes, they would conform very closely, practically the same; under similar operating conditions they would be the same.

Q. Suppose the contemplated movement of the redispatched train was on the same day as the movement of the actual train with which it is compared, what would be the result then?

A. I would figure that that train would make the same speed over the district as the actual train.

Q. Suppose that the redispatched train was required to meet a similar number of westbound trains that were actually met by the train on the actual train sheet, what would be the effect on the total time enroute?

A. The amount of delay that was incurred by the actual train, of the train that was eliminated, would be deducted from the redispatched train to enable them to reach their terminal that much sooner. They wouldn't be delayed [fol. 2702] by this train that was eliminated, that delay would be eliminated.

Q. The elimination of meets and passes, then, would lead to a better or shorter time enroute?

A. It would be a better performance and a shorter time on the district.

Q. Suppose instead of having the redispatched train with the same percentage of tonnage rating as the actual train with which it is matched, you have a redispatched train with a lesser tonnage rating again between Yuma and Gila eastward, that is, a redispatched train having 75 per cent tonnage rating, whereas the actual train had 90 per cent of tonnage rating, would you be able to determine the time which would be taken by the redispatched train as compared to the actual train?

A. Yes, by observation over a long period of years, a train in actual operation you can determine very closely the time that a train will make, that is, with the percentage of engine rating, we can figure that a train powered by a locomotive of approximately 70 or 75 per cent engine rating will make the maximum allowable speed and whenever a train is loaded, by actual observation in handling these trains, we know approximately the amount of time they will use. In this particular case you mention, we did [fol. 2703] allow a train of lesser tonnage to recover a

little time over ascending grades, such as Mohawk and Sentinel in the district between Yuma and Gila.

Q. As contrasted to an actual train with a heavier percentage of tonnage rating?

A. Yes.

Q. Suppose that the redispatched train had practically one hundred per cent of tonnage rating, say, a 95 per cent of tonnage rating, and was to be compared with an actual train having only 70 per cent of tonnage rating moving on the same day, would the redispatched train be operated so as to take more time than the actual train with which it was compared?

A. Yes, that was taken into consideration. We figured it would use more time over the district.

Q. Suppose that an actual train was delayed because of an engine failure, would that fact be shown on the actual train sheet?

A. Yes, that delay would be duplicated or it was duplicated.

Q. It would — shown on the actual train sheet?

A. Yes.

Q. For the redispatched train sheet, would you assign that delay to a redispatched train?

[fol. 2704] A. Yes.

Q. Just which redispatched train would it be assigned to?

A. If the engine failure was on an identified train on the actual, we would assign the engine failure to the identical train on the redispatching study, and in the case of a drag or some unidentified train we would assign it to a drag operating closely at the time that the drag on the actual operation was operated.

Q. For example, suppose the train containing the block identified as C-413 experienced an engine failure between Yuma and Gila, would your assign that same delay due to engine failure to the redispatched train containing C-413?

A. Yes, sir.

Q. Did you make provision for the use of helpers on your redispatched trains on the helper districts on the Tucson division?

A. Yes.

Q. Did you observe any different methods than are observed in providing helpers from day to day?

A. No, we observed the same method. The amount of traffic determined the number of helpers we would have to assign to helper stations.

Q. And the tonnage of the train in relation to the engine [fol. 2705] rating, did that have any effect upon whether a helper would be used or not?

A. Yes, sir.

Q. Departing for a moment from the redispatching study, you recall that in your previous testimony there was introduced, as one of defendant's exhibits, exhibit No. 175, the employees' timetables for all of the divisions of the Pacific lines with the Southern Pacific and as well the timetables of the Western Pacific Railroad Company covering operations of the Southern Pacific trains on the paired track territory in Nevada where Western Pacific rails are used for eastward movement, and at that time you testified a new Western Pacific timetable had become effective on January 5, 1941?

A. Yes.

Q. I will ask you whether you have since obtained further information as to that Western Pacific timetable?

A. Yes, due to protest being filed by other lines, that effective date has been indefinitely postponed, and the timetable shown in that exhibit of the Western Pacific is the current operating timetable.

Q. So that exhibit No. 175 includes all of the operating [fol. 2706] timetables, including the Western Pacific timetables as of the date of its introduction into evidence here?

A. That is right.

The Court: While you are on this timetable matter, did I understand you to testify this morning in response to a question from Mr. Mason that freight trains were not operated on any given schedule?

A. No, that was not the intent of it. What I meant to say was they were not operated with any degree of regularity like a passenger train is on schedule. However, in our operating timetables we have schedules for operating freight trains.

The Court: That is what confused me. I have before me this exhibit No. 175 on your Tucson division and I notice there on the second page of your eastward movement that you list out of Yuma, for instance, four freight trains, 846, 902, 844, and 842, which leave daily at a given

hour. Do I understand that that schedule is not necessarily maintained, that you actually run these trains when there is business to warrant it in spite of the showing here in these timetables?

A. That is right. These schedules are set up for the convenience of the train dispatcher in operating his trains and [fol. 2707] does not necessarily mean that these schedules have anything to do with our perishable or manifest schedules insofar as the schedules are concerned. It is merely for the convenience of the train dispatcher. If he didn't have these schedules in here, it would be necessary for him to operate all his trains as extras. These are merely set up for the convenience of the train dispatcher in handling his freight trains.

The Court: Of course with the passenger trains where you have the public to deal with the passenger can absolutely rely on the fact that a train will leave, we will say, Los Angeles or any given terminal at the hour stated in the schedule.

A. That is right, its advertised schedule to the public.

The Court: That is not true with your freight operation?

A. No.

The Court: Even though you may show here and do show on page 2 four freight trains operating eastward daily. As a matter of fact, those trains would not operate unless there was a volume of traffic to warrant it?

A. That is right. It may be that any one of these second-class schedules shown on page 2 may be annulled [fol. 2708] by the train dispatcher and not used at all.

The Court: Taking it by and large, is that schedule I have referred to here in the main maintained? Are there four trains operating eastward out of Yuma carrying freight on each day?

A. Yes, there is practically every day out of Yuma when business is normal, there are one or more sections of each one of these schedules operated.

The Court: But they don't necessarily leave at the hour stated in this schedule?

A. No, just so they leave within twelve hours of the departing time they are operated on that schedule.

(Mr. Mason:

Q. These schedules to which the Court refers are sometimes known as "phantom" schedules, Mr. Baker?

A. Yes, sir.

Q. That, of course, is mere slang or a vernacular term, is it?

A. Yes, sir.

Q. What actually is done in order to operate freight trains on the schedules shown in the Tucson division time-tables from Yuma to Gila?

A. When there is only one section operating, it is only [fol. 2709] necessary to authorize that train by giving them a clearance card showing the train number and the number of orders at that point. However, if there is more than one section, it is necessary that each section be given an order stating the engine number and what schedule he will assume from his initial terminal.

Q. Do you tell him to run so many hours and minutes late on a particular schedule?

A. Yes, that form of order is used. There are several forms of orders that can be used, but that is one of them.

Q. Will you recite a typical form or order authorizing a train to move as a second section of a scheduled freight train from Yuma to Gila.

A. Take 846, you would give him an order, a signed order number and addressed to engine 3660 and the address, and in the body of the order you would state, "Engine 3660 run as second 846 Yuma to Gila," or in case another section of that train is to be run, it could be modified by saying, "Engine 3660 will display signals and run as second 846 Yuma to Gila," which then gives the train dispatcher authority to originate another section of that schedule at Yuma.

Q. Does your order authorizing the engine to run also [fol. 2710] give him a departure time?

A. No, unless this 846 is due to leave Yuma on the schedule, 4:50 P. M., and it may be that this train is called to depart from Yuma at 6 P. M.; the train dispatcher in order to move westward freight trains against that schedule will issue an order reading, "First 846 run one hour and ten minutes late Yuma to Gila."

[fol. 2711] Q. That will be a separate order?

A. That is a separate order.

Q. And he can issue a corresponding separate order to each other section of 846

A. Yes, or he may include all sections in that one order, stating the time that each section will leave Yuma or the

number of hours or minutes that he will operate late on his schedule.

Q. Suppose that the dispatcher does order the first section to run, let us say, one hour late; then what does the engineer, or what do the engineer and conductor do in their operations?

A. They have to respect this schedule by adding the one hour late, they will respect the one-hour later schedule at all times shown on this schedule between Yuma and Gila.

Q. Simply use the phantom schedule set up in the time-table, adding to it the amount of the time of their running late?

A. That is right.

The Court: Mr. Baker, there is one other question. This is asked purely out of curiosity as to the mechanics of it. Does the dispatcher have before him, the trick dispatcher, a board or chart on which the progress of the train across his division is shown by means of pins or some other [fol. 2712] method, so that at all times at a glance he can tell where those trains are?

A. That is shown on his train sheet. He has his train sheet in front of him, and the time that each train departs from the terminal or passes an open telegraph office, the time is transmitted to him by operators and transcribed on his train sheet, so that he knows all the time, practically all the time, where all his trains are at.

Q. But it is from the train sheet rather than from any chart or board?

A. Yes, from the train sheet.

Mr. Strouss: An experienced dispatcher can tell by just glancing at his train sheet where practically every train on his district is?

A. Yes; in fact, he has them in his head. He doesn't have to look at his train sheet, he knows where his trains are all the time.

Q. That to them is just like a board with pins?

A. That is right.

Mr. Mason: Can you, as chief dispatcher, coming into the room where the train dispatchers are working, tell where the positions of the trains are by looking at the train sheets?

A. Yes, by experience I know almost as well as the train dispatcher where his trains are.

[fol. 2713] Mr. Strouss: There is one other thing. On your schedule there, that information is also for the use of opposing trains when a late order is issued, isn't it?

A. Yes, that is the purpose of it, to operate the trains in both directions.

Mr. Mason: Is this late order of the kind that you have dictated into the record transmitted also to opposing trains or trains in the same direction whose movements may be affected by the train running late?

A. Just to trains of inferior class moving in the opposite direction, except in the case of passenger trains, which are first-class trains, then a copy of that order is given to trains in the same direction, or inferior trains.

The Court: Do any of your divisions in this territory cover more than one different time area? By that I mean like the Pacific Time, or Mountain Time, or is that taken into consideration in forming your divisions?

A. No, the time change on the Tucson division is at Yuma. The Los Angeles division train dispatchers use Pacific time and the Tucson dispatchers use Mountain time.

Q. Well, it happens in this instance, that your time change [fol. 2714] is at Yuma?

A. Yes.

Q. Which is a division point?

A. Yes.

Mr. Mason: The same is used all the way from Yuma to Tucumcari, is it not, Mr. Baker?

A. Yes.

The Court: I should think that the Santa Fe, for instance, where their time changes at Seligman, which is not a division point, they would experience some difficulty in the change of time there?

A. Yes, they would unless they have made some special arrangements for it.

Mr. Mason: Mr. Baker, those schedules that are shown there for second-class trains, referring to the Tucson division timetable which you have before you, suppose that no train is run on the schedule shown for No. 844, is any order issued with respect to that?

A. Yes, an order is addressed to No. 844 at Yuma, and a copy of that order then is given to all westward extra

trains on the line between Yuma and Gila, and at Gila for any other extra trains that may be operated, and the order will read, "No. 844" of such a date, "is annulled Yuma to Gila."

[fol. 2715] Q. Then the schedules shown must either be fulfilled or cancelled by order, is that correct?

A. They are fulfilled or annulled, yes.

Q. Mr. Baker, referring back to the matter of schedules for the handling of perishable eastward and manifest westward, which were discussed in your testimony the other day, I believe that you have testified that you received reports at Southern Pacific terminals and interchange points of the arrivals of scheduled trains moving eastward and at terminal points on the Pacific Coast of the arrivals of scheduled trains moving westward?

A. Yes.

Q. Is that a regular daily report made to the superintendent of transportation?

A. Yes, that is a daily report, that is, on schedules terminating on Pacific Lines we get a daily report of their arrivals.

Q. Now, do you receive a current report of the performance of eastbound perishable scheduled trains as to arrival at Ogden, El Paso and Tucumcari?

A. Yes, daily.

Q. Have you those reports at hand either in the court room or in Tucson?

[fol. 2716] A. Yes, I have them in the court room.

Q. Have you made a study of the number of scheduled trains operated and of the number which made running time in accordance with schedule for the year 1939?

A. Yes, I have.

Q. I wish you would refer first to the identified manifest train known as C. S. Over what route does that train operate?

A. That train operates between——

Q. That is, over what route of the Pacific Lines?

A. Between Ogden and San Francisco.

Q. And how many C. S. trains were operated in 1939?

A. In 1939 we had 688 sections of the C. S. between Ogden and San Francisco.

The Court: I didn't catch, Mr. Baker, what you mean by that symbol "C. S." Has it any particular significance?

A. Yes, that is the identification of our west manifest train that operates between Chicago and San Francisco. It means "California Special," but it is shortened by calling it the C. S.

The Court: We will take our noon recess at this time until two o'clock.

(Thereupon, the court stood at recess.)

[fol. 2717] January 22, 1941, two o'clock P. M.

Proceedings were resumed at this time as follows:

The Court: Will the witness who was on the stand resume the stand?

Mr. Mason: Your Honor, before we resume with Mr. Baker, Mr. Strouss and I have agreed that Mr. Kirk, who returned here from St. Louis with the Missouri Pacific Train sheets, need not remain here for further cross-examination, he and his records may be released.

Mr. Strouss: That is correct.

The Court: Then, Mr. Kirk, you may be released with your records.

Mr. Kirk: Thank you.

The Witness G. C. Baker, was recalled to the stand and testified further as follows:

Mr. Mason: Mr. Baker, I think you had just started at the conclusion of the morning session to refer to the number of identified trains operated, and I believe that you were referring first to the C. S. train over the Ogden route? How many of those were operated, first, as regular sections during 1939?

A. 365.

[fol. 2718] Q. And how many extra sections of the C. S were operated during that year?

A. Three hundred thirty-five.

Q. Or a total of 700?

A. That is right.

Q. Now, of the regular sections operated, how many made their running time in accordance with schedule?

A. Three hundred forty-five, or 94.6 per cent.

Q. And how many of the extra sections made their running time in accordance with schedule?

A. Three hundred twenty-three, or 96.5 per cent.

Q. Is there an identified manifest train known as the S. S. W.?

A. Yes, the Sunset West.

Q. Is that one of the trains referred to by schedule on your exhibit No. 176?

A. Yes, if is.

Q. How many regular sections of the S. S. W. were operated during 1939?

A. Three hundred sixty-five.

Q. And how many of those made their running time in accordance with schedule?

A. Three hundred forty-six, or 94.8 per cent.

Q. Did you operate extra sections of the S.S. W. during [fol. 2719] 1939?

A. Yes, there were 48 sections operated.

Q. How many of the extra sections made their running time in accordance with their schedule?

A. Forty-six, or 95.9 per cent.

Q. You also refer on exhibit No. 176 to a train called the G. B. W. or Gold Ball West; is that also operated over the route through Arizona?

A. Yes.

Q. How many of those did you operate during 1939, first, as regular sections?

A. Three hundred sixty-five regular sections.

Q. And how many of those made their running time in accordance with schedule?

A. Three hundred twenty-six, or 89.4 per cent.

Q. Did you operate extra sections of the G. B. W. during 1939?

A. Yes, there were 411 extra sections operated.

Q. How many of those made running time in accordance with schedule?

A. Three hundred fifty, or 85.2 per cent.

Q. How many identified fruit blocks were operated eastward from Roseville over the Ogden route in 1939?

A. Sixteen hundred eight.

Q. And how many of those made running time at Ogden [fol. 2720] in accordance with schedule?

A. One thousand four hundred twenty-eight, or 88.8 per cent.

Q. How many identified fruit blocks were operated from Colton to El Paso in the year 1939?

A. Well, including the train that was split at Yuma, there were operated into El Paso 1,528 Colton blocks.

Q. How many of those Colton blocks made running time at El Paso in accordance with schedule?

A. One thousand two hundred sixty-one, or 82.5 per cent.

Q. Now, were a number of these Colton blocks also operated on to Tucumcari?

A. Yes, they were consolidated at El Paso, that is, the Rock Island traffic taken out, and there were 800 blocks operated east of El Paso through Tucumcari.

Q. And how many of those 800 made running time at Tucumcari in accordance with schedule?

A. Seven hundred fifty-eight, or 94.8 per cent.

Q. Are these totals all taken from the records in the office of the superintendent of transportation to which you referred in the beginning of this portion of your testimony?

A. Yes, that is correct.

[fol. 2721] Q. And the computations, I take it, are your own?

A. Yes.

[fol. 2722] The Court: Before you leave that, just what was the purpose of this last testimony?

Mr. Mason: Your Honor, we have had testimony from each of the other railroads as to performance in accordance with schedules. Of course, a schedule, if placed on paper, doesn't mean much unless it is lived up to, at least reasonably lived up to and the purpose is to show that we not only published and provided these schedules for the handling of manifest westward and perishable freight eastward but that we also performed in accordance with these schedules a substantial and, in fact, a very great proportion of the time.

The Court: You were seeking to draw any comparison between the traffic routed over the Arizona route on your southern lines and that routed through Ogden?

Mr. Mason: I think that such a comparison is possible, yes, and the figures over the two routes might very well be contrasted for the purpose of showing whether performance over the southern route is as good or better or worse than the performance over the more northern route. Of course the testimony is particularly pertinent in showing that schedules are maintained and on-time performance realized with long-train operation across Nevada where

[fol. 2723] the testimony already established that such operation prevails. That supports one of our allegations in the affirmative answer substantially to that effect, that with the long-train operation it has been possible to shorten schedules and make on-time performance.

Mr. Strouss: If that is the purpose, I want to show an objection that it is irrelevant and immaterial.

The Court: The objection is overruled.

Mr. Strouss: Did I understand the performance as to Roseville, to where was that?

Mr. Mason: to Ogden. Wasn't that correct, Mr. Baker?

A. Yes, sir.

Mr. Mason: I think my question referred to Ogden.

Q. Mr. Baker, I think in your testimony this morning you stated that you supervised generally the work of the trick dispatchers who worked jointly with you in performing the redispatching study so far as the Tucson division was concerned. Is that correct?

A. That is right.

Q. Did you yourself place certain of the entries on the redispatched train sheets?

[fol. 2724] A. Yes, I placed the crews, class of power, and the time of departure from Yuma, and also the number of cars to be handled; also entered upon the train sheets for the information of the trick dispatcher the points at which trains would set out and pick up at intermediate points.

Q. Did the trick dispatcher make certain other entries upon the train sheet?

A. Yes, the trick dispatcher, to start with, entered the performance of the actual train in the column adjacent to the column reserved for the operation of the redispatched train, and he entered the times at stations as the redispatched train progressed across the district, he entered the times at the various stations on the district.

Q. He actually operated the redispatched train across the district after you had started it, is that it?

A. Yes.

Q. Did you supervise the making of such entries by the trick dispatcher?

A. Yes, I supervised the work of the redispatched trains that the trick dispatcher performed just the same as I would in actual practice.

Q. After the entries had been made by the trick dispatcher, did you check such entries to see whether they were [fol. 2725] correct?

A. Yes, I did.

Q. What was the reason or purpose of your checking the entries made by the trick dispatcher showing the progress of the train?

A. I thought that I was personally responsible for that redispatching study that had been assigned to me the same as I would have the same responsibility in actual practice.

Q. Did you determine whether or not the operation of the redispatched trains was in accordance with the established principles of dispatching and particularly the conditions governing at the time the actual and the redispatched trains were run?

A. Yes, I did.

Q. Did you check particularly as to the times over the road taken by the redispatched trains?

A. Yes.

Q. Did you check on the meets and passes which were made by such trains?

A. Yes, I did,

Q. Did you make any check of the use of helpers on those trains?

A. Yes.

Q. Did you make any check of the times spent by the trains at intermediate terminals or in passing through terminals?

[fol. 2726] A. Yes, that was one of my duties, to determine by the amount of work that would line up for those particular trains, the amount of time that would be used through any particular terminal.

Q. Will you state whether or not the entries on the redispatched train sheets for the 1938 redispatch which were made by you or under your supervision reasonably and accurately represent the operation of those redispatched trains as it could and would have occurred under the conditions governing the redispatching study?

A. Yes, to the best of my ability I tried to and did supervise that work, the redispatching of the trains, just the same as I did in actual practice.

Mr. Mason: That is all we have for Mr. Baker.

Mr. Strouss: I think it is preliminary to again offering the exhibit so I will ask a few questions.

Mr. Mason: As to the reoffer of exhibit No. 198?

Mr. Strouss: Yes.

Mr. Mason: We will have Mr. Sines back on the stand before we reoffer No. 198 because I will have the witness who made the entries of wages also testify as to just how [fol. 2727] he did that.

The Court: You may cross-examine then, Mr. Strouss.

Mr. Strouss: Just a few questions I want to ask at the present time. I don't want to finish my cross-examination but on this particular thing I would like to ask a few questions.

Cross-examination.

By Mr. Strouss:

Q. Mr. Baker, in dispatching trains or redispatching trains here, the availability of traffic is an important item?

A. That is right.

Q. Your dispatching of trains depends to a great extent upon the traffic which is available?

A. Yes.

Q. And when available?

A. That is right.

Q. So that in order to properly dispatch trains you have to know what traffic is available and when it is available?

A. That is right.

Q. And that would include the character of the traffic, would it not?

A. Yes, sir.

[fol. 2728] Q. You would also want to know the traffic that is to be picked up or set out enroute, would you not?

A. That is right.

Q. That is over the division that is under your supervision?

A. That is right.

Q. Of course you would want to know the operating characteristics of the power that is to be used, that is, its tonnage rating on your particular division?

A. That is right.

Q. And its possibilities of speed, that would be an element in the dispatching of your trains, that is, the time element?

A. Yes, the time element.

Q. And the tonnage, of course, that is being moved, that is another thing that would be necessary to know in the dispatching of your trains?

A. That is correct.

Mr. Strouss: That is all for now.

Mr. Mason: Do you wish Mr. Baker to remain at Tucson to be called further for cross-examination?

Mr. Strouss: Yes, I haven't gone into the matters he testified to the other day. The questions I asked now, I [fol. 2729] took it that the examination of Mr. Baker today has been more or less preliminary to a reoffering of exhibit No. 198 for identification.

Mr. Mason: Yes, it has been preliminary to that, but it has been for the purpose of laying the foundation for the entire redispatching study.

Mr. Strouss: If you desire Mr. Baker to leave, I will check over his previous testimony this evening and try to release him tomorrow morning.

Mr. Mason: All right, thank you very much.

The Court: Call the next witness.

[fol. 2730] Mr. Mason: We will call Mr. Herrell.

L. D. Herrell was called as a witness on behalf of the defendant and, being first duly sworn, testified as follows:

Direct examination.

By Mr. Mason:

Q. Will you please state your name and residence to the reporter, Mr. Herrell?

A. L. D. Herrell, El Paso, Texas.

Q. What is your position with the Southern Pacific Company?

A. Chief Train Dispatcher, Rio Grande Division.

Q. How long have you occupied that position, Mr. Herrell?

A. Since February 1, 1937.

Q. What was your previous experience in railroad service?

A. I began with the Louisville and Nashville on the S. & N. A. Division, the headquarters of which are at Birmingham, Alabama, in 1908 as a telegrapher. In June, 1913, I

was promoted to train dispatcher and remained in that position with the L. & N. until January, 1925, at which time, on account of reduction in force I was again reduced to [fol. 2731] the rank of telegrapher, of extra telegrapher, I may say and worked very little until I came with the Southern Pacific on the 5th day of October, 1915, on the Tucson division as telegrapher, and in May, 1916, was promoted to dispatcher, working at El Paso and Tucson, until October of the same year, at which time I was transferred to the Arizona Eastern at Globe and remained in Globe until November 24, 1924, at which time we were absorbed by the Southern Pacific along with the Southern.

Q. You mean the El Paso and Southwestern?

A. Yes, along with the El Paso and Southwestern. I worked as train dispatcher at El Paso from 1924 until about 1931, when I assumed what we call the first relief position. On that position, I worked three days per week as trick dispatcher, one day per week as chief dispatcher, and two days per week as assistant chief dispatcher, until I was given the chief dispatcher's job on February 1, 1937.

Q. Mr. Herrell, you heard the testimony of Mr. Sines, did you, as to the redispatching study undertaken in 1939 with respect to 1938 traffic?

A. I did.

Q. Are you the L. D. Herrell mentioned by Mr. Sines in [fol. 2732] his testimony as having participated in that study?

A. I am.

Q. How far did your jurisdiction as chief dispatcher extend in 1938?

A. Extends from Tucumcari, New Mexico, to Lordsburg, New Mexico, and from El Paso, Texas to Tucson, Arizona, on the line via Douglas, that is, the dispatchers working under my jurisdiction handle the westbound main track from Mescal to Tucson.

Q. And do you handle all train operations east of Mescal on the south line?

A. I do.

Q. And on the north line your jurisdiction extends westward from El Paso to Lordsburg?

A. Correct.

Q. Now, in the 1938 redispatching study, Mr. Herrell, where did you start the operation of the redispatched westward trains?

A. From El Paso.

Q. And so far as you were concerned, where was the redispatching of the eastward trains commenced?

A. From Lordsburg.

Q. From whom did you receive the traffic at Lordsburg?

[fol. 2733] A. The chief dispatcher of the Tucson division, Mr. Baker, at that time.

Q. In actual practice, Mr. Herrell, do you receive any advance information from the Tucson division or divisions further west as to the trains which will reach you thereafter?

A. I get my information from the chief dispatcher at Tucson. I also receive a consist of each freight train from Yuma very soon after its departure from that point.

Q. Is that sent to you by telegraph?

A. Teletype, which is used in place of telegraph, replacing it.

Q. Now, what information is shown on the consists that are teletyped to you from Yuma?

A. The train identification number, that is, the block number, also the perishable and manifest loads for the Rock Island, perishable and manifest loads for the T. & N. O., perishable and manifest loads for the Texas and Pacific, also any cars that might be routed via the Santa Fe from either Tucumcari or El Paso, and usually includes the short loads; in fact, the consist shows the destination of all cars on the train out of Yuma.

Q. You speak of short loads. Just what do you mean by that?

[fol. 2734] A. Well, cars for Tucson, for Douglas, Bowie, or any other intermediate points.

Q. Will it also show cars for intermediate points on your own division, such as Deming or Alamagordo?

A. Yes, it will. However, they are very few.

Q. Does your consist also show cars destined for interchange with the Mexican Railroad at El Paso?

A. They do not.

Q. They don't show that?

A. They do not. Now, I say they do not, I don't believe I have any recollection of ever having seen one for the Mexico and Northwestern or any of those lines, especially

on the freight trains. Now, we do on the passenger trains, we get that information. However, the consist would probably show the destination as El Paso, but by other means I have obtained the information as to where the car is going.

Q. In actual practice, do you use this lineup for any purpose in arranging your trains out of Lordsburg?

A. I do.

Q. We have a line-up form which we use in El Paso when we receive these consists from Yuma. The first column [fol. 2735] will show how many cars east of Tucson on this particular train. Then we show the loads for the Rock Island, two columns, we have a separate column for perishable and one for manifest; in the same manner for the T. & P. and in the same manner for El Paso, because El Paso is quite a diversion point and some shipper may bill in one block 15 or 20 cars of perishables to El Paso for diversion, and on the Yuma consist, the destination of those perishables will be shown as El Paso. However, from experience I know that that is not the final destination of that perishable. We may pick up practically all of it via the Rock Island.

Q. You say that you make a line-up in accordance with this form?

A. We do.

Q. Do you actually determine the number of trains you are going to operate as a result of the information thus given to you?

A. As nearly as possible. That is the only information that we have, say 24 hours in advance as to how many trains it is going to be necessary for us to operate out of El Paso via Tucumcari.

Q. Does this information tell you how many trains you [fol. 2736] are going to operate out of Lordsburg to El Paso?

A. Ordinarily, yes, sir.

Q. How much in advance of the arrival of the traffic at Lordsburg does the information reach you?

A. Well, we consider the average run from Yuma to Lordsburg as 20 to 22 hours, therefore, I usually have the information, I would say, 19 or 20 hours in advance of the arrival of the train at Lordsburg.

Q. Do you plan the train movements out of Lordsburg as long as 19 or 20 hours in advance of actual movement?

A. I do.

Q. Why do you have to do that?

A. It is necessary that I have that information in order to get the necessary amount of power and crews at Lordsburg to protect the eastward perishable trains, as they must be on hand before the arrival of the trains, the crews rested ready to go to work.

Q. You say you must place the power and the crews at Lordsburg?

A. I must have the information in order to get them at Lordsburg from El Paso.

Q. And why do you have to move the men and locomo- [fol. 2737] tives to Lordsburg?

A. El Paso is our home terminal, Lordsburg is the away-from-home terminal, we don't have any surplus power or crews at Lordsburg in the ordinary run of operations.

Q. Does the information that you receive from the west have any influence on the number of trains you will operate westward from El Paso toward Lordsburg?

A. Yes, at times it is a controlling factor.

Q. Why is that?

A. Well, because we may not have enough westbound business to operate enough units with full tonnage or full crew limit as we use it over there. Now, we are running 100-car trains on most of our drags, so if I am out of balance at Lordsburg and need to get another engine and crew at that point, then I have to have at least two hours to get the train started from El Paso, and approximately seven or eight hours for the run, and then the crew must have more than eight hours off duty before they can be called back to work.

Q. By the way, Mr. Herrell, were you present when Mr. Baker described the scope of the duties of the chief dispatcher and the trick dispatcher?

A. I was.

[fol. 2738] Q. And did you hear his testimony in that regard?

A. I did.

Q. Does the scope of the duties performed by you as chief dispatcher and of your trick dispatchers correspond to what Mr. Baker stated?

A. Yes, with some variations. I have connecting lines at El Paso that I have to give the necessary information to the same as I would if it were a connecting division.

Q. Do you receive information from connecting lines as to prospective arrivals at El Paso as well?

A. I do also from the Rock Island at Tucumcari.

Q. Now, in the redispatching study, Mr. Herrell, did you receive advance information from the chief dispatcher of the Tucson division as to the trains which would be operated into Lordsburg in the redispatched operation?

A. I did.

Q. How was that information conveyed to you?

A. Well, we were working there in the same room together and we worked just like we would if we were on our normal positions. When he started his trains out of Yuma, why, that gave me the advance information as to when they [fol. 2739] would reach Lordsburg and about what their consist would be.

Q. Was the information as to these trains leaving Yuma passed to you as the Rio Grande division chief train dispatcher?

A. It was.

Q. In the westward operation, do you give advance information to the Tucson division as to trains which are to reach Lordsburg in the near future?

A. I do.

Q. Do you give him that information before the trains leave El Paso?

A. I do.

Q. Just how do you do that?

A. By line-ups; We make at least three line-ups daily, every eight hours, to the chief dispatchers and others concerned at Tucson, giving them as nearly as possible at the time the line-up is made out how many trains, especially the manifest trains, we will deliver them at Lordsburg the next day. This is given, our first line-up is given 22 to 24 hours in advance, and we have telephone connections that we use to confer with each other several times daily, that is, during the entire 24-hour period we are [fol. 2740] in communication with each other any time it is necessary.

Q. Now, you base these line-ups on information reaching you from your eastward connections?

A. That is correct.

Q. Do you receive information in advance of actual arrival of trains from the Rock Island, for example?

A. We do, we receive a line-up from the chief dispatcher of the Rock Island at Dalhart as to what time the G. B. W. will reach Tucumcari the following day. However, that consist doesn't show the loads, as we practically always operate only one train west with manifests from Tucumcari, especially since we have the larger power.

Q. Now, do you receive a line-up for consists from Tucumcari as to trains operating westward from that point to El Paso?

A. I do.

Q. Is that sent you by teletype?

A. It is.

[fol. 2741] Q. Do you receive advance information from the dispatcher of the Texas and New Orleans as to traffic which will be delivered at El Paso?

A. I do.

Q. How is that received?

A. By a line-up which is passed from his desk to mine, as we are both located in the same office.

Q. Do you receive similar information from the Texas and Pacific?

A. I do, I receive a consist of the Texas and Pacific manifest train soon after it leaves Fort Worth.

Q. Did you in the redispatching study communicate advance information of trains to be operated out of El Paso on the redispatched train sheets?

A. I did.

Q. To the dispatcher of the Tucson division?

A. I did.

Q. How did you give that information to him?

A. Usually our operation in the redispatch was as to our manifest trains, the same as it was in actual practice.

Q. You mean as to times of departure?

A. Times of departure. The only difference that we made in those trains was that we filled them with empties.

[fol. 2742] Q. Up to what number of cars?

A. Usually 85 or 90. I tried to stay within the tonnage ratio of the larger power the same as I do with the present power. In other words, we tried to build the trains at El Paso so they would not have to be touched at Lordsburg and there would be nothing except change engines and caboose.

Q. In eastward operations from Lordsburg to El Paso of the redispatched trains, did you observe any particular maximum train length for the purpose of redispatch study?

A. As a usual thing I handled the trains as they were delivered to me by the Tucson division.

Q. Was it necessary to make changes of consist at Lordsburg?

A. Sometimes they have short cars for Lordsburg or Clifton where it is necessary that the cars be cut out. There are at times a few cars to be picked up at Lordsburg, and we picked them up.

Q. Apart from those instances, were there any other changes necessarily made in the redispatched trains as received from the Tucson division?

A. Not necessarily.

Q. Were these instances of short cars to be set out or picked up at Lordsburg frequent or comparatively rare?

[fol. 2743] A. Well, it is a daily occurrence.

Q. Are there very many such cars?

A. Not very many.

Q. You spoke of having operated some 100-car trains westward from El Paso to Lordsburg. Do you do that at the present time irrespective of the redispatching operation?

A. We have for the sixteen years I have been in El Paso.

Q. Are those trains always built up to 100 cars at El Paso or are they sometimes built up to that length at a point a short distance west of El Paso?

A. No, we can build up a train to 100 cars at El Paso, but on the redispatch in order to handle 125 cars on our westbound drags which included mostly empties it was necessary to build 100-car trains at El Paso, or, rather, when we accumulated more than two or three hundred empties I would run a short turn-around service, as we call it, from El Paso to Strauss, which is approximately 18 or 19 miles west of El Paso, and at which we have trackage to hold more than two hundred cars without blocking the siding and we would set these cars out at that point. Then, when we operated our 100-car drags west from El Paso, we would have them pick up whatever we wanted [fol. 2744] them to at Strauss by instructing the conductor, usually not more than 125 cars out of Strauss.

Q. So the train would be 125 cars from Strauss to Lordsburg?

A. That is correct.

Q. And one hundred out of El Paso?

A. One hundred out of El Paso.

Q. This method was used in redispatch operation, was it?

A. It was.

Q. Do you ever use a similar method in actual operation?

A. Not for that same purpose. We do, when we get blocked at times, have stored cars at Strauss on numerous occasions.

Q. Do I understand that this filling at Strauss was only westbound drags consisting principally or entirely of empties?

A. I believe there are probably two or three occasions where I had a manifest train pick up a few cars at Strauss, in order to fill, as they were light out of El Paso. That was a rare occasion.

Q. Other than those occasions, the picking up was confined to the drags or empties?

A. The drags, and the train which we operate out of El Paso each night known as the "north line merchandise." [fol. 2745] It is the merchandise cars from the El Paso house or Deming, Lordsburg, and Clifton, and points on the Globe branch.

The Court: Mr. Herrell, with these actual operations you would build up a surplus of cars at Lordsburg of your empties, would you not? Where you were taking trains out of El Paso in excess of 70 cars, say, 100-car trains of those empties, you run those to Lordsburg and then you are confronted with the Arizona law so you would have to whittle that train down to the requisite number of cars, wouldn't you?

A. That is correct. Every two drags I run in there, he has to run about three out.

Mr. Mason:

Q. I think you should make it clear that the problem of cutting down the cars at Lordsburg is the problem of the Tucson division.

A. That is right; when I deliver the train to him at Lordsburg, I am through with it.

Q. It becomes Mr. Baker's or Mr. Cassady's problem?

A. It becomes the problem of the Tucson chief dispatcher. Lots of times we get them too full over there and have to

cut them down to 70 cars at Deming. In other words, we have to handle those same cars twice and later on I have [fol. 2746] to let some train out of El Paso light enough to pick up those cars which I have reduced at Deming. That also causes us, at times when the flow of refrigerators arrive El Paso faster than the Tucson division can handle them and we can't handle them in the El Paso yard, to run two hundred of them out to Strauss and store them out there until the flow has equalized itself enough to where the Tucson division can move them out of Lordsburg, which will give me room to move them into Lordsburg.

The Court: One other question, I take it from the testimony given by you and Mr. Baker that there is only one chief dispatcher in each division?

A. That is correct.

The Court: However, there must be a dispatcher on duty twenty four hours out of each day?

A. Those are assistant chief dispatchers. I have two assistant chief dispatchers, one comes on at four o'clock and works until midnight; another comes on at midnight and works until eight A. M. until relieved by me.

The Court: These assistant train dispatchers are in addition to the so-called "trick" dispatchers?

A. Yes, sir.

[fol. 2747] The Court: In other words, there are two dispatchers on duty at all times, either yourself as chief or one of your assistants and a trick dispatcher?

A. That is correct, one or more trick dispatchers.

Mr. Mason:

Q. How many trick dispatchers do you have altogether in the headquarters of the Rio Grande division at El Paso?

A. I have six trick dispatchers and one relief dispatcher, who works six days per week and another relief dispatcher who works three days per week, two assistant chief dispatchers and myself. Ten permanent positions and one which is termed an extra position because it is only three days per week.

Q. Out of those ten people, how many as a minimum are on duty in the dispatcher's office at any one time?

A. Three.

Q. In actual operation you receive the eastbound perishable trains at Lordsburg from the Tucson division in units of not more than 70 cars, do you?

A. That is correct.

Q. Do you build those eastbound perishable trains up [fol. 2748] to greater lengths at Lordsburg?

A. We do.

Q. How frequently do you do that?

A. I would say just as often as we can, that is one of our main duties.

Q. How often can you do it?

A. It depends upon the schedule, Mr. Mason, whether or not I can do that and arrive El Paso, maintain schedule with that train, but I would say one of the main features of that is whether or not I am long or short of crews and power at Lordsburg. Sometimes I will take that chance of making a consolidation of three trains into two at Lordsburg and not have a unit of protection over there for each train and we get away with it in nice shape. Sometimes we might do that and not do so well.

Q. Do you ever have to operate trains in units of 70 cars or less straight through Lordsburg to El Paso in order to make schedule?

A. That is our most frequent operation.

Q. Is that more frequent than the consolidation?

A. Oh, absolutely.

Q. How much more frequent according to your experience?

A. I would say 75 per cent of the trains operated eastward out of Lordsburg are 70 cars or less.

[fol. 2749] Q. Are they substantially the same trains that are delivered to you by the Tucson division at Lordsburg?

A. They are.

Q. What is it that causes your inability or failure to hold them for consolidation at Lordsburg?

A. The fact that they are not arriving close together or not in good enough shape as to time for consolidation or it may be that I have a surplus of crews and power at Lordsburg which it is necessary to return to El Paso. There are many controlling factors.

Q. Did you in the redispatch operation undertake any consolidation of eastbound trains at Lordsburg for the purpose of running longer trains on the Rio Grande division

than the redispatched trains that were run on the Tucson division?

A. As I remember it, the opportunity for consolidation at Lordsburg was very rare.

Q. Did you yourself make any of the entries upon the redispatch train sheets covering redispatch operations on the Rio Grande division?

A. I made them all, I had no assistance. I did all the work myself.

Q. Did you yourself actually operate the trains between [fol. 2750] El Paso and Lordsburg?

A. I did.

Q. Did you make the entries as to times at intermediate points?

A. I did. I did the work of a trick dispatcher as well as chief dispatcher.

The Court: Mr. Herrell, who is the immediate superior of the chief dispatcher?

A. He reports only to the superintendent.

The Court: You mean the superintendent of the division?

A. Superintendent of the division, yes, sir.

Mr. Mason:

Q. Mr. Herrell, did you plan and calculate all of the meets and passes of the redispatched trains?

A. I did.

Q. And worked out the points at which such meets and passes would take place?

A. That is correct.

Q. Did you undertake to match up your redispatched trains with actual trains?

A. I did.

Q. For what purposes?

A. Because we had to match the runs. I was instructed to handle the redispatch the same as I would in actual practice and that is what I tried to do.

[fol. 2751] Q. Could you match the run of a redispatched train with tonnage rating or a definite percentage of tonnage rating with the run of an actual train having tonnage rating or an equivalent definite percentage of tonnage rating?

A. I did.

Q. Was that done on each day?

A. On each day.

Q. Were you present in the courtroom when Mr. Sines testified as to the general method laid down for the conduct of the redispatching study?

A. I was.

Q. Will you say whether or not you participated in the conferences described by Mr. Sines preliminary to the actual redispatching work?

A. I did, not in all of them but in some of them.

The Court: All of them affecting your division?

A. As I remember, your Honor, we were called to San Francisco for a conference preliminary or prior to beginning this work and that is the conference to which I am referring. Then when we actually went to Los Angeles to begin the work, we had several conferences as to the [fol. 2752] methods we would use, which were naturally being something new to us, we had to come to some agreement so we would be in accord with our connecting divisions.

Mr. Mason:

Q. I think the Court asked you if you participated particularly in all the conferences relating to the handling of the redispatch operation on your division?

A. I did.

Q. Did you in your conduct of the redispatching study, referring particularly to the 1938 study for the Rio Grande division, follow the same principles and practices which were outlined and described in Mr. Sines' testimony?

A. I did. There may be some slight variations.

Q. What would those variations relate to?

A. As well as I remember Mr. Sines stated in the run of these redispatched trains a differential of 10 per cent or less was disregarded.

Q. You mean a differential of 10 per cent or less in relation to the tonnage to engine rating?

A. Yes, and I broke mine at 10 percent. In other words, if a redispatched train had 90 per cent and the actual train had 80 per cent, then I allowed the redispatched train five minutes longer to make the run from Lordsburg to Wilna and two mintues longer from Myndus to Aden.

[fol. 2753] Q. Suppose the differential was the other way, expressed in ratio of tonnage to rating, the redispatched trains were 10 per cent or more lighter than the actual trains, did you make the same differential in time in favor of the redispatched trains?

A. I did.

Q. Did you make other differentials at other points along the line?

A. I did not use any differential on the westward trains out of El Paso because there were not enough of those trains operated where the differential was more than 10 per cent. The usual rating or the usual loading of our manifest trains was two or three or four per cent lighter than they had upon the actual operation.

Q. That is your redispatch manifest trains expressed in ratio of tonnage to engine rating were two to three to four per cent lighter than the actual trains?

A. That is correct, generally speaking. I made no difference in the running time of the westward trains. I might correct that by saying as a usual thing it was not much over that amount of difference. It might have been heavier or it might have been lighter, but as a usual thing the load-[fol. 2754] ing was about what we are attaining at present.

Q. Have you seen a copy of Mr. Sines' exhibit No. 197 showing present and proposed siding capacities?

A. I have.

Q. Did you participate in the conferences at which the siding extensions for the purpose of the redispatching study were determined upon?

A. I did.

Q. Will you look at exhibit No. 197, I take it you have examined it before?

A. I have.

Q. Will you say whether or not having particular reference to the district between Lordsburg and El Paso on the Rio Grande division the siding extensions and increases in sidings there shown are necessary for the purpose of permitting the operation of trains of the lengths contemplated by the redispatching study of 1938?

A. They are.

Q. Does the showing there represent your own best judgment as to the extensions which would be required or were required for that purpose?

A. Yes, sir.

The Court: In other words, you would only have to increase your siding capacity on eight stations between El [fol. 2755] Paso and Lordsburg?

A. That is correct.

The Court: We will take our mid-afternoon recess at this time.

(Thereupon a short recess was taken, after which proceedings were resumed as follows.)

[fol. 2756] The Court: You may proceed.

Mr. Mason: Mr. Herrell, you heard the reference by Mr. Sines to redispatching studies undertaken involving the year 1940?

A. I did.

Q. Did you participate in any such studies?

A. I did.

Q. Did you perform the same character of work in connection with those studies as in connection with the 1938 studies?

A. I did.

Q. In the same manner?

A. I did.

Q. Now, referring first to the 1940 study, in which the long trains actually operated were redispatched as short trains, did you prepare redispatch train sheets?

A. Yes, sir.

Q. Receiving the traffic at Lordsburg in the same manner?

A. Yes, sir.

Q. And handling the traffic over the Tucson division at Lordsburg in the same manner?

A. Yes, sir.

The Court: May I ask if during the month of April, 1940, when these long train operations through Arizona [fol. 2757] were actually being made by the defendant here, if that covered the entire lines of the Southern Pacific across the state or if it was merely from Tucson west? I am merely asking that of counsel.

Mr. Mason: It covered the entire territory. I think it also included some operations on the South line, although I was about to ask the witness.

Q. Did the redispatching study, Item No. 5, of Mr. Sines' exhibit No. 196, relate also to operations on the south line?

A. I don't believe it did as to freight trains, Mr. Mason, for the simple reason that during April, 1940, we were handling slag in large quantities, and that is a very heavy product. I didn't have much opportunity to fill the trains beyond 70 cars. Now, I may not be exactly correct in that statement, but that is, as I remember it at the present time.

Q. Do you recall whether in April, 1940, there was any operation of trains in excess of 70 cars on that part of the Rio Grande division within Arizona?

A. Yes, there were some.

Q. And to the extent that such trains were operated they were redispatched to 70-car maximum?

A. They were.

[fol. 2758] Q. You participated in that study?

A. I did.

Q. In the same manner that you have described for the 1938 study?

A. Yes, sir.

Q. When you had completed the redispatched train sheets, Mr. Herrell, which I understand were all your own personal work——

A. That is correct.

Q. —what did you do with them?

A. I left them in San Francisco.

Q. Did you leave them with any particular person?

A. Mr. Sines.

Q. You delivered them to Mr. Sines?

A. I did.

Q. Does that apply to all of the studies that you have participated in?

A. That is correct.

Q. Now, did you participate in the redispatching study for 1940 which is mentioned at Item 6 on Exhibit 196, the redispatching of the trains into still longer trains with the use of A. C. power and extended sidings?

A. I did.

Q. And in the same manner as you have described for [fol. 2759] the 1938 study?

A. Yes, sir.

Q. Were the entries made by you in the redispatch train sheets checked with or by anyone else to determine whether

the operation had been conducted in accordance with the principles established for the redispatching study?

A. No, I believe I was wholly responsible for that. At times it was probably necessary to confer with Mr. Sines. If so, I did.

Q. Did you check them over yourself to be certain that you had followed the proper principles and all of the other conditions contemplated?

A. I did.

Q. Can you say whether or not you followed those principles and complied with the conditions contemplated for the redispatching study?

A. To the best of my ability and knowledge I did.

Q. I think I have overlooked also the passenger redispatching studies, Items 2 and 3. Mr. Herrell, you heard those mentioned by Mr. Sines, referred to in his testimony in connection with his Exhibit 196?

A. I did.

Q. Did you participate in those studies?

[fol. 2760] A. Yes, sir.

Q. Did you make entries on redispatch train sheets for that purpose; for the purpose of the passenger redispatching studies?

A. No, sir, they were not made on what we call train sheets, they were on, I believe, another form was used for that, a white sheet.

Q. You made the redispatch entries directly on the white sheet, did you?

A. I won't say that I made all of them.

Q. Well, in so far as the Rio Grande division is concerned, did your either make them or supervise their making?

A. I did.

Q. Did you make any check of the entries which were made by any other person?

A. Yes, sir.

Q. What other person made them, another dispatcher working under your supervision?

A. Another dispatcher.

Q. Will you say whether or not the entries made in so far as they relate to the Rio Grande division which form the passenger redispatching study of 1938 represent your own best judgment?

A. They do.

Q. Did you participate in the analysis of passenger oper-
[fol. 2761] ations, Item No. 3, on Mr. Sines' exhibit 196?

A. May I see that, please? Yes, sir.

Q. And in so far as that analysis relates to the Rio Grande division or points on the Rio Grande division, what does it represent as to your own efforts?

A. The same as I would have done it had I actually done the work, as it was under my supervision.

Q. Does it represent your own conclusions gained from an examination of the train sheets and other documents?

A. It does.

Q. Had there been supplied to you a statement showing the rating of A. C.-8 locomotives, over the Rio Grande division, or over those portions of the division which are involved in the redispatching study?

A. I had it, yes, sir.

Q. Generally speaking, what was the rating of AC-8 locomotives in tons or by percentage, as compared to the F-4 type locomotive?

A. Approximately 150 per cent of the F-4 type. The rating of the AC-8 between Lordsburg and El Paso is 12,000 M's.

[fol. 2762] Q. 12,000 M's of 1000 pounds each?

A. Yes, sir.

Q. How does the rating of the AC-8 locomotive compare with the rating of the S. P.-type locomotive of the 5000 numeral series?

A. The rating of the 5000 series is 8,850 M's between Lordsburg and El Paso, which would make the AC-8 approximately 135 per cent greater.

Q. Did you work with those ratings, with that rating of the AC-8 locomotive in the redispatching studies in which those locomotives were employed?

A. I did.

Q. Mr. Herrell, I show you a bound volume of documents and ask you to state for the record what that bound volume is?

A. This is the Rio Grande Division train sheets for the month of June, 1938, of actual operations.

Q. Now, does that include the district between El Paso and Lordsburg?

A. It does; this is it here.

Q. Are there a separate group of the train sheets?

A. Yes, sir.

Q. As well as the district between Tucson and Douglas and Tucumcari and El Paso?

A. Between Tucson and El Paso via Douglas, and El [fol. 2763] Paso to Tucumcari, and El Paso to Lordsburg.

Q. If I understand correctly, the El Paso to Lordsburg sheets were the ones you particularly used in the redispatching study covering 1938, the month of June?

A. That is correct, also the train sheets from Tucson to El Paso via Douglas.

Q. For what purpose, with respect to the movement?

A. In June, 1938, we handled long trains on the south line, we moved some refrigerators via the south line which were in actual practice moved over the north line.

Q. So that you operated redispatched trains over both lines in excess of seventy cars?

A. In June, 1938, we did.

Mr. Mason: Your Honor, we now tender and I ask the record to show the tender of actual train sheets for the Rio Grande division for the month of June, 1938, for the examination and use of opposing counsel for the purpose of cross-examining the witness.

Q. Now, I wish you would select, if you will, the redispatch train sheets for the Rio Grande division covering the month of June, 1938, concerning which you have previously testified.

[fol. 2764] A. These train sheets are for the district Lordsburg to El Paso for the month of June, 1938.

Q. Do you also have the redispatch train sheets for the district Tucson to El Paso via Douglas for the same month?

A. They are here.

Mr. Mason: Your Honor, we now tender to opposing counsel, and I ask that the record show the tender of the redispatch train sheets for the Rio Grande division for the month of June, 1938, for the two districts mentioned. Now, do you have before you a volume containing the Rio Grande division train sheets for actual operations for the month of August, 1938?

A. I have.

Mr. Mason: Will you hand that to Mr. Strouss, please? May the record show the tender of the August, 1938, train sheets as well covering the actual operation?

Q. Do you have also here before you, Mr. Herrell, the redispatch train sheets for the Rio Grande division covering the month of August, 1938?

A. I have.

Q. Now, are those the redispatch train sheets concerning which you have previously testified?

[fol. 2765] A. They are.

Mr. Mason: Will you please hand those likewise to Mr. Strouss, and may the record show that these redispatch train sheets for August, 1938, are likewise tendered at this time.

Mr. Strouss: Of course, these records don't show the traffic available at the point of origin of the train.

Mr. Mason: The showing of the traffic available will be made, it will be supplied for the record.

Mr. Strouss: I want to say this to the Court now, I don't think it is incumbent upon me to have loaded on me a bunch of records if that is not available. I think if Exhibit 198 is to be at any time admissible, I doubt if it can be; but there is one further objection I want to make, that it assumes facts not in evidence. As Mr. Baker has testified that, of course, in dispatching trains it is necessary to know the traffic available, when it arrived, and the character of that traffic, and for opinion evidence to be given upon a set of facts or an experiment that has not been made, but the opinion as to what the result of that experiment would be if made, certainly all of the facts that are necessary to be [fol. 2766] known with respect to that must be put in evidence, including here the traffic available and when it became available, the tonnage, the tonnage in the trains actually operated and the tonnage in the trains under the assumed or redispatched operation. Now, I don't think that that is work that they can put on to me to dig out. That is a matter that is necessary for the admissibility of their evidence.

Mr. Mason: Of course, we put this information in the record by witnesses who are competent to put it in, not necessarily all at once. We have developed by the last two witnesses their part in the redispatching operation.

The Court: There is nothing before the Court now.

Mr. Strouss: Of course, I am making the further objection, and I have prefaced it by advising counsel what the purpose of that objection is.

Mr. Mason: We are glad to have the advice that the statement as to the traffic available will be demanded. I think, as a matter of fact, we undertook several months ago to furnish that information to opposing counsel.

Mr. Strouss: I don't think that I asked for that. As I say now, I don't think that that is a matter for me to dig out. As the Court has said, that is not before us at the [fol. 2767] present time.

The Court: You may proceed.

Mr. Mason: I would like to have you state, Mr. Strouss, just what you mean when you use the term "traffic available," what sort of showing you are going to demand to be made.

Mr. Strouss: I am not going to be unreasonable. I know that it takes a great deal of records but, at least, as to the typical days here I think there should be a showing. No doubt you have the traffic that is in these trains, take the eastbound movement here under redispatched operations, you have, of course, you know what your traffic is, that is, in those trains. Now, your records will show when that traffic became available at Yuma, what the character of it is, the tonnage in the train, when it arrived there. That is the information I want.

Mr. Mason: All that appears on the actual train sheets, doesn't it?

Mr. Strouss: I don't think it does on your Tucson division when it arrives at Yuma.

Mr. Mason: Mr. Strouss, what the redispatching study purports to show is the operation not of some more or some less traffic than was operated in the actual trains, but the same cars that were operated in the actual trains. Now, [fol. 2768] what point would it be to show that the actual trains left behind a half dozen cars at Yuma which were not handled in the redispatched train. Suppose there were half a dozen cars left behind on a particular day? Would that have any effect on the redispatching? How could it?

Mr. Strouss: It might have some effect on whether that was a proper redispatching or not. Mr. Baker has testified that the time of arrival of traffic has a great deal to do with the redispatching of it.

Mr. Mason: Mr. Baker also testified that the redispatched trains left Yuma at practically the same times as the actual trains with which they were matched. Now, that gives

the actual trains a break, a break against the defendant and in favor of the State, if you like.

Mr. Strouss: There is a part of that train that didn't, because if it is a longer train, then actually part of it didn't leave at the same time the actual did.

Mr. Mason: Then, it is leaving ahead, isn't it?

Mr. Strouss: Well, I don't know. That is what I want to find out. I don't think to take a few typical days in this [fol. 2769] operation certainly wouldn't be any great burden.

Mr. Mason: Well, if I understand what you mean by "traffic available" you mean the number of cars, for example, at Yuma on the day the redispatching study started and the number of cars——

Mr. Strouss: And when it arrived there.

Mr. Mason: ——that were available to move and when it arrived there. Do you want that information yourself, or do you think it should be made of record here?

Mr. Strouss: I think as a matter of admissibility of your exhibit that it certainly should be made of record to make that exhibit admissible, if it can be made admissible. I don't mean to say that it would make it admissible, but that is one of the factors that certainly would have to be shown before it is admissible.

The Court: Let me get it clear. Do the records which you now tender to counsel showing the actual operations give the information that you think should be available on this assumed operation?

Mr. Strouss: No.

The Court: In other words, what you are objecting to is that the availability of traffic——

[fol. 2770] Mr. Strouss: This is the operation of the trains assuming that the traffic was there to so operate.

Mr. Mason: It just seems to me that Mr. Strouss doesn't understand at all what a redispatching study is. A redispatching study, as the witnesses have testified, is the movement of the same cars which moved in the actual trains by means of redispatched trains. Now, of course, if the traffic was there and moved in actual trains, it must have been available to move in redispatched trains. That seems so obvious that it doesn't seem to me worth discussing any more. That is the traffic that was there available. If more traffic was there that might have moved in redispatched trains, we have given Mr. Strouss a break and weighted

the scales against ourselves by failing to move it in the redispatched trains, but we haven't moved more traffic in the redispatched trains than in the actual trains.

Mr. Strouss: Maybe I misstated it. I want to know when the traffic that is moved, of course, it would be the same traffic, that is the testimony at least, the same traffic that was moved by actual was to be moved by the redispatch, when that traffic came into Yuma or El Paso and became [fol. 2771] available; I would like to know whether there was any delays in the movement of any of this traffic by reason of this redispatch. There is no way of telling that by taking the trains as rebuilt without any information as to when those cars came in. Then I want to know the tonnage. That information probably is on the actual sheets, but whether it is on the——

The Court: Well, is it on the actual sheets?

Mr. Strouss: Yes, they show their tonnage on the actual. I don't know whether it is on the redistributed.

The Court: Well, this witness should be able to answer those questions.

Q. Mr. Herrell, is the actual tonnage shown on the sheets that depict the actual operations?

A. In most cases, or on the sheets which I worked there is at the top of the train sheet shown the percentage of engine loading on the actual train with which the run was compared, and the percentage of engine rating on the redispatched train over the same distance.

Mr. Mason: Is that a reflection of the tonnage, Mr. Herrell? Is the percentage of engine rating a reflection of the tonnage in the train?

A. It is, it is a percentage, the exact M's.

[fol. 2772] Mr. Strouss: You also show with each train the tonnage handled, don't you?

A. This is the actual tonnage, and here is the percentage of engine rating. In other words, this train actually had 57 per cent, and on the redispatch he had 44 per cent, he was 13 per cent lighter.

Q. This is one of your redispatch sheets?

A. This is one of the redispatch sheets.

Q. Is this figure here the tonnage of that train as redispatched?

A. That is right, 46 loads and 22 empties.

Q. The actual sheets which show the tonnage of the train actually run?

A. They would.

Q. That is what I mean.

A. Yes. This is not in all instances shown on the eastward trains or on the drags, because we just fill the drags to 125 cars and we usually run about 6,500 M's. You can figure, some estimate empty P. F. E.'s at 51 M's, some will estimate them at 52, and others at 53. I estimated them at 53 M's to the car for empty refrigerators.

Mr. Strouss: Now, I think that we should have the tonnage of all of these trains. That becomes important so [fol. 2773] far as the comparison of helper operation is concerned.

Mr. Mason: There are no helper districts on the Rio Grande division.

Mr. Strouss: I am speaking now of the operation from Yuma to El Paso, there are helper districts in Arizona.

Mr. Mason. We haven't yet tendered the Rio Grande train sheets.

The Court: You may proceed, gentlemen. I don't think there is anything before the Court to rule on.

Mr. Mason: I want to make this reference to yesterday's testimony, page 2625, and the preceding page, 2624. It was stated, in effect, that all of the redispatch and actual train sheets and all of the other basic documents covering the actual operations as well as the work sheets in connection with the redispatched operations would be made available to counsel. Now, in due course I shall identify through witnesses the basic documents showing the consists of trains arriving at Yuma and the time of their arrival, and the cars of the various types, perishable, manifest, empties, and so forth, which were in those trains, which furnished the basis, as Mr. Baker testified, with which he started [fol. 2774] his redispatching studies at Yuma.

The Court: If that showing is made, you may overcome the objection that Mr. Strouss is now raising.

Mr. Mason: I hadn't intended to make a showing in the record because primarily the redispatching study is the transportation of the same cars.

The Court: I think the Court understands that and I am sure Mr. Strouss does.

Mr. Mason: It is not an attempt to get more traffic over the road at the time, but only to handle the traffic which was actually handled, and with that understanding, the necessity for the times of arrival at Yuma and so forth, it seems to me, disappears because the study doesn't attempt to eliminate or to treat with the times which might have been taken in Yuma as between the arrival of trains from Colton and the departure of such trains from Yuma, except as that feature may be involved in the reconsisting operations of Los Angeles Division trains at Yuma to fit them to Tucson division requirements.

[fol. 2775] Mr. Strouss: Let me suggest this, in order that we might not burden the Court with too much of our troubles at the present time. Suppose you give me the information which I have indicated I want and after recess I can give you some typical days and let me look it over and let me determine whether it is necessary to put it in the record. I haven't any desire to load this record with a lot of unnecessary information.

Mr. Mason: I am perfectly willing to hand these to counsel right now only I wish to identify them. I will give the entire file to Mr. Strouss and let him select the typical days. Perhaps Mr. Sines better identify these, he knows exactly what they are.

B. S. Sixes was recalled as a witness in behalf of the defendant and testified further as follows:

Direct examination (continued).

By Mr. Mason:

Q. Mr. Sines, will you state the character of the documents showing the trains into Yuma and into other division points where trains are made up, which are to be furnished to Mr. Strouss at this time?

[fol. 2776] A. If Mr. Strouss wants them he can have the forms 1216, which are the conductors' wheel reports of the Los Angeles division on the trains entering Yuma. As I explained yesterday, however, we recapped those conductors' wheel reports into recap sheets for the use of Mr. Baker. Those sheets we intend to give to Mr. Strouss. Those sheets show the identification of the train and the

arrival at Yuma and the train split up into perishable cars, merchandise, and manifest Phoenix loads, Tucson and south line shorts, and Bowie shorts—the information that Mr. Baker or the Tucson division chief dispatcher ordinarily has to have when he is casting up his day's business in advance. When Mr. Baker got those trains started out of Yuma, thereafter there wasn't any necessity for further analysis of the conductors' wheel reports except to ascertain the pick-ups and the set-outs as they occurred in actual operation along the road. We made a further analysis of the conductors' wheel reports to determine those and have set them down on these sheets and we intend to give that to Mr. Strouss. We were going to give him the forms 1216 for the whole trip from Yuma to El Paso, if he wanted them, we just didn't get around to it until thirty minutes [fol. 2777] ago.

Q. Do you have those recapitulations, forms 1216, entering Yuma and also at other points?

A. Some of them I have here in the courtroom. I have everything over in the office and all you have to do is ask for it.

Mr. Strouss: I will take this summary you are talking about.

Mr. Mason: The one which we have now and which I am handing counsel covers as I view it the month of August, 1938, which is one of the two months covered by the redispatching study.

Q. Do we have here also the recapitulations for June?

A. Yes, sir, these smaller files are the set-outs and pick-ups enroute.

Q. The documents I have handed to Mr. Strouss are the recapitulation sheets covering not only Yuma but other division terminals as well?

A. In addition to that, there is also a statement I have in my file, I haven't got it here, but it is here in Tucson, showing the business on hand at Yuma as of 12:01 A. M. at the beginning of June and the beginning of August when we said, "Let's start this redispatch."

The Court: The business accumulating from day to day [fol. 2778] thereafter?

A. No, the business that was there at that particular moment when Mr. Baker started his 30-day redispatch. A

few cars that happened to be on hand in the Yuma yard and which had to be accounted for along with thousands of other cars that came in from day to day as the trains were redispatched.

Mr. Strouss: That is a small number?

A. Very small.

Mr. Mason:

Q. I take it that all the other cars that came in and were moved out are shown on the train sheets?

A. Yes, they are on the train sheets, but we went to the extra trouble and effort to recap every train that came into Yuma from the west for the two months of June and August, 1938, and for April, 1940. I guess I might as well finish this story. For the westbound business, Mr. Herrell didn't use recap sheets like that but he used forms 1216 and entered that information right on the train sheets themselves, you will find if listed on there, on the redispatched train sheets.

Mr. Mason:

Q. Do you wish those forms 1216, which as Mr. Sines has stated were used by Mr. Herrell?

Mr. Strouss: Not if the information is here.

[fol. 2779] Mr. Mason: It is not before you in the recaps because it was not recapitulated.

Mr. Strouss: It is on the train sheets.

Mr. Mason: Yes, it is on the train sheets. I think that is all we have of Mr. Herrell. Do you wish to cross-examine, Mr. Strouss?

Mr. Strouss: I think I prefer to have a look at these first.

Mr. Mason: I might call Mr. Baker in order to identify the Tucson division train sheets so he can turn those over to you if you wish.

The Court: Gentlemen, inasmuch as the Court has before it the dispatchers' records of actual movements of trains over the Rio Grande division, not that I have any desire to glutter the record, but do you have any objection to Mr. Herrell at the close of court explaining this system which is followed to the Court?

Mr. Mason: Certainly not.

The Court: Will you be kind enough to do that?

Mr. Mason: Yes. You may step aside for the moment, Mr. Herrell. Will you take the stand, Mr. Baker?

[fol. 2780] G. C. Baker resumed the witness stand for further direct examination as follows:

Mr. Mason:

Q. Mr. Baker, when you had completed the entries or the supervision of the entries made by the trick dispatcher upon redispatch train sheets concerning which you have previously testified what did you do with those train sheets?

A. I turned them over to Mr. Sines.

Q. Have you made an examination of exhibit No. 197, the exhibit showing siding extensions?

A. Yes, I have.

Q. Did you participate in conferences or a conference with Mr. Sines and others with respect to the question of the siding extensions which would be required on the Tucson division for the purpose of operating long trains according to the plan contemplated during the months of June and August, 1938?

A. Yes.

Q. Will you say whether or not the showing of siding extensions and of sidings to be extended as indicated on exhibit No. 197 represents your own view and judgment as to the sidings which would be required and the siding extensions which would be necessary for that purpose?

[fol. 2781] A. That is correct.

Q. Mr. Baker, I show you a volume of documents bearing on its outside cover the style "Gila to Tucson, Tucson to Lordsburg, August, 1938," and ask you whether this volume contains the train sheets of actual operation for the month of August, 1938, upon those portions of the Tucson division identified by the title?

A. They do.

Q. Will you please hand that to Mr. Stronss?

(Witness hands document to counsel.)

Q. I show you also a bound volume of documents bearing on its outside cover, "Yuma to Gila, Wellton to Phoenix,

Tucson to Nogales, August, 1938," and ask you if that is a volume of the original train sheets of the Tucson division for the month of August, 1938, covering those parts of the Tucson division referred to in the title?

A. It is.

Q. Will you hand that also to Mr. Strouss?

(Witness hands document to counsel.)

Q. I show you a bound volume of documents not contained in a cover and ask you whether this is the redispatched train sheets covering the movement of redispatched trains for the district between Yuma and Gila during the month of August, 1938, the first sheet bearing the [fol. 2782] date, Sunday, July 31, 1938?

A. It is.

Q. Will you hand that to Mr. Strouss?

(Witness hands document to counsel.)

Q. I show you now a volume of documents not bearing any title but apparently relating to the operations on the Tucson division between Gila and Tucson and ask you if those are the redispatched train sheets covering the redispatched operations on the Tucson division between Gila and Tucson during the month of August, 1938, the top sheet bearing the date, July 31, 1938?

A. They are.

Q. Will you hand that also to Mr. Strouss?

(Witness hands document to counsel.)

Q. I show you a volume of documents relating to the Tucson division apparently being the redispatched train sheets covering the operation of redispatched trains during the month of August, 1938, for the district Tucson to Lordsburg and ask you if those are the redispatched train sheets for that month?

A. They are.

Q. Will you hand that also to Mr. Strouss?

(Witness hands document to counsel.)

[fol. 2783] Q. I show you two volumes, one of them bearing title, "Gila-Tucson, Tucson-Lordsburg, June, 1938," and the other, "Yuma-Gila, Wellton-Phoenix, Tucson-Nogales, June, 1938," and ask you if those two volumes are

the volumes containing the actual train sheets covering actual operation on the Tucson division for the districts referred to in the titles for the month of June, 1938?

A. They are.

Q. Will you please hand those to Mr. Strouss?

(Witness hands document to counsel.)

Q. I show you a volume of documents the first of which bears the date, May 31, 1938, and refers to the district between Tucson and Lordsburg and Gila and Tucson and I will ask you if this volume contains the train sheets covering the redispatched operations for the month of June, 1938, between Gila and Tucson and between Tucson and Lordsburg?

A. They do.

Q. Will you hand that to Mr. Strouss?

(Witness hands document to counsel.)

Q. I show you a bound volume of documents the first of which bears the title, "Tuesday, May 31, 1938," and refers to the district between Yuma and Gila and also between Wellton and Phoenix and ask you if this volume contains the redispatched train sheets for the month of [fol. 2784] June, 1938, concerning which you have testified?

A. They do.

Q. Will you hand that to Mr. Strouss, please?

(Witness hands document to counsel.)

Q. Are the documents which you have just identified and handed to opposing counsel the actual train sheets or the redispatched train sheets, as the case may be, used by you or prepared by you or under your supervision and concerning which you testified earlier?

A. Yes, they are.

Mr. Mason: Your Honor, we ask that the record show the tender of these documents to opposing counsel. I also tender to Mr. Strouss for his use a copy of employees' timetable No. 109 for the Tucson division which is identified as having taken effect February 13, 1938, at 12:01 A. M., and I will ask Mr. Baker if that is the employees' timetable which was in effect in June and in August, 1938, at the period covered by the redispatching study of 1938?

A. Yes, that is the timetable.

Mr. Mason: Will you hand that to Mr. Strouss also?

(Witness hands document to counsel.)

[fol. 2785] Mr. Mason: Your Honor, I should like to have the record show that we have in the courtroom available for the use of opposing counsel, if they so desire, the conductors' time returns and delay reports covering the period to which the 1938 redispatching study relates on the Tucson division. I have as sample bound volumes here for the inspection of counsel and all the remaining time returns and delay reports will be made available if he so desires. Will you indicate if you do desire?

Mr. Strouss: When I finish my reading this evening.

Mr. Mason: Whenever you wish them, if you will advise us we will be glad to make them available. I also wish to state for the record we have in the courtroom three bound volumes of the white work sheets A together with certain recap sheets, the work sheets being numbered consecutively exclusive of the recap sheets from number one to 848, inclusive. These sheets, it appears, are similar in form to the typical sheet which was marked for identification as defendant's exhibit No. 198 and we tender these work sheets for the examination and use of opposing counsel.

Mr. Strouss: I would like to have those, I would like to have those with the tonight.

[fol. 2786] Mr. Mason: You are quite welcome. Mr. Sines asked me to say they are much easier to read and understand than the redispatched train sheets and, as he testified yesterday, they have been prepared directly from the redispatched train sheets and from the actual sheets, of course.

Mr. Strouss: I would like to have those, I will take the Tucson division train sheets and redispatched train sheets tonight, together with these recaps of the traffic into Yuma. There is no use in me taking the Rio Grande tonight.

The Court: I think we should recess now so you will have time to do that. The court will be at recess until ten o'clock tomorrow morning.

(Thereupon the court stood at recess until ten A. M., Thursday, January 23, 1941.)

[fol. 2787] January 23, 1941, Ten o'clock A. M.

Proceedings were resumed at this time as follows:

Mr. Mason: Your Honor, I will ask Mr. Sines to resume the stand for a moment, to make one correction in yesterday's testimony, and also to identify an exhibit.

B. S. Sines was recalled to the stand and testified further as follows:

Direct examination (Continued).

By Mr. Mason:

Q. Mr. Sines, at page 2666 of the recorded proceedings, you were asked in respect to the scope of the redispatching studies for 1940, particularly as to whether the South line via Douglas, was included in either of them, and I think that you stated that it was not. Do you wish to make a correction in that?

A. That is right, the redispatching study covered by Item 5 on Exhibit 196 did include the South line because some long trains had been run during the period between April 4th and April 30th. However, the redispatching study cov-
[fol. 2788] ered by Item 6 did not include the South line.

Q. That is, you didn't attempt to redispatch those long trains on the South line into still longer trains?

A. No.

Q. Now, I will ask you to refer to your exhibit No. 196 and particularly to Item 3 of that exhibit.

A. Yes.

Q. I recall that in your testimony you referred to the analysis of the passenger trains, Los Angeles, California, to El Paso, Texas, and so forth. Has that analysis been compiled in the form of an exhibit?

A. It has.

Q. Will you state the title of the exhibit?

A. "Los Angeles, California, to El Paso, Texas; Analysis of Passenger Operations for Year 1938, Showing Unnecessary Interference, Switching Delay, Adverse Routing, Reassignment of Passenger Car Space, Splitting and Consolidation of Trains, Cancellation of Assigned Car Movements, Excess Passenger Car Miles and Additional Helper Service Caused by Observance of Arizona Fourteen-Car Limit Law, Year 1938."

Q. That title then corresponds substantially to Item 3 [fol. 2789] of Exhibit 196, does it not?

A. Yes.

Q. The exhibit to which you have referred consists of 33 sheets?

A. Yes.

Q. And you have read the title from the first sheet?

A. I have.

Mr. Mason: May we have this exhibit identified as Defendant's Exhibit No. 199?

The Court: It may be marked for identification.

The Clerk: Defendant's Exhibit 199 for identification.

Mr. Mason: Did you prepare or supervise the preparation of No. 199 for identification, Mr. Sines?

A. I prepared a large part of it and supervised the preparation of the entire exhibit.

Q. What other persons worked with you in the preparation of Exhibit 199?

A. The trick dispatchers heretofore referred to in my description of the redispatching party, and the chief dispatchers of the three divisions, Mr. J. A. Day, Chief Dispatcher of the Los Angeles division, Mr. Henry Cassady, Chief Dispatcher of the Tucson division, and Mr. Herrell, [fol. 2790] Chief Dispatcher of the Rio Grande division.

Q. Has the exhibit been checked by any or all of those gentlemen?

A. It has been checked by each of the three chief dispatchers with reference to the territory under his supervision.

Q. Have you yourself checked it as well?

A. Yes.

Q. What underlying documents were used in its preparation?

A. The train dispatchers' train sheets for the entire year 1938 for the territory Los Angeles to El Paso, the passenger conductors' wheel reports for the territory Los Angeles to El Paso for the year 1938, the chief dispatchers' daily message and correspondence files for the entire year 1938, and log books from Yuma, Phoenix and Tucson, these log books being the running record kept by the terminal trainmasters of work performed on trains passing through the terminals.

Q. Are all of those records available for the use of opposing counsel?

A. Yes, they are here in Tucson and are available to opposing counsel.

Q. Where are these records now being kept for the time being?

[fol. 2791] A. In my office across the street, at 90 Church Street.

Q. Are they so arranged so as to be easily inspected or readily inspected by opposing counsel at that place?

A. That is right. We also have some of them stored in fireproof vaults, located on Southern Pacific property down near the station. In addition to the records that I mentioned, we had also the passenger conductors' time returns and delay reports.

Q. Is the passenger conductor's time return and delay report a document similar to the sample sheets in your Exhibit 195?

A. Yes.

[fol. 2792] Q. About how many documents or how much bulk is involved in the underlying records which you have referred to as having been used for the purpose of exhibit No. 199?

A. I imagine it would make a pretty good load for a five-ton truck, thinking of it in volume. It would probably weigh pretty close to five tons also.

Q. I take it it would be possible though hardly practicable, to bring it into the courtroom?

A. We could do it.

Q. Would you prefer to make them accessible to opposing counsel at their present location?

A. I would.

Q. I take it that he would also. Insofar as exhibit No. 199 presents the matters shown upon the train sheets and other underlying documents, will you say whether or not it is a true and correct presentation of the matters shown thereon?

A. It is.

Q. And has been checked for the purpose of determining that it is true and correct?

A. Yes, sir.

The Court: Mr. Sines, this particular exhibit No. 199 has wholly to do with actual operations and nothing to do

[fol. 2793] with the redispatched or assumed operations?

A. That is partly true in that it is an analysis of actual operations from the standpoint of interference, delay, switching, and the other things named in the title which would not have been necessary had we not been observing the Arizona 14-car limit law.

Q. But the data are taken from actual records and actual operations?

A. Yes, sir.

Q. You may have drawn certain conclusions here but those conclusions are not drawn from any assumed operations?

A. I will say "assumed" today. We had to assume there was no Arizona 14-car limit in order to find out what would not have been necessary, but in the first instance we had to make a complete record of the moves and movements and all that is based on actual performance.

Q. Last evening you presented here in connection with another exhibit the dispatchers' sheets covering the redispatch study that was made?

A. Yes, sir.

Q. Is any of this data in this exhibit taken from any of those redispatched sheets or is it all from actual operation? [fol. 2794] A. No, it is not all from actual operation. There always has to be the assumption that such and such would have been unnecessary had we not been required to comply with the 14-car limit.

Q. Were any of the redispatched sheets which were referred to in yesterday's testimony used in the compilation of this particular exhibit?

A. The redispatched sheets that we were talking about yesterday had to do with a freight redispatching study in June and August, 1938, and we set up assumed passenger operations or redispatched operations along with our redispatched freight operations for those two months. Some of those redispatched operations are abstracted into this exhibit.

The Court: You may proceed.

Mr. Strouss: I had a question along the same line I intended to ask, it puts at a little different than the Court has asked it. Disregarding the title of your different sections and subdivisions, the matter which is set forth in those titles is an abstract or summary of actual records?

A. Yes, everything occurred actually that is listed on this exhibit.

Q. The only thing that is not in the summary or abstract of record is the conclusion which is expressed in the [fol. 2795] titles?

A. That is right.

Mr. Mason:

Q. I am going to ask you, Mr. Sines, if the conclusion which is expressed in the title or otherwise in the exhibit as to the possibility of having avoided these occurrences represents your own conclusion arrived at after examination of the train sheets and other underlying documents?

A. Primarily it represents conclusions of the chief dispatchers. Understand in this redispatching study not only the passenger redispatching study but the freight redispatching study, I was in the position of saying, "Me, too," after they had shown me that such and such a redispatched operation was a practical common-sense operation. I insisted upon having these things proven to me, but the chief dispatchers are the ones responsible in the first instance.

Q. Do these statements represent the conclusions of the chief dispatchers as submitted to you and concurred in by you?

A. Yes.

Mr. Mason: I will ask permission to withdraw Mr. Sines at the present time. I want to substantiate the exhibit by [fol. 2796] calling the chief dispatchers as well.

Q. Mr. Sines, in the course of the preparation of exhibit No. 199 for identification, did you prepare work sheets as an intermediate step to the preparation of the final exhibit?

A. We did.

Q. Have you those work sheets in court with you?

A. I have.

Q. Approximately how many work sheets are there?

A. I suppose there are in the neighborhood of forty or fifty work sheets in this bundle that I have in my hand.

Q. The work sheets themselves are approximately the size of an ordinary train sheet, are they?

A. It is half of a train sheet.

Q. Are those work sheets available for the use of opposing counsel in their study and possible cross-examination upon exhibit No. 199 if the exhibit is received?

A. They are.

Q. Will you tender those to Mr. Strouss?

(Witness hands document to counsel.)

Mr. Mason: May the record show that the work sheets referred to by the witness have been handed to opposing [fol. 2797] counsel.

Mr. Strouss: If you are going to take Mr. Sines off the stand for the purpose of showing that these conclusions are the conclusions of the chief dispatchers——

Mr. Mason: I have asked Mr. Herrell already by identifying this by item No. 3.

Mr. Strouss: I will say to you now that while I think there might be some objection to their testifying, it is their conclusions, I am not going to object to this exhibit on the ground, when you have offered it, that it is a conclusion because I understand from Mr. Sines that the facts from which those conclusions are drawn are in the exhibit.

Mr. Mason: I think they are recited in some fashion.

Mr. Strouss: I will have an opportunity later if I so desire to examine the chief dispatchers as to this exhibit.

Mr. Mason: Yes. In view of what you have said, if it may be understood that a proper foundation has been considered laid, I will offer the exhibit and that will dispense with some of our legal gymnastics here.

The Witness: I think I might make an explanation which [fol. 2798] would assist Mr. Strouss.

Mr. Mason: I wish you would.

The Witness: These work sheets which I have handed Mr. Strouss contain 173 numbered items which were analyzed in full detail during the year 1938 and which are recapped onto exhibit No. 199 for identification. A complete history of each occurrence will be found in the work sheets. The recapping is made onto the exhibit. It will be necessary to examine exhibit No. 199 for identification along with the work sheets in order to get the complete story.

Mr. Mason: In view of what has been said I will now offer exhibit No. 199 as defendant's exhibit.

Mr. Strouss: I have no objection with the understanding I will have the opportunity to cross-examine later.

The Court: It may be admitted in evidence. Counsel for the State will be given full opportunity not only to cross-examine Mr. Sines but the chief dispatchers who aided in the preparation of this exhibit.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 199.")

[fol. 2799] Q. Mr. Sines, will you take up Exhibit 199. Perhaps a little explanation as to the construction of the exhibit itself would be in order. What are sheets 1 and 2 of the exhibit?

A. Sheets 1 and 2 are summary sheets of the other 31 sheets.

Now, taking section 1 on sheet 3 as an example, how do you summarize the showing on section 1 so as to bring it forward to the summary which appears with the same identification on sheet 1?

A. The title of section 1, sheet 3, is brought forward to the first summary sheet, sheet 1, and repeated verbatim. The totals of section 1 shown on sheet 3 are then brought forward to sheet 1 in the appropriate columns. For instance, character of interference, column A, sheet 1, is shown at switching, and a review of sheet 3, column E, shows that in all instances the character of interference is switching, except in the very first one, and even there the operation of splitting up trains is a switching operation. The number of instances, column B, is indicated as 12 on sheet 1, and the total of column A also indicates 12 on sheet three.

The Court: Now, this summary covers the passenger [fol. 2800] operations for the entire year 1938 in the territory shown?

A. Yes, sir.

Mr. Mason: Now, is each of the other sections summarized on sheets 1 and 2 brought from the title of the section in the same manner as you have explained for section 1?

A. That is right.

Q. How did you arrive at the total shown at the foot of sheet one?

A. That is a mathematical computation the same as all the figures above.

The Court: Well, Mr. Sines, would you be kind enough, on sheet 3, to elaborate just a little on the totals shown there, analyze that to the Court, please. I am referring now just to the totals.

A. Yes. There were twelve items, or rather twelve instances during 1938 when we discovered interference as indicated in the title of section one. The dates of those occurrences are shown in column B. The trains involved are shown in column C by number, and counting the number of trains, it will be found there were twenty-three trains.

The Court: In other words, there were twelve instances [fol. 2801] when there was this conflict, and it involved 23 trains, is that it?

A. That is right. The reason for that is that when a train approaches the Arizona-New Mexico state line with a consist in excess of fourteen cars, or when it is known that the train after crossing the line is going to pick up cars which would put its total over fourteen cars, some provision must be made in advance of crossing the state line; so that train must set out cars which will be handled in some other train whose limit will not exceed fourteen cars, or another extra train must be run to take care of the excess cars, so, in almost all instances it means there are two trains involved; the train surrendering the cars and the train picking up the extra cars.

The Court: Now, the other totals to the right.

A. Yes. As I recall, the train dispatcher's train sheet, or else it was the conductor's delay report, some one of the records that I mentioned that we had at hand indicated that in occurrence No. 111 one of the trains had been delayed ten minutes at Lordsburg, and another one had been delayed eight minutes while this exchange of cars or making up of new trains occurred, so we added that up and we have just [fol. 2802] the two trains which were delayed eighteen minutes, or an average of nine minutes per delay. Now, I said that speaking of columns G and H, I said that usually it means one train is ing to surrender some cars when it approaches the state line and we have added up the number of cars which had to be set out, and you find there were 29 cars that were set out by trains coming up to the Arizona state line. There were 35 cars picked up, however, and that is because when the second section is operated, or when an extra section is operated, we don't like

to put the passenger car right up against the engine, and we put a buffer car in between the engine and the cars with the passengers in. Sometimes that car is an empty car or it may be a baggage car or an express car, but the net result is that we are going to handle more cars than we ordinarily would have handled from one point to another, and in the six instances here we had to take another car for part or all of the distance across Arizona.

Mr. Mason: Now, is the showing in sections 8 to 14 inclusive somewhat different from that in sections 1 to 7B inclusive? You use a different form of summary, I notice, on sheet 2.

A. Yes.

[fol. 2803] Q. How do you obtain the totals which are indicated there?

A. That is true, Mr. Mason, the character of information abstracted in sections 8 to 14 is somewhat different than the information in sections 1 to 7B, and the reason for that is that generally in sections 1 to 7B we are concerned primarily with trains, whereas, in sections 8 to 14 we are analyzing movement of individual cars. Now, you asked some question about a total, Mr. Mason.

Q. How were the total figures arrived at in the totals shown on sheet 2 for each of the items?

A. Well, it would be necessary to refer to section 8, for example, which is found on pages 15 and 16 of the exhibit and where the totals found at the foot of sheet 16 are either the result of counting or of adding mathematically the figures appearing above.

Q. Is the same process followed as to each of the other sections other than section 14?

A. Yes.

The Court: Referring there to section 8 for a moment. You use the expression "unnecessary delay to deadhead equipment." Just what do you mean by that, Mr. Sines?

A. Equipment not in service, equipment which is being [fol. 2804] moved from one part of the railroad to another part of the railroad, or from one part of the country to another part of the country in anticipation of its need at some other point, or following a trip in service.

Mr. Mason: Is Pullman equipment ever moved in that fashion, Mr. Sines?

A. Yes, a large part of this equipment noted here as deadhead was Pullman equipment.

Q. Why would that be moved deadhead?

A. Well, that is the result of special movements, sometimes conventions on the Coast, taking large parties to California. When they get over there the parties may break up, you don't need as many cars in California to take that group back all at one time as when going over there.

The Court: That would be comparable to your empties in your freight operations?

A. That is right.

Mr. Mason: Have you any further questions, Mr. Strouss?

Mr. Strouss: Not at the present time.

Mr. Mason: We will withdraw the witness with the understanding, of course, that cross-examination may be had of any of the witnesses who would testify in connection with this exhibit.

[fol. 2805] Mr. Strouss: I want to say that there is a lot of stuff now that is coming up and I am going to simply have to have time to prepare for cross-examining the witness.

The Court: That is what we have the week-end for.

Mr. Strouss: I am afraid it is going to require more than a week-end.

Mr. Mason: Do you care to cross-examine any of the witnesses who have so far testified?

Mr. Strouss: The only one that I could is Mr. Herbert.

Mr. Mason: He is going to appear again in connection with some additional exhibits.

Mr. Strouss: I worked as much as I could last night in reading this stuff.

Mr. Mason: We are somewhat anxious to get Mr. Baker released as soon as possible because his superior has been taken to the hospital in that department.

Mr. Strouss: I could probably take him and ask some questions now, with the understanding that if later I wanted him to come back, I could have him. This exhibit that has just gone in——

Mr. Mason: Mr. Baker didn't participate, as I recall, in exhibit 199.

[fol. 2806] Mr. Strouss: Oh, he didn't?

Mr. Mason: Although it was submitted to him for review and check. Mr. Cassady actually participated in its preparation.

Mr. Strouss: I think I could probably take him for cross-examination. Of course, I don't like to say that I will release him entirely because I don't know what may come up in connection with these assumed operations.

Mr. Mason: He can come down here for further cross-examination.

Mr. Strouss: That is just what I can't anticipate in matters that may still come up.

Mr. Booth: I would like to state, in fairness to counsel, that we would like to have all of the cross-examination of our witnesses concluded before the close of our case, which is reasonably near, and particularly because some of our witnesses are reserve officers and we don't know what may happen about their being called into service during the vacation. We don't want their testimony to be in the position where it might be subject to be stricken out because of the lack of opportunity for cross-examination.

Mr. Strouss: I appreciate that, Mr. Booth. As you realize, these records that are given me, there is just so [fol. 2807] much that a person can do, and that is all.

Mr. Booth: There is a limit to a man's eyes.

Mr. Strouss: That is right. I have the profile maps over there that I am trying to get an opportunity to go through, and whenever I would get a few minutes to check and go over the testimony of the witnesses who have testified to prepare for cross-examination, but this matter that came up here yesterday and today, there is so much of that, I will have to go into those records before I will know what I am going to do.

The Court: That is apparent. I am sure that can be worked out, Gentlemen.

Mr. Booth: We have tentatively thought that we might be able to close our case by the 7th of February with the possibility of its running over into the next week, and making allowance for some cross-examination. Of course, counsel may conclude that the best cross-examination is rebuttal, I don't know.

The Court: Mr. Booth, when you say the 7th of February, you mean that would be closing your defense in this matter, including the safety angle, by that date?

Mr. Booth: Yes. It might be the following week, but we [fol. 2808] had hoped that, making allowance for cross-examination, we might be able to conclude by the seventh of February. It is in sight now. It is right in the immediate prospect; we can count noses and just about estimate the length of time that will be required for our direct examination.

Mr. Strouss: The reason I mentioned the possibilty of time this morning, when Mr. Booth told me last night that they might finish by the seventh, of course, as your Honor mentioned, we have these week-end recesses, but I have an office in Phoenix that I do have to at least drop into occasionally, but when you told me that last night—it sometimes will save time to take an extra recess and I thought it may be possible here that we can save time. I can tell a little later, by taking the recess a day or two earlier so that I can have a chance to examine these and see what I would want.

Mr. Booth: Yes, we want to accommodate ourselves to counsel. That might be the solution, to have a whole week's recess and then come back.

The Court: The Court is of the opinion that that would be the best way, to give you a week intervening between the close of their present defense and your cross-examina-[fol. 2809] tion of these Southern Pacific officers and employees.

Mr. Strouss: That is fine. If they prefer to have me take that time earlier, it doesn't make any difference to me, but it is apparent to me now that I am going to have to ask for some time in there. I appreciate that counsel has been very kind in that respect.

Mr. Booth: Yes, this testimony is being poured in in a very highly concentrated form.

The Court: You may proceed. Call your next witness.

Mr. Mason: Do you wish to go on with Mr. Baker now?

Mr. Strouss: I started to say that I think at two o'clock I can take him. I believe I can probably complete it so he won't have to come back at all.

Mr. Mason: Then we will call Mr. Cassady at the present time.

The Court: Come forward.

[fol. 2810] HENRY W. CASSADY was called as a witness in behalf of the defendant and being first duly sworn testified as follows:

Direct examination.

By Mr. Mason:

Q. Will you please state your name and employment to the reporter?

A. Henry W. Cassady, chief dispatcher, Tucson division, Southern Pacific Railroad.

Q. Are your headquarters at Tucson, Mr. Cassady?

A. Yes, sir.

Q. How long have you been chief dispatcher of the Tucson division?

A. Since the twenty-fourth day of August, 1939.

Q. Were you previously in service as a dispatcher or assistant chief dispatcher on the Tucson division?

A. Yes, sir, since the twentieth of February, 1917.

Q. What was your previous experience in railroad service prior to 1917?

A. I had worked as agent, operator, car distributor, chief dispatcher.

Q. You have been at Tucson in the dispatching force of [fol. 2811] the Tucson division since 1917?

A. I have, yes, sir, except for a short period of time I was detached from the dispatcher's office and used as a train rules examiner.

Q. What duties does the train rules examiner perform?

A. He examines all employees as to their knowledge of the operating rules of the company.

The Court: Is that an individual examination that you make?

A. Individual personal examination, yes, sir.

Q. You don't conduct a class or school in connection with it?

A. No, not in that case, that is in the case of a new employee or a promoted man, a brakeman to a conductor or operator to a dispatcher; fireman to an engineer.

Q. You test his knowledge of the rules and regulations of the company covering his position?

A. That particular position, yes, sir.

Mr. Mason:

Q. You have been chief dispatcher since 1939 and prior to that were assistant chief dispatcher at Tucson?

A. For several years, yes, sir, perhaps ten or twelve years.

Q. You heard the testimony of Mr. Baker as to the ex- [fol. 2812] tent of the jurisdiction of the chief dispatcher at Tucson?

A. I did.

Q. Did you hear his description of the duties and responsibilities of the chief dispatcher?

A. Yes, sir.

Q. And of the trick dispatcher?

A. Yes, sir.

Q. Will you say whether or not that description is applicable to your present position?

A. It is.

Q. Did you hear the testimony of Mr. Sines as to the redispatching study of 1938 relating to the Phoenix line?

A. I did.

Q. Are you the Mr. Cassady referred to in his testimony as having performed or supervised the redispatching of the December business on the Phoenix line in 1938?

A. I am.

Q. For the purpose of the redispatch on the Phoenix line in 1938, did you contemplate the use of any different type of locomotive than was in actual operation in December, 1938?

A. No, I did not.

Q. Did you contemplate any siding extensions on the [fol. 2813] Phoenix line other than at the station immediately north and west of Picacho?

A. No, I did not.

Q. Will you state the name of that station?

A. Topaz.

Q. What, if any, conditions did you contemplate for the purpose of the redispatch as to the availability of traffic at the start and during the course of the month of December, 1938?

A. For the redispatch study we had a yard report showing the cars on hand for movement at both Phoenix and Tucson and for the entire period we moved car for car that was handled via this route.

Q. Did you contemplate there would be any more or less traffic available at either terminal for movement via Phoenix route?

A. No, not in this case.

Q. You were also mentioned in Mr. Sines' testimony, I think, as having participated in or supervised the redispatching studies for the year 1940?

A. That is right.

Q. Were you the chief train dispatcher at Tucson during the months of March and April, 1940?

A. Yes, sir.

Q. Did you supervise the conduct of the two redispatch-
[fol. 2814] ing studies of 1940 which are mentioned on Mr. Sines' exhibit No. 196?

A. I did.

Q. Have you a copy of that exhibit before you?

A. Yes, sir.

Q. I refer you first to item No. 5. At what point did you start your redispatching study of eastward traffic during the period covered by item No. 5 of exhibit No. 196?

A. Yuma, Arizona.

Q. What traffic was handled commencing on April 4th from Yuma?

A. All traffic on hand at Yuma at 12:01 A. M., April 4th, and all arriving and originating at Yuma or Somerton.

Q. Is that the same traffic that was actually handled in the trains operated out of Yuma on April 4th?

A. Yes, sir.

Q. Did you during the period following April 4th operate a number of trains eastward out of Yuma or over the district between Yuma and Gila, Gila and Tucson, with more than 70 cars?

A. Eastward?

Q. Yes.

A. I don't think so.

[fol. 2815] Q. If there were trains operated eastward between Yuma and Tucson of more than 70 cars, what was done with the extra cars in your redispatching study corresponding to item No. 5?

A. They were moved on trains other than the actual train operated.

Q. In the redispatching study did you observe the 70-car restriction?

A. We did.

Q. In connection with the redispatching study, item No. 5, at what point did you start your redispatching study of westward traffic?

A. Lordsburg, New Mexico.

Q. Did you also redispatch traffic moving westward and arriving at Tucson via south line?

A. We don't have any jurisdiction over the south line on the Tucson division, no, sir.

Q. Traffic handled via south line and coming to your division at Tucson would be included in your westward redispatch?

A. Westward redispatch from Tucson, yes, sir.

Q. Did you actually operate trains westward from Lordsburg or westward from Tucson consisting at times of more than 70 freight cars?

A. Yes, sir.

Q. And in the redispatching study did you observe any [fol. 2816] restriction as to the length of the redispatched trains?

A. We did.

Q. What restriction did you observe?

A. 70-car limit for freight trains.

Q. Did you in the redispatching study handle any more or less or different traffic than was handled in your actual trains during the period from April 4th to April 30th, 1940?

A. The identical same traffic was handled in actual and redispatched.

Q. Does that mean that the same cars were handled?

A. The same cars would not be handled on the same trains, it would be necessary to operate additional trains from time to time in order to take care of the reduction from the over-size trains operated.

Q. By "over-size" you mean more than 70 cars?

A. More than 70 cars.

Q. For the purpose of the redispatching study covered by item No. 5 of exhibit No. 196, did you contemplate the same siding facilities as existed during that period?

A. Yes.

Q. Are they the same or substantially the same siding [fol. 2817] facilities that exist today?

A. That is right.

Q. Did you contemplate the use of the same locomotives or the same class of locomotives?

A. That is right.

Q. Are they the same locomotives which were in service following April 30 and likewise today?

A. Yes, sir.

Q. Did you yourself make all of the entries on the redispatched train sheets for the purposes of the redispatching study, item No. 5, of exhibit No. 196?

A. I did not.

Q. Were some of those entries made by some other person?

A. Yes, sir.

Q. By whom?

A. By a trick dispatcher that I had with me.

Q. Was this trick dispatcher working under your supervision?

A. He was.

Q. What, if any, check of the entries made by the trick dispatcher did you yourself make?

A. They were all checked.

Q. Was the trick dispatcher's work done under your supervision?

[fol. 2818] A. Yes, sir.

Q. What was the character of the entries made by the trick dispatcher?

A. The time at way stations or intermediate stations between terminals; the arriving time at the district terminal; the transcript of the conductor's delay report of the actual train as compared with the redispatched train; the additions or subtractions from this delay report as the case might be.

Q. Did you yourself make the entries as to departure times from originating terminal?

A. In most all instances I made them myself or instructed as to the time they should set to depart.

Q. Did you yourself determine the consist of the redispatched trains?

A. I did.

Q. You have heard the testimony of Mr. Baker and Mr. Sines as to the variations in train speed over the road assigned the redispatched trains as compared with actual trains on account of the ratio of the loading to the tonnage rating of the locomotive handling the train?

A. Yes, sir.

Q. Did you follow the same principles as described by [fol. 2819] them in assigning the train speed to the redispatched trains?

A. I did.

Q. Mr. Cassady, with respect to the matter of tonnage rating in general, is that a matter with which the dispatchers and chief dispatcher is familiar?

A. Absolutely.

Q. Is that necessary to his job?

A. Absolutely, yes, sir.

Q. Tonnage rating of a locomotive over a particular district is an expression of just what feature? I want you to describe it in terms which I as a layman and Mr. Strouss as a layman may understand easily.

A. It is the amount of tonnage that a locomotive can pull over any given section of the road.

Q. Of the particular stretch of road to which the rating relates?

A. That is right.

Q. The same locomotive, then, or the same type may have a different rating westward from Tucson to Gila than it has eastward from Tucson to Lordsburg, is that correct?

A. That is right.

Q. What causes that difference in the rating of the same [fol. 2820] locomotive?

A. A difference in the grade.

Q. Then I take it that the rating varies according to the physical characteristics of the district over which the locomotive is to run even though the tractive effort of the locomotive is constant, is that correct?

A. That is correct.

Q. Is the rating of a locomotive over a particular district determined by computation or by experiment and experience?

A. It is determined by a mechanically operated device used for test purposes with one particular type of locomotive.

Q. Is each type rated by the use of this test?

A. That is right.

Q. You say a mechanically operated testing machine. What is the name of that device?

A. I wish you hadn't asked me that because I can't remember the name of it now.

Q. May I suggest the dynamometer car?

A. That is right.

The Court: In other words, after a locomotive has been tested by this dynamometer car, you know what it would do, you don't have to hitch it to a train and run it over [fol. 2821] a given stretch of territory to see whether it would pull the load?

A. No.

Q. You know exactly what it will do?

A. That is right.

Mr. Mason:

Q. Is the tonnage rating virtually the maximum hauling capacity of the locomotive over the particular district?

A. No, it is the standard.

Q. Standard of its hauling capacity?

A. Yes, there is some tolerance in the load. The locomotives will handle in excess of the rating as shown in our working timetables, but we fix the rating for a locomotive so that it will be able to handle a train at fair speed.

Q. Referring to item No. 6, the freight redispatching study for April 4th April 30th, 1940, all as indicated in more detail on defendant's exhibit No. 196, will you say whether or not you made or supervised that study insofar as the Tucson division was concerned?

A. I did.

Q. Was that conducted by you in the same manner as the other redispatching study?

A. It was.

Q. Did you also in that case make out redispatched train sheets?

[fol. 2822] A. Yes, sir, we did.

Q. Who made the entries upon the redispatched train sheets?

A. The trick dispatchers assisting me and myself.

Q. Did you supervise the entries made by the trick dispatchers?

A. I did.

Q. Did you check the entries made by them as to their propriety and correctness?

A. I did.

Q. As to the entries on the redispatched train sheets made by these trick dispatchers as to items Nos. 5 and 6, will you say whether or not you vouch for them?

A. I do.

Q. Were the same principles of dispatching and operating trains from the standpoint of the dispatcher observed in these redispatching studies which you made or supervised as observed in the actual conduct of the railroad?

A. Yes, sir, just the same.

The Court: We will take our mid-morning recess at this time.

(Thereupon a short recess was taken, after which proceedings were resumed as follows.)

[fol. 2823] The Court: You may proceed.

Mr. Mason: Mr. Cassady, in the redispatching studies which you conducted, particularly the freight redispatching studies, did you undertake to match up your redispatched trains with trains as actually run?

A. Yes.

Q. You state on the redispatching study corresponding to Item 5 you ran additional trains?

A. That is correct.

Q. Were they matched up with any actual trains?

A. No, they couldn't be.

Q. Did you work out or check the work at the points at which meets and passes would take place for the redispatched trains?

A. No.

Q. Who prepared that work?

A. Dispatchers.

Q. The trick dispatchers?

A. The trick dispatchers, yes, sir.

Q. Did you check their work after it had been entered on a redispatch train sheet?

A. Yes, sir.

Q. Will you say whether or not their working out of meets and passes and other items of the run correspond to your own judgment as proper or not?

[fol. 2824] A. They did.

Q. In the actual operation between April 4th and April 30th, 1940, Mr. Cassady, generally speaking, what particular description of trains were run in units of more than 70 cars?

A. Drags.

Q. Did you run any of your manifest trains with more than 70 cars?

A. A few.

Q. Did you undertake to run trains of more than 70 cars in both directions during that period?

A. We did.

Q. At the same times and on the same days?

A. Well, perhaps approaching the end of the district, as Mescal to Tucson, you will find trains of more than 70 cars in each direction, and there are a few cases where we operated trains of more than 70 cars in each direction between Tucson and Gila, taking advantage of a few long sidings that we did have.

Q. Generally speaking, you operated the long trains in one direction or the other on the same district on the same day?

A. That is correct.

Q. But not in both directions. What train length did you observe as to trains moving against the long-train [fol. 2825] direction, if I may call it that?

A. In our term, we call them siding clearance trains.

Q. By siding clearance trains, what do you mean?

A. We mean perhaps sixty-five to sixty-seven cars, depending upon the length of the cars involved in the train.

Q. By "siding clearance" you mean trains that could get into almost any of the sidings in order to make a meet; is that correct?

A. That is correct.

Q. I may not have mentioned, but did you participate in the passenger redispatching studies of 1938, that is, the redispatching study and the analysis mentioned as Items 2 and 3 of Exhibit 196?

A. I did.

Q. And in the passenger redispatching study, did you follow the same principles which have been stated here and which you have stated that you observed as to items 4, 5 and 6?

A. Yes, sir, that is correct.

Q. Did you assume or contemplate the use of any different type of locomotives for the operation of passenger trains?

[fol. 2826] A. No, sir.

Q. Have you reviewed and checked the showing which is now in evidence as Mr. Sines' exhibit No. 195?

A. Yes, sir.

Q. And in so far as that exhibit relates to the Tucson division, will you say whether or not it expresses your own conclusion predicated on your experience?

A. Yes, sir, it does.

Q. I take it that you are familiar with the ratings of the types of locomotives now in use on the Tucson division in freight service. Are you also familiar with the rating of the AC-8 class of locomotives over the Tucson division?

A. Yes.

Q. Generally speaking, how does the rating of the AC-8 class locomotive compare with the rating of the F-4 class, expressed in percentage relationship?

A. About 165 per cent, I guess, something like that.

Q. And, generally speaking, how does the rating of the AC-8 locomotive compare with the rating of the 5000 class S. P. type locomotive?

A. I have never worked that out, I don't know just [fol. 2827] exactly what it would be. About—I have worked it out some place, I don't remember where we worked it out.

(The witness made some calculations off the record, during which he mentioned some figures which were inaudible to the reporter.)

Mr. Mason: You speak of the approximate rating of the S. P. as 4350?

A. Yes, from Tucson to Dragoon.

Q. And you spoke of the AC-8 locomotive class as approximately 6200, didn't you?

A. That is right.

Q. Then the percentage relationship can be figured from those two figures?

A. Yes, that is right.

Q. Now, will you say whether or not the redispatching studies which you have supervised and in which you have participated as described by you, represent to the best of your judgment the manner in which trains and traffic would have been operated and handled and could have been so operated and handled at the times covered by such studies and under the conditions contemplated by the several redispatching studies?

A. Absolutely, yes, sir.

Q. Mr. Cassady, when you had completed, or, rather, [fol. 2828] when the redispatch train sheets for the various redispatching studies had been completed with all of the entries thereon; did you turn those redispatch train sheets over to anybody?

A. Yes.

Q. To whom did you hand them?

A. Handed them over to Mr. B. S. Sines.

Q. In connection with the passenger redispatching study, Item 2, did you make redispatch train sheets there, or just work sheets?

A. Just used work sheets.

Q. Did you turn those work sheets over to Mr. Sines?

A. Yes, sir.

Mr. Mason: Your Honor, I would like at this time to tender to Mr. Strouss the actual and redispatch train sheets covering the redispatching studies for 1940 for the Tucson and Rio Grande divisions. Unfortunately, we are still making some use of those and they won't be available until Monday. I want the record to show that they are available, and we will tender them just as soon as possible.

Mr. Strouss: The record may show that you have tendered them and then when I get to where I can use them I will advise Mr. Sines and take them. Some of the rec- [fol. 2829] ords that were tendered to me yesterday are left with Mr. Sines because I couldn't use them all at once. I will indicate when I am ready to use them.

Mr. Mason: It perhaps would be better that the record do show that we do tender them and Mr. Strouss may have them when he wishes, with that reservation as to next Monday.

Q. Mr. Cassady, have you seen Mr. Sines' exhibit No. 197, which is the outline map of the divisions with the siding extensions indicated?

A. Yes, sir, I have.

Q. Have you reviewed that exhibit?

A. Yes, sir.

Q. Did you participate in the conferences at which these siding extensions were determined?

A. Not in San Francisco, no, or Los Angeles.

Q. Have you reviewed the exhibit since or reviewed the determination since it was made?

A. I have.

Q. Now, will you say, basing your answer upon your own experience and familiarity with the division and your qualifications as dispatcher and chief dispatcher, whether or not the showing of siding extensions on Exhibit No. 197 in so far as that exhibit relates to the Tucson division, [fol. 2830] reasonably expresses the sidings and siding extensions which would be necessary for the operation of trains according to the plan contemplated for the 1938 redispatching study?

A. It does.

Q. And whether or not the same would be true as to the plan contemplated for the 1940 redispatching study, in which the use of the AC-8 type of locomotive and the operation of trains corresponding to that locomotive was contemplated?

A. Yes, sir, it does.

Mr. Mason: I think that is all we have of Mr. Cassady at this time.

Mr. Strouss: I will reserve my cross-examination.

The Court: You may step aside. Call your next witness.

Mr. Mason: We will recall Mr. Herbert.

W. P. Herbert was recalled to the stand and testified further as follows:

Direct examination (continued).

By Mr. Mason:

Q. Mr. Herbert, have you before you a statement in one sheet entitled "Southern Pacific Company Grade Cross- [fol. 2831] ings Within the State of Arizona as Reported to Corporation Commission of the State of Arizona, Year Ended December 31, 1939. By Southern Pacific Company," and so forth?

A. Of the State of Arizona, yes, sir.

Mr. Mason: May we have this statement marked for identification No. 200?

The Court: It may be marked.

The Clerk: Defendant's Exhibit No. 200 for identification.

Mr. Mason: Did you prepare Exhibit No. 200 for identification, Mr. Herbert?

A. Yes, I did.

Q. And from what sources?

A. From the annual reports for the various years shown as reported to the State of Arizona by the Southern Pacific Company.

Q. Are the classifications of the crossings, as shown in lines 1 to 10, shown on the report?

A. Yes, they are exactly as shown on the report.

Q. Do you have the reports made to the Corporation Commission from which the exhibit was prepared?

A. Yes, we do.

Q. Now, as to the detail of the exhibit in columns D and E, are those the details as to numbers added and numbers [fol. 2832] eliminated shown in the annual report?

A. Yes, they are.

Q. Will you say whether or not the exhibit is true and correct?

A. Yes, I checked it myself and made it myself.

Q. And is the total in line 11 a reported total or computed total?

A. It is a summation of those shown above, and is also shown in each report.

Mr. Mason: Have you any questions, Mr. Strouss?

Mr. Strouss: As I understand it, this is the resume of the report to the Corporation Commission as to grade crossings?

A. Yes, it is a resume and is practically a copy, or is a copy of the method and manner in which it is reported to the Commission.

Mr. Mason: Does this include grade crossings on branch lines as well as on main lines?

A. Yes.

Q. Does it include crossings over spurs or industrial tracks as well as those over main track?

A. Yes.

The Court: Just what do you mean by "grade crossing," Mr. Herbert?

A. A grade crossing, Your Honor, is a road or high- [fol. 2833] way that crosses the railroad tracks at grade

or, in other words, along the same level as the level of the rails.

Q. There has to be a road, otherwise you would not classify it as a grade crossing?

A. That is right; it is a road or highway over which vehicular traffic might cross.

Q. That might be a private way into some man's ranch?

A. No, this is just public crossings, public grade crossings. Private crossings are usually covered by a separate agreement with the farmer on either side of the railroad. However, I might check into that. My understanding is that this is just public crossings.

Mr. Mason: These are the crossings as reported to the Commission?

A. Yes, as reported.

Mr. Strouss: When you speak of spur tracks, do you mean switches to industrial plants?

A. Occasionally there will be found a grade crossing over a spur track.

Q. Suppose you have a road that crosses a number of railroad tracks, that would only be considered as one crossing?

A. Yes, that is right.

[fol. 2834] The Court: How about driveways? I don't know the situation on the Southern Pacific, but I know on the Santa Fe that periodically they make provision for the crossing of livestock, possibly not a road there. Would that be counted as a grade crossing, or do you have any such?

A. Well, I believe that comes under the heading of private crossings in most instances in out-of-the-way places where we permit private crossings to be constructed by agreement with the cattle owners of property owners on either side of the railroad track or right-of-way fence. In those cases, they usually have gates which have a sign on them which prohibits public use of those gates without proper authority.

Q. Your right-of-way is fenced the entire distance?

A. No, not the entire distance. There are spaces where there are no fences.

Mr. Strouss: This report to the Corporation Commission doesn't segregate in any place these crossings so far

as congested districts and uncongested districts are concerned, that is, their location; they may be in a congested community like the Salt River Valley?

A. No, it does not.

[fol. 2835] Q. Of course, when you say that it covers branch lines, it covers grade crossings within cities and just communities of that sort?

A. Yes.

Mr. Mason: We offer the exhibit in evidence as Defendant's Exhibit No. 200.

Mr. Strouss: No objection.

The Court: It may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 200.")

Mr. Mason: Have you before you, Mr. Herbert, a statement in one sheet entitled "Grade Crossings Within the State of Nevada as Reported to the Public Service Commission of the State of Nevada, Year Ended December 31, 1939," and so forth?

A. Yes, I have.

Mr. Mason: May we have this statement marked as defendant's Exhibit No. 201 for identification?

The Court: It may be marked.

The Clerk: Defendant's Exhibit No. 201 for identification.

Mr. Mason: Did you prepare Exhibit No. 201 for identification, Mr. Herbert?

A. Yes, I did.

Q. And from what sources?

A. From the annual reports, for the various years shown [fol. 2836] and reported to the Public Service Commission of the State of Nevada by the Southern Pacific Company.

Q. Does this exhibit cover the same character of grade crossings and by similar segregations as shown on Exhibit No. 200?

A. Yes, it does.

Q. And, I take it, was prepared from a corresponding series of reports?

A. That is right.

Q. Are these figures taken directly from the reports themselves?

A. Yes, they are.

Q. Has it been checked against the reports?

A. Yes, it has.

Q. Does this include branch line or spur track crossings as well as main line crossings?

A. Yes.

Q. I take it that it includes only those crossings where the road or highway and the railroad track are on the same level?

A. That is right.

Q. Has the exhibit been checked to determine its correctness?

A. Yes, it has.

Q. Will you say whether or not it is a true and correct [fol. 2837] reflection of the underlying reports?

A. Yes, I believe it to be.

Q. Are the reports available?

A. Yes, they are.

Q. In the city?

A. Yes.

Mr. Mason: Have you any questions, Mr. Strouss?

Mr. Strouss: No questions.

Mr. Mason: We offer Exhibit No. 201 for identification as defendant's exhibit with that number.

Mr. Strouss: Objected to as irrelevant and immaterial.

The Court: The objection is overruled. It may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit 201.")

The Court: Refer to your Arizona exhibit for a moment. Where is it that you maintain the watchman on duty alone?

A. I believe at the crossing at Benson, but I am not certain as to that.

Q. I believe you stated that you didn't know how many of these crossings were on main line and how many on branch lines?

A. No, I don't have any such segregation shown.

[fol. 2838] Q. Do you recall the mileage—it is in evidence here somewhere—of the Southern Pacific Lines in the state of Arizona?

A. No, I don't recall that.

[fol. 2839] Mr. Mason: Exhibit No. 115 shows the operated steam mileage by states, your Honor.

The Court: All right, thank you.

Mr. Mason: And shows the total of all tracks including sidings, the Nevada total of all tracks including sidings and including the Western Pacific mileage of 177 miles over which we operate is 1231.43, column 10 of that exhibit. The Arizona grand total, all tracks including sidings, is 1702.49.

The Court: That would make a grade crossing every three miles, on the average. I was somewhat astounded as to the number of them.

Mr. Mason:

Q. Mr. Herbert, have you before you an exhibit in one sheet entitled, "Yuma, Arizona, to El Paso, Texas, Increased Investment in Siding Extensions Incident to Long Train Operation"?

A. Yes, I have.

Q. Did you prepare this statement?

A. Yes, I did.

Mr. Mason: May we have this marked No. 202 for identification?

The Court: It may be marked.

The Clerk: Defendant's exhibit No. 202 for identification.

[fol. 2840] Mr. Mason:

Q. Mr. Herbert, does this exhibit correspond to any exhibit previously offered and received of record here?

A. Yes, it does.

Q. Will you refer to that exhibit, please?

A. It corresponds to exhibit No. 197.

Q. Having exhibit No. 197 in mind, what steps have you gone through in preparing exhibit No. 202 for identification?

A. It was decided as testified by Mr. Sines and I believe the various dispatchers that certain sidings would necessarily have to be extended in order to comply with the program set out to make the redispatch. I set out to make the estimated amount of money required to extend those sidings.

Q. Have you shown here as items 1 to 48 and item 50 the stations in column B at which siding extensions are contemplated as indicated by exhibit No. 197?

A. Yes.

Q. And column C the milepost locations?

A. Yes, sir.

Q. What does column D indicate?

A. That indicates the present length expressed in feet.

Q. What does column E represent?

[fol. 2841] A. The present length expressed in car lengths.

Q. Is column E based upon any computation with respect to column D?

A. It is. It is an average of 46 feet per car. However, it is the exact figure as shown in the current timetable prevailing in 1938.

Q. Is column D based upon measurements or records in any particular office?

A. Yes.

Q. Where and what records?

A. They are based upon records in the chief engineer's office and also records in the division office here at Tucson.

Q. I notice here, for example, you show at Fortana a siding length and a corresponding length in cars. At Gael you show the siding length in feet as the same figure but the length in cars is shown as one car more?

A. Yes. However, that is due to the fact that the timetable had it that way and I show column E exactly the way the current timetable had it set up.

Q. Does the same explanation that you have just made as to the apparent disparity between lines 3 and 4 apply to any other cases where a similar or corresponding disparity appears?

[fol. 2842] A. Yes, I believe it will.

Q. For example, I notice in line 13 the siding of 3,946 feet is shown as having 77 cars while in the next line one only 30 feet shorter is shown as having four cars less capacity?

A. That is right.

Q. That disparity or inconsistency is between the actual record of length and the timetable showing?

A. Yes, sir.

Q. Between what points is the length in feet computed as shown in column D? Is that from switch point to switch point?

A. Yes, sir.

Q. The siding capacity in cars, does that depend upon any other features of the siding itself other than its length, switch point to switch point?

A. Yes, it does.

Q. What other feature, for example?

A. It depends upon the length in the clear. Many times although a siding might be 3,800 feet, for instance, there might be a spur or a derail at one end or the other of that siding that might impair its clearance and that derail is not always the same distance from the point of switch, thereby [fol. 2843] causing in one instance more cars for the same length of siding than another.

Q. Now as to proposed length in column F. How is that figured?

A. The length in column F is the proposed length expressed in feet for the various proposed lengths. In order to explain that I will be a little historical, maybe. It was decided by the chief engineer's office that in order to make a 70-car capacity siding it should be four thousand feet in length from switch point to switch point. That involves the following computation, 70 cars at 46 feet will equal 3,220 feet. Two hundred twenty-five feet was then provided at each end for clearance, making a total of 450 feet. An engine length and a caboose, taking an engine in this case of 126 feet, will be 166 feet. Then providing for an operating stop of 164 feet will total 4,000 feet.

Q. How do you get the additional length for 125-car sidings?

A. For all additional cars added thereto over the 4,000 feet an average length of 46 feet per car was provided. Therefore, taking the siding length of 6,530 feet as shown at Yuma or Fortuna, taking the 70 cars at 4,000 feet, add 55 [fol. 2844] cars at 46 feet per car, or 2,530 feet, will give you the 125 cars or the 6,530 feet.

Q. With the provision for the locomotive and caboose?

A. Yes.

Q. And the clearance?

A. And the clearance.

Q. And the operating stop that you mentioned?

A. Yes, sir. The same thing applies to the 100-car sidings except for the additional 55 cars you only have an additional 30 cars.

Q. Having obtained column F and column G in this manner, how did you obtain the figures in column H. For example, in line 2 you show a figure in column H in feet, what does that represent?

A. By subtracting the present length from the proposed length gives the length of the extension in feet.

Q. Did you make any personal inspection of the places at which the siding extensions were contemplated for the purpose of the redispatching study?

A. Yes, I did.

Q. What was the nature of your inspection.

A. In addition to my intimate knowledge of the territory involved, having worked, you might say, on the track for [fol. 2845] some fifteen or sixteen years in this territory, I made a special trip by track motor car or inspection car for the sole purpose of making this estimate.

Q. Did you stop at each of these sidings to determine whether an extension was practicable or not?

A. Yes, I did.

Q. You show in column I under the heading, "Length of Extension," the words "East or West." What does "East or West" as it appears in column I signify?

A. That signifies which direction the siding would be extended. I determined that on the ground from my own judgment as to whether the siding should be extended eastward or westward.

Q. What factors did you take into consideration in determining which direction the extension should be made?

A. There are many factors involved there, mostly those of practicability and economy. You take into consideration your grading, whether or not the switch points as proposed would be located on a curve or on a straight track, bridges and other obstacles that might be in the way in one direction or the other.

[fol. 2846] Q. If, for example, there were a rather high fill at one end of the siding and comparatively little fill at the other end, which direction would the extension be made?

A. I would take the end that involved the least cost and was the most practical. I would take the end that had the least fill.

Q. Suppose there were a wash or creek or arroyo at one end and no such natural feature at the other, which would you select?

A. I would take the one at the end that did not have that natural barrier.

The Court: Are any of these sidings shown on this exhibit No. 202 on which you propose to increase the length of the siding located on the Wellton-Phoenix route?

A. Not on the Wellton-Phoenix route.

Q. On the southern route east of here via Douglas?

A. Before I go to that, I thought you meant only the district between Wellton and Phoenix. On that route there is one called Topaz. As to the south line, there are none but there is on the double track which is on the former E. P. & S. W. line at Vail, which is on the westward main track.

Mr. Mason:

[fol. 2847] Q. Are these the same stations which are identified on exhibit No. 197 and no others?

A. That is right, the same ones.

Q. What type of rail did you contemplate for use in these siding extensions?

A. Second-hand ninety pound.

Q. You show in column H, "Miscellaneous Moving Pole and Pipe Lines and Other Structures." What does that signify?

A. That signifies the amount of money necessary for those items at the various locations shown.

Q. What moving of poles and pipe lines did you have in mind? Will you give me an example?

A. There are instances in extending tracks of moving switches where our telephone and telegraph poles or signal poles might be in the way and other pipe lines in towns or villages that might have to be moved in order to extend the side track and it also includes road crossings that might have to be crossed by the side track as well as the main track in its extended form.

Q. What does the item of "Grading" cover?

A. It covers all the grading necessary to extend the side track.

Q. Does that include whatever ballast might be necessary to replace?

[fol. 2848] A. No, it does not. Ballast is included in item J.

Q. Did you make any survey to determine the quantities of material that would have to be moved for the purpose of grading?

A. Yes, on the trip I just mentioned I made an on-the-ground survey at each place to determine the amount of grading and its cost per yard.

Q. How long did you take to make the inspection trip you have referred to?

A. It took about two weeks or over.

Q. As to track, how did you arrive at the figures in column J?

A. We have in the railroad a unit cost for track, that is bare track, including ballast, which I obtained from the chief engineer's office and which is in use in this territory and which I know to be correct and conforms to good engineering practices.

Q. Does it conform to your own experience?

A. Yes, it does.

Q. Is this the multiplication of the extension in feet by the unit cost per foot or per yard of track?

A. As far as the track, column J, that is correct.

[fol. 2849] Q. The column headed "Bridges," was it necessary to relocate, strengthen, or widen bridges for the purpose of these extensions?

A. It was necessary to widen certain bridges over which the side track would have to pass if extended.

Q. What as to the item of "Signals," how did you arrive at that and what does that represent?

A. Moving the location of a main line switch, which in each case would be involved here, it is also necessary to make certain adjustments in signals. Each switch is tied into the signal block layout.

Q. How do you obtain the cost figures for the movement of signals?

A. I worked in collaboration with the signal engineers of the company going over each item in detail and those were the figures that conformed to the latest estimates as to the moves that had to be made in each case.

Q. Are those based upon experience in the movement or removal or replacement of signal installation at sidings in this territory?

A. Yes, sir, they are.

Q. Based upon actual figures of record?

A. Yes, sir.

[fol. 2850] Q. Did you use work sheets in preparing exhibit No. 202 for identification?

A. Yes, I have work sheets.

Q. Which cover the details of each of these items?

A. Yes, they do.

Q. I take it that the total cost in column M is the summation of the costs which appear in the previous columns H to L, inclusive?

A. That is right.

The Court: How does it happen there is such a variance in the cost of track per foot ranging in line 24 at Vail of $3.22 to $10.21 at Raso, line 33?

A. That is due, as you will note, at Raso you have an extra heavy bridge expense, where at Vail you have only twenty dollars, at Raso you have $4,400. Going to the next item in column I, signals, at Vail the expenditure for signals was only forty dollars, whereas at Raso an expenditure of $3,400 was necessary and so on through the general cost items.

Mr. Mason:

Q. At Vail I take it you made the extension away from the existing signal mast at the opposite end of the siding?

A. Yes, there was no signal mast at the switch that I [fol. 2851] chose to extend at that point.

Q. Is that because that track is used in one direction only?

A. Yes.

Q. And the track at Raso is used for both east and westbound, is it?

A. Yes, sir.

Q. I take it that the figures in column N are obtained by division. Will you state what items are used in that division?

A. They are the cost per track foot. It is the track feet of the extension, which would be column H, dividing the cost, the total cost into column M.

Q. It would be column M, dollars, divided by column H, feet?

A. Yes, sir.

The Court: We will take our noon recess at this time until two P. M.

(Thereupon the court stood at recess until two o'clock P. M. this day, January 23, 1941.)

[fol. 2852] January 23, 1941, two o'clock P. M.

Proceedings were resumed at this time as follows:

The Court: Gentlemen, before we commence, time drags heavy on my hands at times. I wonder if you would have any objection if the Court saw fit to personally visit the dispatcher's office in Tucson just to see at first hand how it operates?

Mr. Strouss: No, we haven't.

Mr. Booth: We certainly have not.

The Court: I am sure the dispatcher here would be willing to show me the office.

Mr. Strouss: It would be perfectly all right with us.

The witness, W. P. Herbert, was recalled to the stand and testified further as follows:

Mr. Mason: Taking up Exhibit No. 202 for identification again, Mr. Herbert, I take it that line 51 showing the totals are simply a summation of the total in line 49 plus what you show for the Phoenix Line to Topaz?

A. That is right.

Q. And the total in line 49 is simply a summation of the items appearing above?

[fol. 2853] A. Yes, sir.

Q. Now, you show in line 52 an item for contingencies with the factor "plus ten per cent" mentioned; the ten per cent is applied to what figure?

A. It is applied to the total in line 51, column M.

Q. Why do you add that allowance? Is that an actual expense?

A. No, that is a percentage that is usually, in fact, invariably added to estimates of this nature.

Q. In your experience as assistant engineer on the Tucson division, have you calculated the cost of projected changes or improvements?

A. Yes.

Q. Frequently?

A. Yes, quite frequently.

Q. Was that part of your duties as assistant engineer?

A. Yes.

Q. And have you in the calculations represented by Exhibit No. 202 followed the same methods and practices?

A. Just about the same, yes.

Q. Including the inspection on the ground?

[fol. 2854] A. Yes.

Q. Now, does this item in line 52, is that one which you added in making your other estimates or plans?

A. Yes, the same percentage figure is always added, ten per cent for contingencies.

Q. Now, did you yourself make the selection of the points at which the siding extensions were to be constructed or were those the points given to you by Mr. Sines or others?

A. They were agreed upon by Mr. Sines and the dispatchers and given to me.

Q. Mr. Herbert, are the costs represented on Exhibit No. 202 the costs as of 1938, or as of 1940, or 1941?

A. They represent the cost as reflected by prices prevailing in 1939.

Q. Do you know and, if so, will you state whether there has been any substantial or material variation as between 1938, 1939, and 1940, in so far as these particular items are concerned?

A. There isn't any substantial variation.

Mr. Mason: Have you any questions, Mr. Strouss?

Mr. Strouss: Yes.

Q. You say that this inspection was done as you ordinarily do in your practice of estimating for the improve-

[fol. 2855] ments on the road?

A. Yes.

Q. Do you ordinarily inspect 125,000 feet of extension in locating 50 different points in two weeks?

A. No, if we were going to do it in two weeks we would make the inspection, yes.

Q. And get all the data that is necessary for an estimate?

A. Yes, sir.

Q. Now, these costs per track foot, what did you say that represents?

A. That is just a calculation made on the face of this exhibit, showing the amount of money shown in column M, which is the total cost divided by the proposed extension.

The Court: Column H.

A. Column H.

Mr. Strouss: It is not the unit then that is used to arrive at the cost?

A. No, no, these units were developed here from the cost figures and just shown on there as a matter of information.

Q. I understood you to say that the reason that this unit of $10.21 is so high is because of the bridge and signal cost there?

[fol. 2856] A. Yes, as compared with the smaller cost at Vail, which the Court asked about.

Q. I notice at Lordsburg yard, the cost per track foot is $5.05 with practically the same bridge and signal cost at Raso.

A. Yes, but the track footage of extension is a whole lot greater, therefore making a smaller average per foot.

Q. These costs were based upon labor, material, and everything that enters into it as of 1939 cost?

A. Yes, sir.

Mr. Mason: We offer the exhibit in evidence as defendant's exhibit No. 202.

Mr. Strouss: It is objected to as an opinion and conclusion of the witness.

The Court: The objection is overruled. It may be admitted.

(Thereupon the document referred to was received in evidence and marked, Defendant's Exhibit No. 202.")

Mr. Mason: For the sake of convenience, if your Honor please, I should like to withdraw Mr. Herbert at the present time in order to present another witness from out of the city.

The Court: There is another question the Court would like to ask of Mr. Herbert.

[fol. 2857] Mr. Mason: Yes.

The Court: Refer back a moment to exhibit No. 200, Mr. Herbert. I notice that in the ten-year period shown on the exhibit covering the years 1930 to 1939, there has been a

reduction in the number of grade crossings to the extent of 82, that being the difference between 654, the figure shown in column F, and the corresponding figure shown in column .

Q. Would we infer from that that by underpasses or overpasses 82 of these crossings have been taken care of, or have some of them been entirely eliminated?

A. Some have been influenced by the construction of grade separations which you refer to as overpasses or underpasses, and others have been just entirely eliminated, some through abandonment of branch lines, some others eliminated as unnecessary crossings. The railroad is always trying to get rid of unnecessary road crossings.

Q. Are you familiar with the lines in Nevada?

A. Not as much as I am in Arizona. I have been over them many times.

Q. Isn't it true that comparing Exhibit 200 with No. 201, that Arizona has proportionately altogether more grade crossings than does Nevada as based on the total mileage? [fol. 2858] A. Yes, I believe so, I haven't made that calculation, but I believe you are right.

Q. How would you account for that; does the fact that the territory through which you run in Arizona is more thickly populated, more towns than you find in corresponding territory in Nevada account for it?

A. I believe that is the principal cause, and more grade crossings per mile.

Q. Well, those crossings come as a result of need, do they not?

A. Yes.

Q. As a result of roads that may exist?

A. Yes.

The Court: I think that is all.

Mr. Mason: Mr. Herbert, does the relocation of roads have anything to do with the elimination of grade crossings?

A. Yes, the highway department in the state both in Nevada and also in Arizona have entered upon a campaign in recent years to eliminate unnecessary grade crossings, particularly on their main highways in the state. Not only do they eliminate them by grade separations but by highway line changes, and they have done considerable work in both states in that respect.

[fol. 2859] The Court: Take Highway No. 80 that traverses northern Arizona here, how many times does that

main highway cross your main lines, where there is not either an underpass or overpass?

A. In the state of Arizona?

Q. Yes. Are there any such crossings?

A. I don't believe there are any such at this time on that particular highway where it is necessary to cross at grade.

Q. In other words, a tourist could go through the state of Arizona on that highway without crossing your road, the main line?

A. There might be some spur tracks that might still be at grade, but I believe the main tracks are all provided with grade separations at this time.

The Court: If there are no further questions, you may step aside. Call your next witness.

Mr. Mason: Before the witness is called, there is certain information from our profiles which we have worked up at Mr. Strouss' request, and I now furnish it to him, and I ask also, with the concurrence of Mr. Strouss, that this information may be copied into the record at this point. Will that be satisfactory to you, Mr. Strouss? This was worked up for you from the profile.

[fol. 2860] Mr. Strouss: Yes, I didn't understand that this is the information that I was receiving. It is all right if you want to put it in. I have no objection to its going in.

Mr. Mason: Well suppose that we have it copied into the record at this point. You have no objection to its appearing as a truthful statement of record?

Mr. Strouss: No. I haven't examined it. I don't mean to say that I don't think it is a true statement.

Mr. Mason: Well, subject to any check you may have, then.

Mr. Strouss: My understanding from Mr. Sines was that he had some information already worked up, which he would let me have to see if it wouldn't answer the purpose I had in mind.

Mr. Mason: This is some of that information, and I think he has some more that he is preparing to work up, but he isn't certain of just what you want. Perhaps, if you will, advise him——

Mr. Strouss: Is this going in as part of Mr. Kirkbride's testimony? If you are putting this in as part of your evidence, I would want it connected with some witness so

when I come to cross-examine I would know what I am [fol. 2861] cross-examining about.

Mr. Mason: Well, we will furnish you the information then—well, I did want to have it a part of the record.

The Court: You might have it marked for identification, and have it introduced when Mr. Kirkbride returns.

Mr. Mason: No, it was prepared by Mr. Sines from the profiles in order to furnish the information for Mr. Strouss.

Mr. Strouss: Of course, that is not an accurate statement. It is not—I think Mr. Sines will agree with me that I was having some difficulty in getting the information I wanted off the profiles, and asked him to give it to me, and he told me he had some figures that would help me get the information I want; and would give that to me for my inspection to see whether it gave me the information I was trying to get off the profiles.

The Court: In other words, the information itself is already in the record by exhibit or otherwise?

Mr. Strouss: No.

Mr. Mason: No, I don't think it is. Suppose we reserve the offer for the record until you have had a chance to ex- [fol. 2862] amine it, then we may be able to stipulate to put it in.

[fol. 2863] Mr. Booth: Call Mr. Browning.

Arthur C. Browning was called as a witness in behalf of the defendant and being first duly sworn testified as follows:

Direct examination.

By Mr. Booth:

Q. Will you state your name and residence?

A. Arthur C. Browning, Chicago, Illinois.

Q. What position do you occupy with the mechanical division of the Association of American Railroads?

A. I am secretary.

Q. How long have you been secretary?

A. Since January 1, 1941.

Q. Previous to your appointment, what position did you occupy?

A. Assistant to the secretary.

Q. Since what date?

A. Since July, 1919.

Q. Beginning with 1932, did you have anything to do with the interchange rules of that division?

A. Yes, sir, I have edited the interchange rules since the starting of 1932 up to the present time.

[fol. 2864] The Court: What do you mean by "interchange rules," Mr. Browning?

Mr. Booth: We will introduce this in evidence, your Honor, in just a moment. You may answer the question.

A. The rules governing the interchange of cars between railroads.

Mr. Booth:

Q. Have you occupied any position during that ten years with the arbitration committee of the association?

A. Yes, sir, I have acted as secretary of the arbitration committee.

Q. What, briefly, is the arbitration committee?

A. The arbitration committee has jurisdiction over these rules, that is, they recommend any changes that they think are necessary in the rules from time to time as well as arbitrate disputes between the members in connection with the rules.

Q. To what body, if any, are those recommendations submitted?

A. The recommendations of the arbitration committee are submitted in annual reports to an annual meeting of the division and are acted upon at the annual meeting.

Q. And the division is composed of what members, generally?

[fol. 2865] A. Composed of railroad members of the United States, Canada, and Mexico.

Q. Did you act during that period as secretary of the committee on prices for labor and materials?

A. Yes, sir, I did.

Q. Has that committee any jurisdiction over recommendations for changes in the rules?

A. Yes, sir, particularly those rules dealing with the prices for labor and materials that are charged for repairs to cars.

Mr. Booth: I have handed the clerk a printed book consisting of 343 pages including the five-page index, the title

page of which reads, "Association of American Railroads, Code of Rules Governing the Condition of and Repairs to Freight and Passenger Cars for the Interchange of Traffic, Adopted by the Association of American Railroads, Operations and Maintenance Departments, Mechanical Division, Effective January 1, 1941, Revised 1940, Published by Association of American Railroads, 59 East Van Buren Street, Chicago, December, 1940." I ask that this be marked defendant's exhibit No. 203 for identification.

The Court: It may be marked.

The Clerk: Defendant's exhibit No. 203 for indentification.

[fol. 2866] Mr. Booth:

Q. Mr. Browning, what is exhibit No. 203 for identification?

A. It is the current code of the book commonly known as the "A. A. R. interchange rules."

Q. Are those rules in whole or in part adopted or promulgated by the Interstate Commerce Commission?

A. No, sir, they are not.

Q. They are filed with the Commission as a matter of information, are they not?

A. Yes, copies are furnished to the Interstate Commerce Commission and also the Railway Commission of Canada as a matter of information.

Mr. Booth: I think that clears up the question that came up on the examination of Mr. Leriche earlier in the case.

The Court: There was an objection to certain of his testimony on the ground that the record was the best evidence as to these rules?

Mr. Booth: Yes, but also he was under the impression, though not a very strong impression, that these rules were adopted by the Interstate Commerce Commission and I said I would clear that up later.

The Court: I see.

Mr. Booth:

Q. Mr. Browning, will you state in general what this book [fol. 2867] of rules, exhibit No. 203 for identification, covers?

A. That is published in the rules themselves in the preface on page 10.

Q. Will you read that into the record?

A. (Reading) "Preface. These rules are formulated as a guide to the fair and proper adjustment of all questions arising between car owner and handling company with the intent of

1. Making car owners responsible for and therefore chargeable with the repairs to their cars necessitated by ordinary wear and tear in fair service; by the safety requirement and by the standards of the Association of American Railroads.

2. Placing responsibility with and providing a means of settlement for damage to any car, occurring through unfair usage or improper protection by the handling company.

3. Providing an equitable basis for charging such repairs and damages."

Q. What rule, if any, governs the obligation of a company to accept or its privilege of rejecting a car offered in interchange which does not conform to these rules?

A. Rules 2 and 3 are directly associated with that question. Rule 3 contains the requirements to which cars must [fol. 2868] conform to render them acceptable in interchange or from the car owner.

The Court: If a New York Central freight car, for instance, were being carried over the Southern Pacific Company lines and a wreck occurred damaging that car, upon whom would the loss for repairs fall?

A. It would probably fall upon the handling line. There are certain conditions—I don't know exactly what you mean by "wreck"—if there is a derailment, there is no question, it is the handling line. Rule 32 states the conditions which are considered unfair usage and which are the responsibility of the handling line.

Q. In his Honor's question the handling line would be the Southern Pacific Company?

A. Yes, sir.

Q. You stated that these recommendations are adopted or passed upon either favorably or unfavorably by the annual meeting following the submission of the recommendations, is that correct?

A. That is right, the report is presented and passed upon at the June annual meeting each year.

Q. Each year since 1911 at least has a book of rules similar to exhibit No. 203 for identification been issued and distributed by the association?

[fol. 2869] A. That is correct.

Q. Have you here in the courtroom each of those books from and including the year 1911 to an- including exhibit No. 203?

A. I have them in booklet form for all except one year and that year they were published in the proceedings for the year 1915.

Q. Have you at the Pioneer Hotel in this city a trunk containing the proceedings of the annual meetings at which these rules were adopted?

A. Yes, sir, the master car builders proceedings up to 1919 and then it was the American Railway Association.

Mr. Strouss: It was then changed to Association of American Railroads?

A. Yes.

Mr. Booth: We will make these books present in the courtroom available to counsel and inasmuch as the witness and counsel are stopping at the same hotel we will ask that they be made available to counsel at the hotel.

Mr. Strouss: I think we can arrange that.

Mr. Booth:

Q. Mr. Browning, have you prepared an exhibit showing the chronological history of certain rules relating to air brakes, axles, brake beams, brake beam hangers, couplers, draft gears, trucks, underframes, and wheels as they appear [fol. 2870] in the series of rule books from 1911 down to exhibit No. 203 for identification?

A. I have.

Mr. Booth: We have this in typewriting and I would like to file a copy of this exhibit as defendant's exhibit No. 204 for identification with the privilege, if it is admitted in evidence, of substituting a photostatic copy in more convenient form.

The Court: If it is admitted, the substitution may be made.

The Clerk: Defendant's exhibit No. 204 for identification.

Mr. Booth: I have purposefully refrained from offering this book of rules in evidence. I would like to have it remain with the clerk with the understanding that either side may either during its own case or at any other time copy and offer in evidence any rule from this exhibit No. 203 for identification. I would just as soon have the entire book go in evidence, but in order not to encumber the record——

Mr. Strouss: That is agreeable to me. I would have no objection to the introduction of the book itself in evidence and I agree with Mr. Booth that only those parts which [fol. 2871] are pertinent or desired by either side should be part of the record as evidence.

The Court: The record may show the stipulation. The exhibit will be marked merely for identification, but either the plaintiff or defendant may extract therefrom any pertinent excerpts which they deem necessary to present their view of the case.

Mr. Booth: I assume it may also be done by reading a rule to a witness in the course of a witness' examination?

Mr. Strouss: Yes, that is agreeable.

Mr. Booth: Instead of introducing the rule as an exhibit?

The Court: Yes.

Mr. Booth:

Q. Taking up the first subdivision of exhibit No. 204 for for identification, Mr. Browning, does this show that there was in the rule book of September 1, 1911, rule 53 relating to the character of air brakes which should be present on freight cars offered in interchange?

A. Yes, sir, it does.

Q. Then does it show on that page and on the ten pages succeeding that page, that is, up to and including page 11, the successive changes in that rule relating to air brakes [fol. 2872] until they culminated in the present rule which is in exhibit No. 203 for identification?

A. Yes, sir.

Q. Those changes year by year are shown, are they not, in the rule books which you have here in the courtroom as

well as in the proceedings of the association by which the rules were adopted?

A. They are shown in the book of rules which we have here. They are not all published in the proceedings. They were only published in the proceedings I believe up to 1917 and after that just the individual book was issued.

Q. By the way, how large a distribution has this book of rules?

A. At the present time we print close to sixty thousand copies and they are practically all distributed, all railroad companies in the United States, Canada, and Mexico, as well as private car lines, naturally have to have copies of them.

Q. Are all Class I railroads in the United States parties to these rules?

A. Parties to the freight car rules, yes, sir.

Q. Are all or practically all private freight car companies also parties to the rules?

A. That is correct.

[fol. 2873] Q. Is the list of subscribers to the freight car rules given, beginning at page 277 of exhibit No. 203 for identification?

A. Yes, sir, 277 to 305, inclusive.

Q. That includes the Southern Pacific Company and the Pacific Fruit Express Company?

A. Yes, sir.

Q. What classes of private car owners are listed; name some of the private car owners that are parties to these rules?

A. The Armour Car Lines, Union Tank Car Company, Pacific Fruit Express——

Q. (Interrupting) I don't mean by name but by character of car.

A. They are mostly tank cars or refrigerator cars or special cars of some different types, like some of these covered hoppers or poultry cars, but the majority of them are either tank cars or refrigerator cars.

Q. They are non-railroad owned cars?

A. Yes, sir.

Q. Do they have cars to transport wine?

A. Yes, sir.

Q. Milk, vinegar, and molasses?

A. Yes.

Q. Turning to exhibit No. 204 for identification, to the [fol. 2874] subdivision thereof entitled "Axles," was there any rule prior to October 1, 1915, relating to the axle equipment of cars that would be acceptable in interchange?

A. No, sir, there was no rule as to the type of axles required on cars in interchange service prior to October 1, 1915.

Q. The rule then adopted is shown near the top of the first page of the section of this exhibit headed "Axles," is it?

A. That is correct.

Q. And the latest amendment to that rule was effective January 31, 1939, and is shown on the fourth page of that section, is that correct?

A. That is correct.

Q. Turning to the next section headed "Brake beams," was there any rule in interchange prior to October 1, 1914, relative to the class of brake beams on cars that would be accepted in interchange?

A. No, sir.

Q. Is the rule which was adopted on October 1, 1914, shown near the top of the first page of the section headed "Brake beams"?

A. That is correct.

Q. Is it correct that the rule as it exists today was adopted on August 1, 1937, and is shown on page 7 of that [fol. 2875] section—January 1, 1939, I should say, effective as of that date?

A. Yes, sir, that is correct.

Q. Between the original adoption of the rule and its amendment in 1939, there are a number of changes as shown in that section?

A. Yes, sir.

Q. Turning to the next section, "Brake beam hangers," was there any rule prior to January 1, 1930, relative to brake beam hangers and brake beam hanger pins?

A. There was no rule as to the type of brake beam hangers or pins required on cars in interchange.

Q. The rule was adopted for the first time effective January 1, 1930, was it?

A. That is correct.

Q. The latest rule as shown on page 2 of that section was adopted when?

A. January 1, 1938.

Q. Turning to the next section headed "Couplers," was there any interchange rule in effect from September 1, 1911, to October 1, 1914, with respect to the type of couplers required on cars in interchange?

A. No, sir.

[fol. 2876] Q. When was the coupler rule first adopted?

A. Adopted effective October 1, 1914.

Q. And shown in this section of the exhibit, is that correct?

A. That is right.

Q. And the latest rule on the subject is shown on page 7 of that section, is that correct?

A. That is correct.

Q. When was the latest rule on the subject of couplers adopted?

A. There was an extension of the effective date of August 1, 1940, paragraph C-11, extended to January 1, 1942, on August 1, 1940.

Q. So the rule as to couplers adopted August 1, 1938, and shown on page 6 of that section of the exhibit will be in effect a year from now, January 1, 1942, is that correct?

A. That is correct, yes, sir.

Q. And the rules preceding that are shown on this exhibit?

A. That is correct.

Q. Turning to the section of the exhibit headed "Draft gear," was there any interchange rule in effect prior to January 1, 1934, relative to draft gears?

A. There was no rule as to the type of draft gears re-[fol. 2877] quired on cars in interchange prior to January 1, 1934.

Q. The rule effective January 1, 1934, is shown near the top of the first page of the section headed "Draft gears"?

A. Yes, sir.

Q. And the rule at present in effect was adopted when?

A. Effective August 1, 1937, was the last revision.

Q. That is shown on page 1 and the first three lines of page 2 of that section of the exhibit?

A. Yes, sir.

Q. Did the interchange rules in effect from September 1, 1911, to January 1, 1928, contain any provision with respect to the type of trucks required under cars in interchange?

A. No, sir.

Q. When was the rule first adopted with respect to trucks on such types of cars?

A. Effective January 1, 1928.

Q. Is that shown near the top of the section of this exhibit headed "Trucks"?

A. Yes, sir.

Q. When was the rule now in effect adopted with respect to trucks?

A. The last revision was effective January 1, 1941.

[fol. 2878] Q. And that is shown near the bottom of page 6 and the first four lines of page 7 of that section of the exhibit?

A. That is correct.

Q. Turning to the section of the exhibit headed "Underframes" was there any rule in effect with respect to underframe requirements on cars in interchange prior to January 1, 1927?

A. No, sir.

Q. Is the first rule effective January 1, 1927, shown near the top of the section headed "underframes" in this exhibit?

A. Yes, sir.

Q. Please refer to that section of the exhibit and state what the present rule, the rule now in effect is with reference to underframes?

A. The last modification was effective January 1, 1940, and after that there was an extension of effective date of the requirement in one paragraph to January 1, 1942. That extension was made on August 1, 1940.

Q. The last section of this exhibit is headed "wheels." Was there a provision in the interchange rules with respect to the types of wheels required on cars in interchange prior to January 1, 1925?

A. No, sir.

[fol. 2879] Q. And is the rule which was made effective January 1, 1925, shown in the upper half of the first page of the section of the exhibit headed "Wheels"?

A. Yes, sir.

Q. By the way, there is a peculiar section which I wish you would explain. It says, "A car will not be accepted in interchange if any of its wheels have the letter 'C' chipped out of the legend 'M. C. B.' or the letter 'R'

chipped out of the legend 'A. R. A.'" Why was it necessary to put in that rule?

A. And the present rule says, "A. R. A. or A. A. R.," which means the same thing. In the manufacture of wheels, they are not permitted to stamp the letters "M. C. B." or "A. R. A." or at present "A. A. R." on the wheel, unless it meets the specification of manufacture, but in casting them, those letters are cast on it, then in the inspection, if the inspector finds the wheel doesn't meet the specification, he chips the letter "C" out or the letter "R" out and that indicates to any railroad inspector that the wheel doesn't meet the A. A. R. specification.

Q. The M. C. B. stands for what?

A. That was the Master Car Builders' Association.

[fol. 2880] Q. That was the predecessor of your present association?

A. Yes, that was the Master Car Builders. In 1919 it became the American Railways Association, A. R. A., which is now the American Association of Railroads, A. A. R.

Q. You say when the inspector finds it not up to standard. Who employs the inspectors?

A. The railroads or the purchaser of the wheel. It might be a private car line. There are various methods, some concerns hire inspectors of certain Bureaus to do this inspecting. They make a practice of visiting the foundries and inspecting the wheels, like the Hunt concern in Chicago is one of them, the Pittsburgh Casting Laboratory is another one that has inspectors for that purpose that are subject to hire by different railroads or private car owners purchasing wheels.

The Court: Mr. Browning, the exhibit 204, about which you have testified, has to do wholly with the rules governing freight cars?

A. That is right.

Q. Whereas, the exhibit 203, that covers both the freight and passenger cars?

A. Yes, sir.

Q. I take it, then, Mr. Browning, that it behooves the owner of any car, railroad car, that he expects to be put into general use in traffic, to have that car conform to these requirements, or else any connecting carrier might refuse to accept them?

A. That is correct.

Mr. Booth: Well, generally speaking, in what circumstances may a connecting carrier repair the car of another carrier?

A. Well, if there are any defects which require repairs as a result of damage or wear, or even unfair usage, in connection with the safety of the car or the safety of the lading to be loaded in the car he can make the repairs.

The Court: Is there any time limit, Mr. Browning, under these rules within which a car must be returned to the owner?

A. No, sir.

Q. In other words, for illustration, a car from the New York Central might leave those lines and not return to it for a year or two?

A. Yes, sir.

Q. Does that frequently happen?

A. Well, I don't think, not for that period of time, but it is not unusual for a year of two for a car to be away from [fol. 2887] home. Of course, it is earning per diem all that time.

Mr. Booth: The railroad that is using the car pays the railroad that owns the car a certain per diem for the use of the car?

A. That is right.

The Court: Any needed repairs that were due to wear and tear would be chargeable to the owner?

A. That is right.

Mr. Booth: That matter of car supply and the regulation of per diem charges and related matters is under the car service division of the Association of American Railroads, is it not?

A. The operating transportation division have authority over the per diem rules, and the car service division over the car supply.

Q. Something with which your division has nothing to do?

A. No, sir.

Mr. Booth: Any questions on Exhibit 204, Mr. Strouss?

Mr. Strouss: No, I have no questions.

Mr. Booth: We offer Exhibit No. 204 in evidence, Your Honor.

Mr. Strouss: No objection.

The Court: It may be admitted.

(The document referred to was received in evidence and [fol. 2883] marked, "Defendant's Exhibit No. 204.").

Mr. Booth: Are there any questions, Mr. Strouss?

Mr. Strouss: You mean on cross-examination?

Mr. Booth: Yes.

Mr. Strouss: I would prefer to defer my cross-examination until I have looked at these other books this evening.

Mr. Booth: Mr. Browning has an appointment in Montreal next Tuesday, a meeting of the Association, and if you could examine him tomorrow morning so that he could catch that eleven o'clock train out, he would be very much obliged to you.

Mr. Strouss: I think I can do that.

Mr. Booth: You are both at the same hotel, and if there is anything you want in the way of information from the files he has with him, which I think are complete, you can arrange for that after adjournment.

Mr. Strouss: Yes.

The Court: Mr. Browning, would it be profitable, or is it done by any of the roads, to actually construct more cars than they themselves might need in their business, with the thought that these cars might be scattered over other systems and used by them?

[fol. 2884] A. Now, your Honor, that is a question of policy of the railroads. Some roads do, or, rather, some roads are lending roads and some are borrowing roads.

Q. So far as cars are concerned?

A. Yes, sir.

The Court: You may step aside. We will take our mid-afternoon recess at this time.

(Thereupon a short recess was taken, after which proceedings were resumed as follows:)

The Court: You may proceed.

W. P. HERBERT was recalled to the stand and testified further as follows:

Direct examination (Continued).

By Mr. Mason:

Q. Mr. Herbert, will you refer to Exhibit 202, please? I think you stated in your direct examination that you spent approximately two weeks on an inspection trip for the purposes of making the study which led to this exhibit?

A. Yes, that is right.

Q. Does that two weeks represent all of the time you spent in making the study and the calculations which en-
[fol. 2885] tered into the making of this exhibit?

A. No, it didn't. I spent several months doing the entire job and making the estimates.

Q. Did you gather the truck and station plans at the various stations for the purpose of studying the work to be done?

A. Yes, from the records that I have at my office. Such estimates as these in most cases can be made without any field investigation. However, the field investigation was made as more of a check than anything else.

Q. Does the exhibit represent as well the result of your knowledge gained from your sixteen years on the division?

A. Yes, sir.

Q. Have you before you a statement in a single sheet bearing the title "Yuma, Arizona, to El Paso, Texas, Increased Investment in Water, Round House and Shop Facilities Incident to Adoption of Long Train Program"?

A. Yes, I have.

Mr. Mason: May we have this statement marked, if your Honor, please, Defendant's Exhibit 205 for identification?

The Court: It may be marked.

[fol. 2886] The Clerk: Defendant's Exhibit No. 205 for identification.

Mr. Mason: Did you prepare defendant's exhibit No. 205 for identification, Mr. Herbert?

A. Yes, I did.

Q. Does it represent largely your own work rather than preparation from records?

A. It is preparation from my own work and from records.

Q. What type of records, and what records did you use for the purpose?

A. Well, we have standard plans of the various facilities that are to be installed as shown on this exhibit; and prices for those various facilities, in collaboration with the chief engineer's office, working together on it, we were able to estimate in each case the amount of money required.

Q. Does this represent another type of construction with which you are familiar?

A. Yes, sir.

Q. Now, will you refer, please, to the exhibit itself and, first, to block No. 1. Just what construction or reconstruction did you study in connection with Block No. 1?

A. Block No. 1 shows the amount of money necessary to extend five stalls and pits 65 feet at Yuma and Tucson; [fol. 2887] and build seven new stalls and pits to the roundhouse over the existing roundhouse tracks at El Paso.

The Court: That would be to take care of these larger and longer locomotives and trains that you refer to?

A. Yes, that is the purpose of the exhibit: to take care of the larger power that would be necessary.

Mr. Mason: Did you make a study of the existing facilities at Tucson, Yuma and El Paso, preparatory to this study?

A. Yes.

Q. Did you prepare plans for the construction which would be required if the facilities were to be fitted to the newer and larger power?

A. I had plans prepared for that purpose.

Q. Now, as to Item No. 2, what does that represent?

A. Block No. 2 shows the cost to install 126-foot turntable at Yuma, and Tucson, to replace existing 100-foot turntable.

Q. Why would turntables 126 feet long be necessary in place of 100-foot turntables?

A. Because the A.C. power as contemplated on the redispatching studies requires a turntable of that length. [fol. 2888] Q. Are turntables of that length in use on those districts where A.C. power is now in use?

A. Generally, yes, where they turn the engines on the turntable.

Q. Are these engines sometimes turned by the use of Y's instead of turntables?

A. Yes, sir.

Q. Is a Y a practical installation where you have to roundhouse engines?

A. No.

Q. From what sources were the cost figures for item No. 2 taken?

A. They were taken from the same sources as explained in No. 1, from our various standard plans that we have for such work and from field investigation.

Q. Have you studied or confirmed the results of the cost figures as applied here, from your own experience?

A. Yes, I have.

Q. Now, what as to Item 3?

A. Item 3 shows a transfer of the T. & N. O. erection shop to Pacific Lines property at El Paso, Texas. That T. & N. O. erection shop is a building that is not now [fol. 2889] used, but has certain machinery in it at El Paso which would be transferred to another location where it could be used and would be used for this larger power.

The Court: Does that refer to Texas and New Orleans?

A. T. & N. O. means Texas and New Orleans, yes, sir.

Mr. Mason: Is this a structure now at El Paso which would be transferred and thereafter necessarily used in the servicing of the AC-8 locomotives?

A. Yes, sir.

Q. Now, why do you transfer the T. & N. O. erection shop instead of building a new building at the location where you desire to have the installation for the servicing?

A. Because at El Paso at the present time we have now a 126-foot turntable at the location where those engines are now turned, and where the principal shops are located for servicing those engines used east of El Paso at the present time. Therefore, it is necessary that other engines, if assigned to the territory between Tucson and El Paso would be also turned on that turntable rather than building another one.

Q. Does this represent a lesser expense than to build [fol. 2890] a new building or build a new turntable at the present location of the erection shop?

A. Yes, it would be a lesser expense.

Q. What does Item 4 represent?

A. The installation of an additional water column and a 65000-gallon water tank at Benson, Arizona, that being necessary in order to pass long trains at that point.

Q. Then in connection with this exhibit it should be understood, should it, that the item covering the location of the water column and tank is at Benson opposite Item 4 and as indicated by column D?

A. That is right, yes.

Q. Why would these additional water supply facilities be necessary at Benson?

A. At the present time, the water columns at Benson wouldn't be a sufficient distance apart to permit the train standing on the side track, a long freight train standing on the side track, to take water without cutting the train in half and pulling back. So it was, therefore, necessary to provide this additional water column.

Q. What about the additional gallonage capacity, a 65000-gallon tank?

A. The tank was also deemed necessary. We figured it was cheaper to build a tank up near the new column rather [fol. 2891] than to build an expensive pipe line, which would necessarily have to be around a ten-inch line. It was cheaper to build a second-hand 65000-gallon watertank than to build a pipe line for the distance it would have to be built from the present water supply.

Q. You were faced with the choice of building another tank or of extending the pipeline from the present water storage tank to the new water columns?

A. That is right?

Q. And this is the cheaper alternative, is it?

A. Yes, it is.

Q. Have you yourself personally gone over these figures to determine whether they truly and correctly represent substantially the cost of bridges built or installing these particular facilities?

A. Yes, I have.

Q. Will you say whether or not, according to your information and experience, they are true and correct?

A. Yes, they are.

Q. Are these costs as of the year 1938 or the year 1946, or some other period?

A. They represent, as in the exhibit I previously put in, No. 202, costs and prices as of 1939.

[fol. 2892] Q. Will you say whether or not the 1939 costs and prices are fairly representative of those in 1938 or 1940?

A. Yes, they are.

Mr. Mason: Have you any questions, Mr. Strouss?

Mr. Strouss: Items 3 and 4, where you contemplate the use of second-hand or used materials, what about items 1 and 2, are there any second-hand materials contemplated in those instances?

A. No; the 126-foot turntables are all new as well as the roundhouse pits installed would have to be new.

Mr. Strouss: That is all.

The Court: Well, Item No. 3 really consists, then, of a purchase in part?

A. Yes, it would have to be taken from the T. & N. O. and transferred to another railroad; it would be the same thing as purchasing second-hand material.

Q. Is the Texas and New Orleans a subsidiary of the Southern Pacific?

A. Yes.

Mr. Mason: Do I understand that there is any cost of material, or is this all the cost of labor in Item No. 3.

A. Well, Item No. 3 is principally a labor item in the [fol. 2893] whole. I possibly was wrong in saying that it was a purchase, it is just a transfer from one property to another.

Mr. Mason: Have you any further questions, Mr. Strouss?

Mr. Strouss: No questions.

Mr. Mason: We offer the exhibit in evidence as defendant's Exhibit No. 205.

Mr. Strouss: Objected to as irrelevant and immaterial, and as calling for a conclusion.

The Court: The objection is overruled. It may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 205.")

Mr. Mason: Do your wish to cross-examine Mr. Herbert now, Mr. Strouss?

Mr. Strouss: I had better take Mr. Baker first.

Mr. Mason: Very well.

The Court: Step aside. Call your next witness.

Mr. Mason: I will ask Mr. Baker to resume the stand.

[fol. 2894] G. C. Baker was recalled to the stand and testified further as follows:

Cross-examination.

By Mr. Strouss:

Q. Mr. Baker, referring to exhibit No. 196, which items of the redispatching study did you participate in?

A. Item No. 1.

Q. Item No. 1. What about Item No. 4?

A. No, I didn't participate in that study.

Q. Now, that was the redispatching study of Yuma, Arizona, to El Paso, Texas, excluding the Phoenix line, June and August, 1938, Freight Operations?

A. That is right.

Q. And, as I understand it, you took the traffic which was on hand on the first day of each of those months and the traffic that was received at Yuma during the period, and the traffic which originated at Yuma during the period, and that was the traffic which you redispatched?

A. Yes, sir.

Q. Now, in redispatching that traffic, did you balance the tonnage or balance the cars?

[fol. 2895] A. Well, I balanced the cars although I did take into consideration the tonnage, that is, in estimating the tonnage by scanning the consists or the tonnage shown on the consists of the actual trains, the consists that were filed by the train conductors which showed the actual tonnage of the actual trains, and I estimated my tonnage on that traffic.

Mr. Strouss: I asked that because yesterday I was trying to balance the tonnage on exhibit for identification 198, and Mr. Sines saw my difficulty and informed me last night that the balance was of cars and not of tonnage.

Q. That tonnage does show on the train sheets of actual operation?

A. Yes, it shows the actual tonnage.

Q. And on your train sheets for the redispatching the tonnage also shows for the trains redispatched?

A. It does on the district from Tucson to Lordsburg, which was the same as, or the tonnage was figured the same as it was on the district from Yuma to Tucson, which was merely an estimate based on the actual tonnage handled by averaging the cars and tonnage.

Q. Now, taking the operation which is covered by exhibit [fol. 2896] 198, that is one day. If it were desired to see how the tonnage balances as between the actual and the redispatched operation for the period covered by that exhibit, that tonnage can be taken from the sheets of that actual operation, the train sheets?

A. Yes.

Q. And the tonnage for the redispatch from your train sheets for redispatched trains?

A. Yes.

Mr. Strouss: Either you or Mr. Sines could give me that tonnage if I desire it?

Mr. Mason: I think, in answer to your question, Mr. Strouss, I believe that Mr. Sines could give you that information.

Mr. Strouss: Now, in redispatching trains, I think you testified you also took into consideration the traffic to be picked up and to be set out enroute?

A. That is right.

Q. And in the redispatching, if I remember your testimony, the AC-8 locomotive was used as the principal locomotive?

A. Yes, sir.

Q. Were there certain definite specific locomotives assigned to this operation by number?

[fol. 2897] A. No, we indicated the locomotive only by type or class. We designated them as 4100 class which is an AC type locomotive. We didn't assign any particular numbers to the locomotives.

Q. Of course, at the time the actual operation was had, that was in June, 1938, and in August, 1938, the Southern Pacific Company didn't operate any AC-8 locomotives?

A. No, those engines at that time were being built.

Q. They weren't acquired by the company until sometime in 1939?

A. That is correct.

Q. Had never been operated on the Tucson Division at the time you made the redispatch of these trains?

A. No, they had not.

Q. When was the test made of the locomotive by the dynamometer car to determine its tonnage rating?

A. Well, that tonnage rating was furnished us by the vice-president in charge of operations' office.

Q. Well, it wasn't the tonnage rating then determined by the use of dynamometer cars that Mr. Cassady testified this morning?

[fol. 2898] A. Not that particular type, the AC-8, no.

Q. What was the tonnage rating used for the AC-8's on the Tucson division?

A. Eastbound from Yuma to Gila was 11,000 M's, and, if I recall correctly, between Gila and Estrella 7,180 M's, and Estrella to Tucson 11,000 M's, and Tucson to Dragoon——

Q. 6,220?

A. 6,220. That is from Benson to Dragoon. I don't recall offhand the rating between Tucson and Mescal, but it is——

A. 7,800 is what was given to me.

A. Yes, that is correct.

Q. Now, of course, the rating of 6,220, there is no rating given here as between Steins and Lordsburg?

A. Well, that would be 11,000 M's or more, because it is on descending grade.

Q. And westbound between Tucson and Yuma?

A. 12,000 M's, and Lordsburg to Tucson over the ruling grades from Mondel to Steins and Benson to Mescal was 6,220 M's.

Q. Now, since no definite numbers were given to these locomotives, how did you know what locomotives you had on hand when you were redispatching?

[fol. 2899] A. Well, I kept track of these by keeping—I figured that I had an engine for every crew. I did dispatch the train crews, and any time that it was necessary to balance my train crews, or where it would have been necessary to deadhead an engine crew, I always deadheaded that engine back, so at all times I kept even on my power in accordance with the number of train crews that I had to operate with.

Q. If they were all designated as 4100's, how could you designate one engine from the other?

A. Well, I couldn't tell one from another, but I knew that of the number of trains I had operating, the number

of engines that I would receive at Lordsburg westbound, for example, that those engines would operate through to Yuma, and in cases where the train would terminate at Tucson westbound, I would have that number of locomotives left over. I felt at no time with the amount of business being handled and the number of AC locomotives assigned to that district, that we were ever short of locomotives.

Q. Now, when a locomotive made a trip you say you kept track of it by the train crew. In other words, you designated, so far as keeping track of that locomotive was [fol. 2900] concerned, you designated it by its train crew?

A. That is right.

Q. That was all right after the locomotive came into operation, but how did you identify the locomotives that you had available for operation before you assigned a crew to that so that you knew what power you had available?

A. Well, when this operation or this redispatching study was set up, we assumed that we had this number of locomotives on hand to protect traffic at both Tucson and Yuma.

Q. In other words, what you did, you determined the trains you were going to operate, then assumed you had the power there to operate them?

A. That is right.

Q. And whatever was necessary, the locomotives were there for you?

A. That is right, and in cases where it was necessary to deadhead crews from Tucson west to Gila, why, we knew that there was an unbalanced condition and it would be necessary to doublehead power to Gila to protect the eastbound trains.

Q. That is a lot more generous than they are in ordinary practice with power, isn't it?

A. No.

Q. You don't always have all the power that you want? [fol. 2901] A. There are times we would run short, yes, that we would be a little tight on it, but not really tied up.

Q. This operation was on the assumption that the power was always there?

A. That is right.

Q. Now, if I understood your testimony correctly, in making this redispatch, you were to operate in units of a maximum of 100 carloads and 125 cars and empties where the empties were predominant in the train.

A. That was the plan set up, but it exceeded the 100 cars eastward on a few occasions from Yuma with our slow scheduled Yuma blocks in just a few occasions, I forget just the number.

Q. Of ourse, the movement westward is predominantly empties?

A. Yes.

Q. And if you were to follow the principle of 100-car trains loaded with 125-car empties, that would eventually unbalance your power and cars?

A. No, it would tend to make a more balanced condition because your heavy traffic direction is westward, and with your empty cars moving west and if you would handle [fol. 2902] 125 cars westward and 100 cars eastward, it would more balance your power and cars.

Q. Is that true at all times?

A. Yes.

Q. That you would have 25 per cent greater traffic west than you would east?

A. Well, at least that much. During the perishable season we move a great many light engines, or double-head engines eastbound, in order to handle the excess train miles west.

The Court: Pardon me just a minute. Then this surplus, these surplus cars, this 25 per cent excess westward movement, what happens to them, does it eventually go out east again through the Ogden gateway?

A. Well, it can, yes, but it generally is empty refrigerators moving to the Yuma and Imperial valleys and to the P. F. E. shops at Colton, where the supply for the Santa Maria Valley and San Joaquin Valley supply is generally supplied from, and these cars are returned, are generally returned to us through the gateways in which they are received loaded, due to agreement with connecting lines.

[fol. 2903] Mr. Strouss:

Q. You mean that 25 per cent of your westward traffic returns east on some other route?

A. No.

Q. Wouldn't that have to be true, those cars don't remain on the West Coast, do they?

A. I am talking about the perishable season. There are other times of the year when the situation is reversed.

Q. That is what I asked you a little while ago, whether that is true all the time?

A. It is practically. Your train-miles or car-miles are westward the biggest percentage of the time, but there may be a short period where the operation might be reversed, where your train-miles eastward would predominate.

Q. If these cars don't remain on the West Coast, they either have to come back over your line or go over some other road?

A. Yes, they can be worked up and they are worked north to go through Ogden and we also, as late as this last perishable season, moved empty refrigerators over the Ogden route into the Imperial Valley due to our inability to get them through the El Paso gateway.

Q. Is it the usual practice for traffic going westward [fol. 2904] empty, that those cars will not return over your lines?

A. No, they may not all return over the same route, they may go the northern route.

Q. I mean return over the Tucson line?

A. Not necessarily all of it, no.

Q. Twenty-five per cent of it?

A. I wouldn't say as to the exact percentage, but a large amount of it would.

Q. When you made this study in 1939, these AC-8 locomotives had never been operated on the Tucson division?

A. No.

Q. There never had been any long trains operated on the Tucson division?

A. Not that I knew of.

Q. Unless it was before 1912. So far as you know, had any of those AC-8's been operated on any part of the Southern Pacific system in 1939?

A. No, not that particular class, I don't think they had. I think the AC-7 was the largest power we had at that time.

Q. Of course, in redispatching these trains you did determine the speed at which they would operate?

A. Yes.

[fol. 2905] Q. How did you do that?

A. That is something that is based on experience that a train dispatcher has over several years' experience by estimating the speed which a train will make. If you have a locomotive, take an AC-8 for example, rated at eleven thousand M's, if he has in the neighborhood of eight or nine

thousand M's you can figure he will make the maximum speed restrictions on a level grade or descending grade.

Q. That is, if he is carrying his tonnage rating?

A. Yes, over ascending grades an engine with lighter tonnage will make better speed than an engine with a full rating.

Q. What about a locomotive that had never been operated in your district so that you never had experience with actual operation of that locomotive? How did you determine that, just on its tonnage rating?

A. On its tonnage rating, assuming that it would operate the same as any other locomotive and with the percentage of the tonnage to its rating.

Q. Of course the tonnage rating here was not a tonnage rating determined as Mr. Cassady testified this morning [fol. 2906] by operating the engine over the territory with a dynamometer car?

A. No, I think that was determined by the superintendent of motive power as I understand it based on the tractive effort of the locomotive.

Q. It is a fact, isn't it, that a heavier train will take a greater distance to stop than a light train?

A. I won't say that because I have never had any road experience. I don't know.

Q. You don't know whether it takes longer for a heavy train to get under way, get up speed, than a lighter train?

A. It all depends on what power you have. If the engine rating is comparable on a long train to the rating of the locomotive on a short train, I would say he could get under way as quickly as a short train if his tonnage is equal.

Q. Not equal but in proportion to the tonnage rating?

A. Yes.

Q. Assuming that it takes longer to stop or slow down a heavier train than it does a light one, of course then a heavy train approaching a curve or in speed restricted districts will have to begin slowing down quite a distance from those speed restricted districts than a lighter train, wouldn't it? [fol. 2907] A. If that is the case, it would take a longer time.

Q. I am assuming that it does without any question.

A. Well, it would, yes.

Q. It would take a long train longer to pass through a speed restricted district than a short train?

A. Yes.

Q. Was that taken into consideration in the determination of the speed movement of your trains?

A. No, because with the additional twenty-five to thirty cars which we operated on our eastward trains we didn't estimate it would take any longer for those trains to stop or get started or pass through any restricted district. At that time we had no other restrictions except those speed restrictions as shown in our timetable and we made no allowance for them.

Q. What about sidings? It would take longer for the long train to stop and pull into a siding and clear a siding than a short train, wouldn't it?

A. It might take a few minutes more, I would say probably a couple of minutes.

[fol. 2908] Q. It would take longer to get out of the siding?

A. It might, yes.

Q. Was any consideration given to that?

A. I don't recall just whether we gave any consideration to that or not, although I know we did at times allow a little more time at some points in making our meets and passes.

Q. By the way, who selected those sidings or the extending of the sidings?

A. You mean who designated the sidings?

Q. The points where the sidings were to be increased in length?

A. Myself and the trick dispatcher went over the train sheets and working timetables and estimated the points at which the long sidings would be to best advantage for long-train operation.

Q. When did you do that?

A. That was after we first met in Los Angeles, approximately May 15th or some time there. We had two or three days' preliminary discussion before we started the actual redispatching study.

Q. Did you designate those sidings before you made your redispatching study?

A. Oh, yes.

Q. What about the icing? Was consideration given to the icing of perishables?

[fol. 2909] A. Yes, sir.

Q. Where are your icing sheds?

A. At Yuma and Tucson.

Q. What are their capacities?

A. I don't just recall the exact capacity of the tracks. At Tucson I believe on each side we have approximately 70 cars and at Yuma I believe the icing tracks are somewhat longer, I can't recall the exact number.

Q. The memorandum which was given me gives your icing tracks at Yuma, each side, 70 cars. Then there is a notation——

Mr. Mason (Interrupting): Isn't that the platform rather than the track. The figures you have I think are the length of the platform.

Mr. Strouss: It says, "Icing platforms and tracks."

A. Well, of course the tracks are longer than the platforms. You have some space on each end of your icing tracks or platform.

Mr. Strouss: In parentheses is the figure "67" and then "70." I guess I will have to have an interpretation of that. At least it is not over 70 cars at Yuma?

A. No, I believe that is right, on each side of the icing deck.

[fol. 2910] Q. With a train over 70 cars that requires the dividing of that train in order to ice it?

A. Yes, if they all require icing.

Q. The tonnage rating of the other engines which were used are the tonnage ratings given in that timetable?

A. That is given in the Tucson division timetable No. 109 which was given you yesterday, the tonnage ratings are all listed in that timetable.

Q. This redispatching, what it really is or what has been done is, to summarize it, is your opinion of how you would have moved those trains or moved this traffic, rather, assuming there had been no train limit law and assuming the power which you had, using your opinion as to the speed at which the trains would have moved although that power never had been used nor any trains operated in that division before; isn't that true?

A. That is right.

Mr. Strouss: I think that is all the questions I have.

Redirect examination.

By Mr. Mason:

Q. Mr. Baker, I show you the locomotive book and ask you whether or not the tractive power of the AC-8 type

[fol. 2911] locomotive acquired in 1939 is not the same, being 124,300 pounds, as the tractive power of the AC-6's acquired in 1930, the AC-7's acquired in 1937? Will you look at the locomotive book and tell me whether that is not the fact?

A. Yes, that is correct, they have the same tractive power.

Q. Would you expect the tonnage ratings of the AC-8 locomotives to be substantially the same as the AC-6's or AC-7's in view of the identity of tractive power?

A. Yes.

Q. The AC-6's and the AC-7's have been operated on the Southern Pacific in various districts for some time prior to 1938, have they?

A. Yes, they have.

Q. Have you, as dispatcher or chief dispatcher, ever had to undertake the operation of trains over your division with locomotives which up to that time you had never used on that division?

A. Oh, yes.

Q. Frequently?

A. Yes.

Q. Can you give some recent instances?

A. Just after I became chief dispatcher there were several F-4 and F-5 engines that were transferred to the [fol. 2912] Tucson division that hadn't been in use here before and engines with which the dispatchers had no previous experience on this division.

Q. Were you a dispatcher on this division when the 5,000 class was first used on the division?

A. Yes, sir.

Q. Were you a dispatcher here when the F type locomotive replaced the smaller type preceding it?

A. Yes.

Q. Did you have any difficulty then dispatching your trains with these new and up to that time strange type of locomotive?

A. No, none whatever.

Q. Given the tractive effort and other characteristics of the locomotive which is given to you to use, are you able as a dispatcher to work with that locomotive even though you have never used it before?

A. Yes, sir.

Q. I think you indicated in your testimony that generally there was an unbalance of traffic westward and particularly during the perishable season?

A. Yes, sir.

Q. Are there other seasons of the year when the unbalance [fol. 2913] is eastward?

A. There are times when there is a shortage of refrigerators moving westbound in which the preponderance of the traffic would be eastward for a short period of time. That happens generally in the early spring or the late fall periods, that is, on the Tucson division.

Q. From time to time during the year the balance of the traffic may vary so that the preponderance is eastward at one time and westward another?

A. Yes.

The Court:

Q. You don't mean to infer that the preponderance of the traffic or the cars causing that are just put out of commission and not used over on the West Coast?

A. No, I don't.

Mr. Mason:

Q. Does the company, if you know, have any control over whether the balance will be eastward or westward?

A. No, that is controlled entirely by the traffic conditions.

Q. That is the movement of the traffic as billed by the shippers, is it?

A. Yes, for example, we bring many empty boxcars through the Ogden gateway that move into the Northwest. [fol. 2914] A lot of that traffic moves down through the southern gateway after it is loaded and goes the southern route.

Q. That would produce an unequal distribution of traffic, would it, as between the Ogden route and the El Paso route?

A. Yes.

Q. You spoke of working to 100-car trains east and 125-car trains west during the redispatching study. Does that mean all of your westward trains were built up to 125 cars?

A. Oh, no.

Q. You observed that more or less as a standing maximum?

A. Yes.

Q. Does it mean that on your eastward trains you were held to 100 cars as a rigid maximum?

A. No.

Q. Was there necessarily any 25 per cent greater movement westward than eastward?

A. I won't say as to the percentage, although I think during those months if I recall, the westward movement was heavier, that is, the number of cars moved was in greater proportion westward than they were eastward.

Q. Whatever it was, in the actual operation during June [fol. 2915] and August, 1938, it was reproduced on your redispatching study, was it?

A. Yes, sir.

Q. Now as to the number of locomotives, meaning the number of the different engines or the number of engines which were actually used for the purpose of the redispatching study, as I understood your answer to Mr. Strouss you contemplated that an adequate number of locomotives was available at the start of the redispatching period and an adequate number continued to be available throughout the redispatching period?

A. That is correct.

Q. There was no engine shortage at any time?

A. No.

Q. Was there any engine shortage experienced actually during the same periods?

A. No.

The Court: Did you use a greater number of engines in your redispatching study than what was actually used in your operation?

A. No, we used a less number due to the less number of trains it was necessary to operate.

Mr. Strouss: Since there were no definite numbers assigned to the engines, you cannot determine that from your work sheets?

[fol. 2916] Mr. Mason: I will say for the information of the Court and counsel, we will have a showing which will show the exact number of locomotives required and used and I think it will be quite clear how it was worked out.

Mr. Sines will have the showing. There is a way of determining the number from the work sheets, at least I think there is, it has been determined before.

Mr. Strouss: You couldn't by taking an engine number and definitely applying it to any particular engine?

A. No, we didn't assign any particular engine numbers to this redispatching study.

Q. Did you use 4100, or whatever the number was and the engine went out on the division and came back again and another went out or it may have been the same one?

A. Yes.

Q. Are you operating any AC-8's on this division now?

A. No, we are not.

Q. Have you operated any on this division?

A. Yes, we have operated them westward when we were bringing these new locomotives westward, we put those into service at El Paso and worked them west.

[fol. 2917] Q. Just in transportation?

A. Yes.

Q. One thing I overlooked on my cross-examination. The water tank capacity was larger on the AC-8's?

A. Yes, they have a tender of possibly 22,000 gallons capacity.

Q. Those AC-6's and AC-7's that you spoke about are not shown on exhibits Nos. 4 and 5?

Mr. Mason: No, I think for the sake of brevity we showed the AC-4; then the AC-8, which is typical of the AC-6 and 7 as to tractive effort.

Mr. Strouss: Have the AC-6's and AC-7's ever been put in operation on this division?

A. No.

Mr. Strouss: That is all.

Mr. Mason:

Q. Mr. Baker, after the acquisition of the AC-8's in 1939, did you make any further survey of the redispatching study of 1938 in the light of the performance of those locomotives?

A. I didn't understand that question.

The Court: Read the question.

(The question was read by the reporter.)

Mr. Mason.

Q. Did you make any recheck of your redispatching study [fol. 2918] in the light of the performance of the locomotives as operated by the company?

A. No, I was assigned to other duties before we received the AC-8 engines and I never made any other check of the redispatching study.

Q. You have reviewed the redispatching study prior to testifying in this case recently, haven't you?

A. Yes.

Mr. Mason: I think that is all. Did you want to have Mr. Baker remain here tomorrow?

Mr. Strouss: No, I think I can release him with the understanding that if something should arise and I should want to cross examine him further I can call him back again.

The Court: You may be excused, Mr. Baker, subject to call. The court will be at recess until ten o'clock tomorrow morning.

Thereupon the court stood at recess until ten a. m. Friday, January 24, 1941.

[fol. 2919] January 24, 1941, ten o'clock A. M.

Proceedings were resumed at this time as follows:

The Court: You may proceed.

ARTHUR C. BROWNING, was recalled to the stand, and testified further as follows:

Cross-examination.

By Mr. Strouss:

Q. Mr. Browning, I believe you testified that you are, and have been, since January 1, 1941, secretary of the Association of American Railways?

A. Of the mechanical division.

Q. And prior to that time you were assistant secretary since 1919?

A. That is correct.

Q. Now, what is the Association of American Railways?

A. It is an association of the railroads to handle problems that are common to all railroads.

Q. Those problems are investigated by the Association of American Railways?

A. Through its committees, yes.

Q. And directors of research?

[fol. 2920] A. We used to have a director of research, but that position was abolished several years ago.

Q. When the investigations are completed, then reports are made?

A. As far as that applies to the mechanical divison, that is a customary practice.

Q. Then what is the procedure?

A. Well, the procedure, if a new specification is devised and they think it is desirable to put it into effect, it is submitted to a letter-ballot vote of the member railroads.

Q. The reports then are submitted to the member railroads of the Association?

A. That is right.

Q. And a ballot taken, and if it is favored it is adopted?

A. Yes.

Q. Now, are the proceedings of the Association recorded?

A. You mean of the mechanical division?

Q. Of the mechanical division, yes.

A. I don't just understand what your mean by recorded.

Q. As part of the basic records which you handed to me, the basic records from which the exhibits put in evidence [fol. 2921] yesterday, Exhibits 203 and 204, upon which those exhibits were based, are books entitled "Proceedings of American Railways Association, Division V, Mechanical."

A. Yes, sir. It shows the reports of the committee and the action taken on them at the annual meeting.

Q. And these are records upon which you based your testimony and the exhibits which were put in evidence yesterday?

A. Yes, sir.

Mr. Booth: Only as to interchange rules. I didn't refer to those reports for anything and everything that might be in them.

Mr. Strouss: Of course, there are parts of this that I desire to have made a part of the record here. I don't want to make the entire book a part of the record.

Mr. Booth: Well, we called this witness for the sole purpose of proving what the interchange rules of the Associa-

tion were as to interchange of cars between railroads at the present time, and also to prove the development of those rules since 1911 as the rules were promulgated and distributed to the member lines and other persons. Now, the witness under the foundational evidence rule brought with him the annual proceedings of the Association to show that [fol. 2922] those interchange rules were actually adopted by the Association. We made those available to counsel solely for that purpose, not for the purpose of putting in anything and everything or identifying anything and everything that he might choose as part of his own case. I see perfectly well what counsel is leading up to, but I think it will prove to be absolutely improper cross-examination.

Mr. Strouss: Of course, the exhibits that were put in go a little further than Mr. Booth has stated here. The second exhibit was the historical, chronological development of these rules, and as the witness testified, they are adopted, the rules, and then there are amendments by action of the Association in their annual meetings, and their action is recorded; the action leading up to it as well as the adoption of the rules. Now, I think that we have a right to anything relating to the subjects which are included in Exhibit 204, that we have a right to have that part of those reports identified as the record of the proceedings relating to those subjects and when opportunity arises to offer them in evidence, the question of whether they are then admissible in evidence will come up on the offer. These are the basic [fol. 2923] records on which the exhibits were made, as the witness has testified.

The Court: Mr. Strouss, do you propose to go into any matters other than the matters covered by direct examination, that is, those things having to do with the rules and their development?

Mr. Strouss: I intend to offer—I will have to, I don't want to, but if compelled to I will have to ask that each of those volumes be marked as an exhibit for identification in order to afford me opportunity to offer parts of it. I intend to offer the reports of committees and the director of research upon the tests and investigations respecting the air-brakes, the development of air-brakes leading up to the rule adopted in 1933, which is set out in the rule book.

Mr. Booth: Well, we submit that that would be entirely improper cross-examination. We offered the rules and

only the rules. The proceedings were brought in here to make sure that the rules offered were the rules adopted, it is the foundational rule that has been invoked so often in this case, but that counsel can go outside of that we submit would be entirely improper cross-examination, and equally improper to impound records in court that have nothing to [fol. 2924] do with the exhibits we offered.

Mr. Strouss: That is a debatable question, whether they do or do not.

Mr. Booth: Counsel is simply trying to put in in our case something that should be offered independently by him. It is getting in evidence, we might say, insidiously or by left-handed methods of cross-examination.

The Court: What is the question before the Court?

(A reference to the record was made by the reporter.)

The Court: There is nothing before the Court.

[fol. 2925] Mr. Strouss:

Q. In exhibit No. 203, Mr. Browning, I notice on page 16 the rule of interchange covering air brakes. Will you read that rule which appears in exhibit No. 203?

A. (Reading) "Air brakes meeting requirements of A. A. R. Specifications for Air Brakes adopted in 1933, required on all cars built new on or after September 1, 1933, and on all cars rebuilt on or after August 1, 1937. From owners. Air brakes meeting requirements of A. A. R. Specifications for Air Brakes adopted in 1933 or A. A. R. standard triple valves, required on all cars built new between January 1, 1919, and September 1, 1933; and, on all cars rebuilt between July 1, 1928, and August 1, 1937. In interchange. On and after January 1, 1945, all freight cars in interchange service must be equipped with air brakes meeting the requirements of the A. A. R. Specification for Air Brakes adopted in 1933. Each car owner shall make a report semi-annually to the Association of American Railroads showing by months the number of freight cars acquired and the number of freight cars on which brake equipment is converted, which information will be filed semi-annually with the Interstate Commerce Commission.

"Note.—The design of air brake equipment designated [fol. 2926] as "AB" meets all of the requirements of the

A. A. R. Specifications for Air Brakes adopted in 1933. Cars built prior to September 1, 1933, and equipped with "AB" brakes should be so stenciled; for cars built on or after September 1, 1933, and rebuilt on or after August 1, 1937, the date built or rebuilt will govern."

Q. The specifications referred to in this rule do not appear in these rules, do they?

A. No, they are part of the standards of the Association.

Q. Can any air brake appliance be used on a car in interchange without the approval of that appliance by the A. A. R.?

A. No, sir.

Q. When an appliance is used, it must have been tested?

A. It must be adopted as a standard. The rule requires that the A. A. R. standard be used.

Q. This rule which requires meeting the specifications from 1933 of course is a rule adopted after tests and investigation by the Association of American Railroads?

A. That is correct.

Q. Isn't it a fact that in 1924 and 1925, beginning in one of those years, pursuant or under an order of the [fol. 2927] Interstate Commerce Commission the Association of American Railroad began tests of air brakes?

A. It was around that time, I don't remember the exact date.

Q. And those continued through 1932?

A. Yes, sir.

Q. There were first "rack" tests?

Mr. Booth: We object, if the Court please, as improper cross-examination. We introduced the rules and nothing else.

Mr. Strouss: I think we should have a right to find out what this means.

The Court: Overrule the objection to the last question.

Mr. Strouss:

Q. There were rack tests, first, and then road tests?

A. There were laboratory tests followed by road tests.

Q. And different reports of those tests or investigations appear in these records of the annual proceedings, mechanical division, of the Association of American Railroads?

A. Yes, sir.

Q. Who is Harley Johnson?

A. He was director of research of the Association for [fol. 2928] a period of, I should say, seven or eight years.

Q. He made the reports concerning those tests and investigations?

A. He was in charge of all research work including those tests.

Q. When tests and investigations were completed, did he make what was known as an abstract report which was printed and published by the Association of American Railroads?

A. Yes, sir.

Q. Mr. Browning, I hand you plaintiff's exhibit No. 206 and ask you if that is a true and correct copy of the report made by Mr. Johnson and printed and published by the Association of American Railroads?

Mr. Booth: Just a moment, I don't want to put any obstacle in the way of counsel proving any publication of the A. A. R. or any of its committees and for that reason I don't object to this question but I certainly will object to any attempt on cross-examination to offer this report or any portion thereof.

The Court: We cross that bridge when we get to it. Proceed.

A. Yes, sir.

[fol. 2929] Mr. Strouss: Mr. Booth, I would like to have marked for identification certain parts of these records of the annual proceedings. I don't like to have the book itself made a part of the record.

Mr. Booth: I think that is exceedingly unfair here, to impound these records. A witness comes in making merely formal proof that he has with him the proceedings of the Association from which these rules were taken; there isn't any question as to the authenticity of the rules, the rules are published in these books and the series of books is produced. Now counsel for some purpose of his own wants to take these records and impound them in court here for use two or months hence. They are records of the Association and we think that is going entirely beyond the foundational rule.

Mr. Strouss: I don't exactly want them impounded in court, if your Honor please, but I may have to in order to have them available for offering in evidence parts which

I think are pertinent here. There are parts of the records which I want to make part of this record here. I don't mean to necessarily offer them in evidence but to identify them as part of that record. If counsel will agree that the parts I desire may be sustituted and these withdrawn, [fol. 2930] then there will be no reason for impounding these. I talked to Mr. Browning this morning and asked him about retaining the records here for a few days and he told me it would be all right.

Mr. Booth: The thing is I don't want them to go into the custody of the clerk. We can retain them here in our office.

Mr. Strouss: That is all right if you will stipuate that the parts I indicate may be put in as an exhibit for identification.

Mr. Booth: No, we won't stipulate that they may be introduced as an exhibit. We will keep the reports here and when the time comes for you to offer an exhibit you may offer them. I don't know what they are.

Mr. Strouss: If, when the time comes for me to use these records, you will stipulate that they are the records of the meetings?

Mr. Booth: Certainly, because many public libraries have copies of these proceedings.

Mr. Strouss: But those are not here and identified by the witness and these are. If you will stipulate these are the records which Mr. Browning has identified——

Mr. Booth: If you will specify what the reports are, we [fol. 2931] will undertake to have those reports or duplicates of them available for use during the trial.

Mr. Strouss: And will stipulate that they are the annual reports testified to by Mr. Browning in his testimony this morning, the same ones which I am now indicating by years?

Mr. Booth: Those are the reports, aren't they, Mr. Browning?

A. Those are the proceedings, yes.

Mr. Strouss: For the years 1929, 1930, 1931, 1932, and one volume which combines 1938 and 1939.

Q. These specifications adopted in 1933, Mr. Browning, referred to in subdivision 4 of rule 3, are those specifications contained in any other publication?

A. Yes, sir, they are contained in the Manual of Standards and Recommended Practice of the mechanical division.

Mr. Strouss: I think we should have those specifications as a part of the record.

Mr. Booth: I think inasmuch as the rule has been read and the specifications are part of the rule the specifications should be before the Court. We will undertake to furnish them.

Mr. Strouss:

Q. Do you know whether any brake other than the AB [fol. 2932] brake has been approved by the Association of American Railroads as meeting the specifications adopted in 1933?

A. No, sir, not to date.

Q. No other brake to date?

A. No, sir.

Mr. Strouss: That is all the questions I have.

The Court: Mr. Browning, you are associated with the same organization of which Dr. Parmelee is a director?

A. Yes, sir, but a different division.

Redirect examination.

By Mr. Booth:

Q. There is a brake known as the "K-type triple," isn't there?

A. Yes, but that doesn't meet the 1933 specifications.

Q. That K-type triple is permitted on cars in interchange?

A. Yes, it is standard for cars built prior to that date in 1933.

Q. And fully permissible in interchange?

A. Yes, sir.

Mr. Strouss: Until what date?

A. The date set in here is 1945.

[fol. 2933] Mr. Mason:

Q. Your division, Mr. Browning, is the mechanical division of the Association, is it?

A. That is correct.

Q. And Dr. Parmelee's division is the Bureau of Statistics?

A. Yes, sir.

Q. You maintain your headquarters in different cities?

A. That is right.

(Witness excused.)

W. G. Reid was called as a witness in behalf of the defendant and being first duly sworn testified as follows:

Direct examination.

By Mr. Mason:

Q. Will you please state your name and residence to the reporter?

A. W. G. Reid, El Paso, Texas.

Q. Are you in the service of the Southern Pacific Company?

A. Yes, sir.

Q. In what position?

A. Master mechanic, Rio Grande division.

[fol. 2034] Q. With headquarters at El Paso?

A. Yes, sir.

Q. Over what lines does your jurisdiction as master mechanic extend?

A. It extends from Lordsburg, New Mexico, to Tucumcari, New Mexico, and from El Paso via south line to Tucson.

Q. What has been your previous experience in the service of the Southern Pacific Company?

A. I started with the Southern Pacific in 1903, served an apprenticeship as a machinist and later advanced to journeyman, and I was with the Arizona Eastern for a number of years in various capacities, foreman, general foreman, and master mechanic.

Q. Has your experience been entirely in the mechanical department?

A. Practically all my experience has been in the mechanical department.

Q. How long have you been master mechanic at El Paso?

A. Since November, 1924.

Q. What are the duties of the division master mechanic in the position you now occupy?

A. The master mechanic is responsible for the power and equipment on his division and various classes of employees [fol. 2935] under his supervision. He reports to the superintendent of the division and the superintendent of motive power of the district.

Q. Does the master mechanic supervise the repair and reconditioning of rolling equipment used on the division?

A. Yes, sir.

[fol. 2936] Q. Is it part of the duties of the master mechanic to be familiar with the construction, condition and capabilities of the locomotives assigned to his territory?

A. Yes, sir.

Q. Does the master mechanic supervise the reconstruction and repair of cars?

A. In a supervisory capacity, yes.

Q. Do you have on the Rio Grande division an employee known as a car foreman?

A. Yes, sir.

Q. Is he under your jurisdiction?

A. Yes, sir.

Q. Do you have on the Rio Grande division repair tracks and other repair facilities for the inspection and repair of freight cars?

A. Yes, sir.

Q. Do those come under your jurisdiction?

A. Yes, sir.

Q. How are the employees classified and titled who have to do with the inspection and repair of freight cars?

A. We have what is known as car inspectors, car men, we have two classes, Class A and Class B car men.

Q. You have helpers?

[fol. 2937] A. Oh, yes, there are helpers.

Q. And electricians?

A. Electrical department electricians which have to do with cars.

Q. Now, these car men, are they actually repair men?

A. Yes, sir.

Q. Do you have, in addition to these car inspectors and car repairmen, other forces engaged in the repair of locomotives or the inspection of locomotives?

A. Yes, sir.

Q. Are they under your jurisdiction as well?

A. Yes, sir.

Q. For what purpose do you have these inspectors; what do they do?

A. Well, the purpose of the inspector is to inspect the locomotive or car to see that it is in safe and suitable condition, and meets the requirements and laws of the Interstate Commerce Commission.

Q. When you speak of rules, what rules do you have in mind?

A. As to what; as to cars?

Q. As to cars.

A. Well, the rules set forth by the A. A. R. Association, [fol. 2938] which governs the type and classes of cars, the various parts of the cars accepted.

Q. Are you familiar with the code of rules of the Association of American Railroads, which has been offered here for identification as defendant's exhibit No. 203?

A. Yes, sir.

Q. Do you have on the Rio Grande Division points at which freight cars are interchanged with other carriers?

A. Yes, sir.

Q. Will you name those points?

A. At Tucumcari, New Mexico, the Rock Island; El Paso, Texas, T. P., Texas Pacific, and Santa Fe, A. T. & S. F.

Q. And Texas and New Orleans Railroad?

A. The Texas and New Orleans.

Q. Do you interchange at Deming?

A. Yes, sir, we set out cars at Deming for the Santa Fe at that point, we don't have an inspector for interchange purposes there other than the agent.

Q. Now do you make inspection of cars which are received by you from connecting carriers at El Paso and Tucumcari?

A. Yes, sir.

[fol. 2939] Q. For what purpose do you make these particular inspection of cars received on interchange?

A. To see that the cars offered on interchange company with the rules contained in the manual.

Q. You mean Exhibit 203 for identification?

A. Yes, sir, and also meet the requirements of the Interstate Commerce Commission on safety appliance standards.

Q. Suppose that a car inspected at the interchange point fails to meet the requirements of Rule 2 or 3 in that it contains or has attached to it appliances or devices which do

not comply with the standards prescribed by rules 2 and 3 of Exhibit 203 for identification, what do you do with that car?

A. If that car doesn't meet the requirements of the rules, we reject them.

Q. What happens to the lading of such a car in case it doesn't meet such requirements?

A. It would have to be transferred to a car that would be accepted.

Q. Is every car that is tendered to you for interchange at Tucumcari or El Paso, inspected before movement over Southern Pacific lines?

A. Yes.

Q. Has that practice prevailed throughout your oc-
[fol. 2940] cupancy of the position as master mechanic?

A. Yes, sir.

Q. From your experience, will you state approximately how frequently and under what circumstance you have, during the past year, for example, rejected a car tendered to you on interchange?

A. When not complying with the rules?

Q. For not complying with the Association rules?

A. I don't recall of rejecting any car in the past year.

Q. Now, does that mean that cars tendered to you have been inspected and found to comply with these rules?

A. Yes.

Q. Will you say whether or not, in making these inspections, you have in the past and you do now comply strictly with the interchange rules as set forth in Exhibit 203 for identification and the preceding issues?

A. Yes, sir.

Q. I take it, that the code of rules as it exists at present, or has existed in the past, is virtually your bible on interchange inspections.

A. That is correct; we are governed by it solely.

[fol. 2941] Q. Do you maintain car forces for the purpose of making inspection of freight cars at various points on the division?

A. At our main terminals we have inspection forces.

Q. Now, irrespective of the inspections on interchange, do these forces inspect cars in freight trains before such trains leave those terminals?

A. Yes, sir.

Q. Do you maintain such forces at Douglas?

A. Yes, sir.

Q. At Lordsburg?

A. No, sir.

Q. Did you in the past maintain them at Lordsburg?

A. We did. I think the force at Lordsburg was discontinued in 1929 or '30.

Q. Did you heretofore maintain such forces at Carrizozo?

A. Yes, sir.

Q. Are they now maintained?

A. No, sir.

Q. When were they discontinued, if you recall?

A. Well, I can't recall definitely. They were discontinued [fol. 2942] prior to my time, along about 1923, that is not definite.

Q. Do you make inspections of freight cars and freight trains as they arrive at the principal terminals?

A. Yes, sir.

Q. As well as prior to departure?

A. That is right.

Q. Are the inspections by car forces at the present time as frequent either in point of time or as to miles traveled as in prior years?

A. How far back?

Q. Well, to 1924?

A. No.

Q. What fact, if any, has permitted you to reduce the frequency of inspection by car forces?

A. The improvement in the type of equipment handled.

Q. Mr. Reid, I think you stated that one of the necessary duties or qualifications of the master mechanic is to be familiar with the characteristics and capabilities of locomotives assigned to the division?

A. Yes, sir.

Q. And does that include knowledge of their pulling power?

A. Yes, sir.

[fol. 2943] Q. And the work which they will perform under various conditions?

A. Yes, sir.

Q. Is pulling power substantially the equivalent or the same as tractive effort?

A. That is right.

Q. And the work which will be performed under different conditions corresponds to the tonnage rating, does it not?

A. Yes, sir.

Q. Will you state whether or not the use of the dynamometer car is necessary to determine the tonnage ratings of locomotives if their tractive effort is known?

A. No, sir.

Q. Have you found it necessary to use the dynamometer car on the Rio Grande division in order to determine tonnage rating of locomotives?

A. Not to determine tonnage rating alone; we have used the dynamometer car last year on AC-9 locomotives to determine the tonnage that they can haul; the efficiency of fuel, water evaporation, and many other things that go along with the dynamometer car test.

Q. Were you on the division when the 5000 Class locomotives were first placed in service?

[fol. 2944] A. Yes, sir.

Q. Was it necessary to use a dynamometer car to determine their ratings?

A. No, sir.

Q. Are you familiar with the locomotives of the classes designated as AC-6, and 7, and 8?

A. I am familiar with them by knowledge, but not from practical operation.

Q. You are familiar with locomotives of the Southern Pacific generally, are you, Mr. Reid?

A. Yes, sir.

Q. Now, taking the AC-6, 7 and 8 designations as typical, does the designation of one series as AC-6 and another as AC-7, necessarily signify any substantial difference between the locomotives classed as 6's and those classed as 7's?

A. Not in the type of locomotive, no.

Q. Does the designation of still a more recent series of locomotives, as the AC-8, mean that they differ essentially from the AC-6 and 7?

A. Not to a great extent, no.

Q. Do the Southern Pacific 5000 class locomotive, is there any substantial difference between the SP-2 and SP-3 class?

A. No, sir.

Q. What is the significance of this series number, so to [fol. 2945] speak?

A. Well, when the locomotive is first purchased, say in 1910, they designate it as AC-7.

Q. I think the AC-7 was brought out in 1937.

A. That was for illustration. Later on, they may purchase the same type locomotives with some minor improvements on that locomotive which will change the seven to an eight, for illustration.

Q. There will be preserved perhaps the same wheel arrangment?

A. Yes, sir.

Q. The same tonnage rating?

A. Yes, sir.

Q. The same boiler pressure?

A. Yes, sir.

Q. You are familiar, of course, with the S. P. type locomotives, are you?

A. Yes, sir.

Q. They are in continuous use on the Rio Grande division, are they not?

A. Yes, sir.

Q. Now, with reference to the S. P. 2 type of locomotive which is referred to on Exhibit No. 5 do you recall, by the way, when the SP-2 was first placed in service on the Rio Grande division?

A. No, I can't recall, I think it was along in 1930, somewhere along in there, 1932.

[fol. 2946] Q. Do you recall the numeral series of the SP-2 type assigned the 5000 numbers?

A. Yes, 5000 on to 5039.

Q. That includes all the SP types?

A. Yes, sir.

Q. Mr. Russell's exhibit No. 7 shows that in 1926 locomotives numbered 5016 to 5038 were purchased. Would that be the SP-2 type?

A. That might be the SP-3,—let's see, probably the SP-2 followed by the SP-3.

Q. I show you the Southern Pacific locomotive book. Will you state by reference to the locomotive book when the SP-2 type was purchased?

A. 1926.

Q. Now, having the SP-2 type of locomotive in service, followed by the purchase, a year or more later, of the SP-3 type, which, according to exhibit No. 7 has the same tractive effort and substantially the same weight on drivers, would it be possible when the SP-3 type arrived on the division, to determine in advance the performance which you could reasonably expect of it, basing that determination upon the performance already had of the SP-2 type?

A. Yes, sir.

[fol. 2947] Q. And the fact that there was a difference in the numeral series, as between the two and three designation, wouldn't handicap you in that determination, would it?

A. Not at all. It would be governed by the tractive power of the locomotive just the same.

Q. The locomotive being similar as to wheel arrangement?

A. Yes, sir.

Q. And other essential characteristics?

A. That is correct.

Q. Then having the AC-8 class with the same tractive effort as the AC-6 and 7, would the same results follow?

A. Yes, sir.

Q. Mr. Reid, I think you mentioned in your statement of the character of the inspection given, that your employees at the interchange points inspect for compliance of I. C. C. standards?

A. Yes, sir.

Q. Just what standard do you have in mind there?

A. That is all safety appliance standards, such as handholds, steel steps, high and low couplers, defective wheels, brake hangers, brake beams, anything that is specified by the law.

[fol. 2948] Q. Suppose that an inspector discovers a safety appliance defect, is that the term you use, by the way?

A. Yes.

Q. Suppose an inspector discovered such defect on a car as it is inspected at the receiving point, what action is taken?

A. That defect must be corrected before the car is permitted to go forward.

Q. Does that mean an immediate repair?

A. Yes, sir.

Q. Or, if repair cannot be accomplished, what is done with the lading in the car?

A. If the repair could not be made in the train yard, the car would be sent to the repair track.

Q. Does that sometimes mean a transfer of the lading?

A. Well, those cases are rather remote.

Q. You mean the transfer of the lading is comparatively rare?

A. Yes.

Q. Safety appliance defects are capable of repair usually in the train yard or light repair track?

A. Yes, that is right.

[fol. 2949] Q. Suppose that inspection reveals some damage to the car not affecting either A. A. R. standards or safety appliances, what is done with the car?

A. Well, if the repair is not made, a defect card is issued stating the defects existing on the car at the time of inspection. It is either forwarded to destination or if the car was homeward bound it would go to the owner where he would make repairs at the first available point and bill the line responsible for such repairs under the rules of the A. A. R. Association, mechanical section.

Q. Now, that repair card you speak of being issued in the case of this particular class of defect is actually tacked on the car as it goes forward, is it?

A. That is correct.

Q. Can you give an example of a class of defect which would not involve either a safety appliance defect or a defect calling for rejection on interchange?

A. Well, we can take on our P. F. E. cars, the wood upper structure, the wood sheating and a raked siding as we call it, there may be four or five boards in the siding raked to a depth where they are condemnable and hence need to be renewed but would not damage the contents of the car [fol. 2950] while enroute.

Q. And wouldn't involve any safety appliance defect?

A. No, sir.

Mr. Mason: You may cross-examine.

Cross-examination.

By Mr. Strouss:

Q. With respect to your testimony concerning boiler pressure, of course, difference in boiler pressure will affect

the power of an engine?

A. That is right.

Q. The greater the boiler pressure, the more power the engine has?

A. Yes.

Q. When you said that tonnage rating is governed by tractive effort only, do you mean that exactly?

A. Well, that is the formula used in determining the tonnage rating of a locomotive, it is taken, starts from the tractive effort of the locomotive.

Q. Tonnage rating is the tonnage that the locomotive will pull, isn't it?

[fol. 2951] A. Yes, at a given speed. The speed is determined, as to the maximum, say at twelve miles an hour, or fifteen.

Q. In other words, that is the drawbar pull?

A. Yes.

Q. And the tractive effort wouldn't take into consideration the weight of the locomotive itself?

A. Oh, yes, sure; yes, weight, cylinder size, boiler pressure, weight on drivers is effort.

Q. In the tractive effort, do you consider the weight of the engine?

A. The weight would have to be primarily used to determine the tractive effort.

Q. Isn't the difference between the drawbar pull, that is, the pull of the engine after taking away the effort necessary to move the engine itself?

A. Well, the drawbar pull excludes the locomotive, I understand it.

Q. Isn't that the difference between the tractive effort and the drawbar pull?

A. Well, I can't answer that question whether it is figured exactly that way or not.

Mr. Strouss: That is all.

[fol. 2952] Redirect examination.

By Mr. Mason:

Q. When you speak of the weight of the engine entering into the tractive power, you have in mind the weight of the engine causing adhesion to the rail?

A. That is right.

Q. That is calculated in before the final units of tractive effort is arrived at, is it not?

A. I understand that.

Q. And the tractive effort bears a direct relation to the tonnage rating, which is the amount of the tonnage which the engine will move at a particular speed and over a particular district?

A. That is right, you would have the power of the locomotive to determine the tonnage it will haul over a given grade at a given speed.

Q. Tractive power is the same for a locomotive wherever it may be?

A. Yes.

Q. But tonnage rating is what it will do under certain conditions?

A. Yes, at a particular speed.

Mr. Mason: That is all.

Mr. Strouss: That is all.

(Witness excused.)

[fol. 2953] The Court: We will take our recess at this time.

(Thereupon, a short recess was taken, after which proceedings were resumed as follows:)

[fol. 2954] A. F. Burke was called as a witness in behalf of the defendant and being first duly sworn testified as follows:

Direct examination.

By Mr. Mason:

Q. Will you please state your name and residence to the reporter?

A. A. F. Burke, Tucson.

Q. What is your position with the Southern Pacific Company?

A. Master mechanic, Tucson division.

Q. How long have you been master mechanic of the Tucson division?

A. Since January, 1925.

Q. Or for sixteen years?

A. Yes, sir.

Q. Did you have experience prior to that time in the mechanical department of the Southern Pacific Company?

A. Yes, sir.

Q. With the car or engine repair forces?

A. In the locomotive department.

Q. You heard Mr. Reid's description of the duties and responsibilities of the master mechanic of the Rio Grande division, did you?

[fol. 2955] A. Yes, sir.

Q. Are your duties and responsibilities as master mechanic of the Tucson division similar?

A. Yes, sir.

Q. Does your jurisdiction extend over the entire lines of the Tucson division?

A. Yes, sir, from Yuma to Lordsburg through Phoenix and through Gila.

Q. What points on the Tucson division are there at which you interchange freight cars with other carriers?

A. Phoenix, Arizona, and Nogales.

Q. Do you maintain inspection forces at those points?

A. Yes, sir.

Q. Do you make inspections for the determination whether cars offered in interchange comply with A. A. R. requirements?

A. Yes, sir.

Q. What standards would such cars meet? Is it set down in any publication?

A. According to the Code of Rules of the A. A. R. and safety appliance.

Q. Is that the Code of Rules which has previously been identified here as exhibit No. 203 for identification?

[fol. 2956] A. Yes, sir.

Q. You also inspect for compliance with the safety appliance rules of the Interstate Commerce Commission?

A. Yes, sir.

Q. In the same manner as has been described?

A. Yes, sir.

Q. In your experience how frequently do you find it necessary to reject a car offered in interchange because of failure to comply with the A. A. R. Code of Rules?

A. In checking up I can't find that we had any in Phoenix that the A. A. R. don't comply with.

Q. You never have had any at Phoenix in your experience?

A. No.

Q. What about Nogales?

A. We have occasionally where they come out of Mexico that they will put a defect card on and route it to us and we make the repair.

Q. Where a defect card is put on, does that mean that the car can be moved and repaired at the first repair point?

A. Yes, sir, providing it is safe.

Q. Where you find a car defective as not complying with Interstate Commerce Commission safety appliance require-

[fol. 2957] ments, what do you do with it?

A. We always repair them.

Q. At once?

A. At once, if it is at a terminal where we have car men; if not, then the crews are notified to that effect. At the first place they arrive they are repaired.

Q. Do you maintain car inspection forces on the Tucson division at points other than Nogales and Phoenix?

A. Yes, we have them at Yuma and Tucson.

Q. What inspections do your car forces make at Yuma and Tucson?

A. On all trains arriving and departing.

Q. For what defects do they inspect?

A. For the wheels, running gear, draft gear, safety appliances, see that they conform to the A. A. R. rules.

Q. If you find a car not conforming to the A. A. R. rules, what do you do with it?

A. We tag it and repair it before it moves.

Q. Suppose you found some car, for example, at Tucson on your inspection which has arch-bar trucks instead of side frames, what do you do with that car?

A. That car cannot be moved off the division.

[fol. 2958] The Court:

Q. These inspections that you and your forces make are rather thorough inspections, not just casual inspections?

A. No, our car inspectors are all familiar with the Code of Rules and also have their gauges and make a thorough inspection of wheels and equipment.

Q. Does that require them to get down under these cars?

A. They do, to look at the brake rigging as they go by; yes, sir.

Mr. Mason:

Q. You say that a car with arch-bar trucks cannot be moved off a division. Is that because arch-bar trucks have been outlawed?

A. Yes, sir.

Q. By the A. A. R. code?

A. By the A. A. R. code, yes, sir.

Q. Are you familiar with the locomotives generally in service on the Southern Pacific lines and particularly those on the Tucson division, Mr. Burke?

A. Yes, sir.

Q. Are you familiar generally with the tractive effort and tonnage ratings of the various types previously or presently in use on this division?

A. Yes, sir.

[fol. 2959] Q. Do you know and, if so, will you state whether in your sixteen years as master mechanic here the dynamometer car has actually been used for the purpose of obtaining tonnage ratings of locomotives on the Tucson division?

A. No; the car has never been here for that purpose during my time.

Q. Were the F-4 types of locomotives brought to the division for use here since you have been master mechanic?

A. Off and on. They were here prior to my time and then they were away and came back.

Q. They are now in use here?

A. Yes.

Q. Was it possible to determine their tonnage rating by reference to their tractive effort?

A. Yes, sir.

Q. Did you follow the same process when the S. P. type locomotives were placed in service here?

A. Yes, sir.

Q. Will you say whether or not the locomotives in use on the Tucson division at the present time are equipped with power reverse gears?

A. Yes, sir. Not all the locomotives are, those that weigh 150,000 pounds on the drivers or over are equipped with power reverse gears.

[fol. 2960] Q. Would that include the Mikado type?

A. Yes, sir.

Q. And the F type?

A. Yes, sir.

Q. And all later types?

A. Yes, sir.

Q. Are they equipped or any of them equipped with the so-called "8-ET" brake equipment?

A. Yes, sir, that is the latest locomotive brake, the T equipment.

Q. Is that equipment on all these locomotives in main line service?

A. Yes, sir.

Q. Are these locomotives or any of them equipped with back pressure indicators?

A. Yes, sir.

Q. Is that universal?

A. No, that is on the later type and they are putting it on some of them as they go through the shop.

Q. Commencing with what series or type?

A. We have some F 4 with the back pressure gauge on. I don't think there are any of them smaller than that.

Q. Are they on the S.P. type?

A. Yes, on some of them.

[fol. 2961] Q. Is it on the Mountain type?

A. No, sir, I don't think so. They run right through here, I think some of them are equipped; in other words, they intend to equip all of them as they go through.

Q. Are you familiar by observation with the coal-burning locomotives used by the Southern Pacific?

A. Yes, sir.

Q. Are these equipped with mechanical stokers?

A. Yes, sir.

Q. Are the S.P. locomotives on the Tucson division equipped with feed water heaters?

A. The majority of them.

Q. Super-heaters?

A. Yes, sir, all super-heated.

Q. Are they equipped or any of them equipped with speed indicators?

A. None of them are on the Tucson division, no, sir.

Q. There is an appliance known as the "valve pilot," is there not?

A. Yes, sir.

Q. Are you familiar with it?

A. Yes, sir.

Q. Is that coming into use on the later types?

[fol. 2962] A. All power now being received has that equipment.

Q. You have seen it applied on the newer types as they pass through Tucson?

A. Yes, sir, and I also visited El Paso and looked over one of them.

Q. What is the function of the valve pilot?

A. Showing the back pressure that is working against the pistons in operating the locomotive and also the speed recorded.

Q. It is a speed recorder, is it?

A. Yes, sir.

Q. You spoke of an inspection by car forces at Tucson. Is that inspection given to all cars whether refrigerator cars or of other ownership?

A. All cars are given the same inspection, thorough inspection.

Q. Mr. Cartmill of the Pacific Fruit Express Company in his testimony testified as to inspections made by car forces employed by the Pacific Fruit Express Company. I will ask you whether the inspection made by your car forces is combined with or in addition to that made by the Pacific Fruit Express Company forces?

A. No, they are separate inspections.

Q. Are the points at which car force inspections are [fol. 2963] made today the same as in 1925 when you became master mechanic?

A. Yes, sir, the same.

Q. You haven't made any reduction in the inspections?

A. No, sir, not on the division.

Mr. Mason: I think that is all, thank you.

Mr. Strouss: No cross-examination.

(Witness excused.)

F. P. McDONALD was called as a witness in behalf of the defendant and being first duly sworn testified as follows:

Direct examination.

By Mr. Mason:

Q. Will you please state your name and residence to the reporter?

A. F. P. McDonald; residence, Glendale, California.

Q. Your official headquarters?

A. Los Angeles.

Q. What position do you occupy?

A. Master mechanic, Los Angeles, division.

Q. How long have you been master mechanic?

A. Since July 1, 1923.

[fol. 2964] Q. Did you have prior experience in the mechanical department of the company?

A. Yes, I started as machinist apprentice and worked as a machinist prior to coming to the Southern Pacific in 1903.

Q. You have been with the Southern Pacific Company since 1903?

A. Since September 27, 1903, as roundhouse foreman, general foreman, assistant master mechanic, and master mechanic.

Q. For eighteen years approximately you have been master mechanic at Los Angeles?

A. Eighteen years approximately.

Q. You heard the testimony of Mr. Reid and Mr. Burke as to the duties and responsibilities of the division master mechanic, did you?

A. Yes.

Q. Are your duties and responsibilities the same as testified to by them?

A. Yes, sir, the same responsibilities.

Q. As master mechanic, do you become familiar with the use and capabilities of locomotives in service on your division?

A. Yes, sir.

Q. Have you had or do you now have in service on the Los Angeles division locomotives of the AC type, particu- [fol. 2965] larly identified as the AC-6, AC-7, and AC-8?

A. We have had AC-6 and AC-7's operating on the Los Angeles division. We now have the AC-8.

Q. From your experience with these AC locomotives, will you say whether there is any substantial difference in performance as between the AC-6, AC-7, and the AC-8?

A. There is no difference in the performance. There is some difference in the gadgets or appliances on the locomotives which has developed a more modern method of operation.

Q. Mr. Burke testified that locomotives being recently received are equipped with the valve pilot. Is that one of the characteristics of the AC-8?

A. That is one of them.

Q. Is that a difference as between the AC-8 and the AC-6?

A. Yes.

Q. Are the other differences between the two locomotives of the same character, generally speaking?

A. They have gauges that indicate the heating of the fuel oil and gauges that will indicate the water level or gallons of water in the tender.

[fol. 2966] Q. As to boiler pressure and hauling capacity, the two are the same, are they?

A. The same tractive effort.

The Court: What do you mean by "valve pilot"?

A. That indicates the speed of the locomotive, also it indicates the back pressure, exhaust pressure or resistance of the pistons to the cylinder head and also the pressure at the steam chest where the steam gets egress to the cylinder.

Q. All that is registered at a point where the engineer can readily see it?

A. Yes, sir.

Mr. Mason:

Q. I take it that the valve pilot is something like a speedometer or other gauge on the dashboard of a motor car, as an assistance to the operator?

A. Yes, even better.

Q. It does not affect the hauling capacity or other characteristics of the locomotive?

A. No, it makes it easier for the locomotive engineer to do a better job in operating the locomotive.

Q. You heard Mr. Burke's testimony as to the appliances, such as feed water heaters, back pressure indicators, power reverse gears, and so forth. Are those likewise applied to locomotives in general use on the Los Angeles division?

[fol. 2967] A. The new or heavier locomotives come to us with the air reverse and the back pressure indicators. The older types of locomotives are now having the air reverse applied, or what they call the "power reverse."

Q. Does that relieve the locomotive engineer of some of his manual labor?

A. It has increased the efficiency of the locomotive.

Q. You heard Mr. Burke's testimony as to the 8-ET brake equipment. Is that also in use on your locomotives?

A. Practically all of the later type locomotives and with the possible exception of a few of the Consolidation type.

Q. Is the 8-ET brake equipment applied to substantially all of your locomotives in main line freight service?

A. Yes, sir.

Q. And in main line passenger service?

A. Yes.

Q. Do you have any points on the Los Angeles division at which freight cars are interchanged as between Southern Pacific and connecting carriers?

A. Los Angeles and Colton.

[fol. 2968] Q. Those are your principal interchange points, are they?

A. Yes.

Q. Do you maintain inspection forces at those and other points for the purpose of inspecting cars?

A. Only at Los Angeles.

Q. Where cars are received at Colton, what is done with those cars?

A. We accept the inspection of the delivery line.

Q. Of what employees do those inspection forces consist at Los Angeles, what character of employees?

A. Car inspectors.

Q. Car forces as distinct from train service employees?

A. Yes, car forces.

Q. Are they under your immediate jurisdiction?

A. Yes, with the exception I have a master car repairer under my supervision.

Q. Are these inspectors also accompanied by car repair men?

A. Do I understand your question—do we have car repair men?

Q. Yes.

A. Yes, we have car repair men.

[fol. 2969] Q. The inspectors themselves sometimes make minor repairs, do they not?

A. Yes.

Q. For what purpose do you make these inspections on interchange at Los Angeles?

A. To have assurance that the cars meet all the requirements of the A. A. R. rules and safety appliances.

Q. And incidentally for any defects which do not involve A. A. R. rules or safety appliances?

A. Any other cause which would be a contributing cause to accidents.

Q. If a car does not conform to the standards set up in the A. A. R. Code of Rules governing the interchange of cars, what do you do with it?

A. If the defect was such as a weak siding or damaged siding, we would place a defect card on it.

Q. Suppose that a car arrives with arch-bar trucks, what do you do with it?

A. It would be immediately removed from service.

Q. You reject that on interchange?

A. Right there.

Q. In your experience do you find it necessary to reject cars on interchange from time to time?

A. No, in the year 1940 we haven't a record of one car [fol. 2970] rejected.

Q. Does that mean that they have been found after inspection to comply with A. A. R. standards?

A. Yes, sir.

[fol. 2971] Q. What are the railroads with which you interchange at Los Angeles?

A. The Union Pacific and the Santa Fe interchange.

Q. Do you interchange with the same railroads at Colton?

A. The Pacific Electric and the Union Pacific and the Santa Fe at Colton.

Q. When your inspection reveals safety appliance defects, what do you do with the cars?

A. Well, we cut out and set over for repairs.

Q. Before being moved?

A. Before being moved out of the yard, or if it is an important load and had to require unloading to make such repairs, why, the car would be sent in to the unloading track with instructions to all concerned as to what the defect was.

Q. Then the car would not be moved away from Los Angeles without being repaired?

A. No.

Q. Do you maintain inspection forces other than at Los Angeles and Colton for the purpose of inspection of cars in trains?

A. No.

Q. You don't maintain any force at Santa Barbara?

[fol. 2972] Or Indio?

A. No, we have, I might say, repairmen at that point.

Q. Do they make inspection of trains on arrival or prior to departure?

A. No.

Q. What is the purpose of maintaining car repairmen at those points?

A. Any defect or any damage through accident otherwise, such as water cars or maintenance of way cars on that district that require attention, or cars such as experience a cut journal, it would be necessary to change a wheel out any time, they would be changed out and these forces would be used for such attention.

Q. Are they in the nature of forces for emergency or running repairs?

A. Yes, emergency repair forces.

Q. Have you used the dynamometer car on the Los Angeles division for the purpose of obtaining tonnage rating, Mr. McDonald?

A. Yes, they have used it there.

Q. Recently?

A. No, not recently. They used it for obtaining efficiency ratings on GS engines, the difference between an engine lubricated with oil and lubricated with grease; the [fol. 2973] driving parts of it.

Q. But only for the purpose of obtaining the results of different types of lubrication?

A. Yes.

Q. And not for the purpose of obtaining different engine ratings. By the G. S. locomotive you mean a 4400?

A. Yes.

Q. That is a passenger type?

A. Yes, sir.

Q. What is the wheel arrangement?

A. 4-8-4.

Q. I take it that the dynamometer car may be used for other purposes in connection with locomotives than merely to obtain tonnage ratings?

A. Yes, sir.

Q. What are some of these other results that can be obtained?

A. Well, efficiency and fuel consumption.

Q. Water consumption?

A. Yes, water, of course, that fits in with fuel.

Q. The results of lubrication?

A. And lubrication, yes, on friction, journal friction.

Q. Is the use of a dynamometer car necessary in order [fol. 2974] to determine tonnage rating, or can you arrive at tonnage rating without it?

A. A locomotive is designed for certain tractive effort, and if there is any question or any difficulty experienced in a locomotive handling that allowed tonnage, why, the dynamometer car is called into use for a test to ascertain why the locomotive will not handle the allotted tonnage.

Q. Then it is used more as a check than for the purpose of determining the rating in the first instance, is that correct?

A. That is right.

Mr. Mason: That is all. You may cross-examine.

Mr. Strouss: No questions.

(Witness excused.)

Mr. Mason: We will now call Mr. Judson.

Mr. Booth: If the Court please, Mr. Judson is the last of our witnesses on what I term the first branch of our case. He would have been on the stand before, but he was called away from Tucson when he was here formerly.

[fol. 2975] W. W. Judson was called as a witness on behalf of the defendant and, being first duly sworn, testified as follows:

Direct examination.

Mr. Mason:

Q. Will you please state your name and residence, Mr. Judson?

A. W. W. Judson, St. Paul, Minnesota.

Q. Are you employed by the Northern Pacific Railway Company?

A. Yes, sir.

Q. In what capacity?

A. General manager of lines east.

Q. What has been your experience with the Northern Pacific, and in railroad service generally, Mr. Judson?

A. I have been with the Northern Pacific for 26 years in various positions, in the engineering department to start with, special assistant to the vice-president, train master, assistant general manager, superintendent, and general manager.

Q. As general manager of lines east, how far does your jurisdiction extend?

A. As far west as Livingston, Montana.

Q. Does that include all of the lines west of St. Paul [fol. 2976] and Ashland, Wisconsin?

A. Yes, sir.

Q. In your prior positions in the operating department, has your jurisdiction, or the scope of your duties extended to all parts of the System?

A. Yes.

Q. Will you say whether or not you are familiar as an operating officer with the entire system of the Northern Pacific?

A. I am.

Q. I take it, you have travelled over it many times?

A. Yes, sir.

Q. As general manager, do you now travel over the lines frequently?

A. Yes, sir, the lines east.

Q. There has been heretofore offered for identification a map in one sheet marked as Defendant's Exhibit No. 50,

witness Gregory, which is, according to its title, a map of the Northern Pacific Railroad Company. Have you previously seen a copy of that map, Mr. Judson?

A. Yes, sir.

Q. Will you say whether or not it is a reasonably accurate outline of the Northern Pacific Railway Company lines [fol. 2977] and the territory which it serves?

A. I believe so.

Q. And indicates the principal points with reasonable fidelity as to location?

A. Yes, sir.

Mr. Mason: We offer the exhibit as Defendant's No. 50.

Mr. Strouss: The same objection as made to the previous exhibits from foreign roads.

The Court: The objection is overruled. It may be admitted.

(The document referred to was received in evidence and marked, "Defendant's Exhibit No. 50.")

Mr. Mason: Mr. Judson, in your trips over the line, do you ride entirely in passenger trains?

A. No, sir.

Q. Do you ever ride in freight trains?

A. Yes, sir, passenger trains, freight trains and special trains.

Q. When you ride in a freight train, do you use a business car?

A. Usually.

Q. Where do you have it placed on the train?

A. Usually on the rear end, but I have ridden behind the locomotive.

Q. Do you make any selection of the type or size of freight [fol. 2978] train to which the car is to be attached?

A. No, not as to size, the nature of the train usually.

Q. You prefer a through train to a local?

A. Oh, no, but there is usually some reason for riding the freight train. Often, it is the more important train.

Q. Do you make any distinction as to length of the train, whether it be over 70 cars, in attaching your business car?

A. No, sir.

Q. Will you say whether or not you have made trips in your business car attached to the rear end of freight trains of substantially more than 70 cars?

A. Yes, sir, I have.
Q. How frequently?
A. Oh, maybe once or twice a year.

Mr. Strouss: The record may show that my objections are going to this.

The Court: Yes, the record may show the running objection that the State heretofore made to the testimony of these witnesses from other roads.

Mr. Mason: Mr. Judson, does the Northern Pacific Rail-[fol. 2979] way Company's operating department have a book of rules for the guidance of transportation department employees?
A. They do.
Q. Is that a printed code?
A. It is.
Q. Issued to employees for their guidance?
A. Yes, sir.
Q. Are you familiar with the standard code of rules of the Association of American Railroads?
A. In a general way.
Q. Will you say whether or not the Northern Pacific Rule Book corresponds to the Association Code?
A. It follows it very closely, not exactly the same. There are certain rules that are some different.
Q. Is the main line of the Northern Pacific equipped with block signals?
A. Yes, sir.
Q. Throughout?
A. Yes, sir.
Q. Will you describe them as to type?
A. We have the older type which on the Northern Pacific is the upper quadrant three position arm, the newer type [fol. 2980] are the three color light signals, the later installations.
Q. You use either one or the other over the entire main line, do you?
A. Yes, sir.
Q. Do you have any installation of cab signals on the line?
A. No, sir.
Q. Any centralized traffic control?
A. No, sir.
Q. Is your line predominantly double track or single track?

A. Predominantly single track.

Q. You have stretches of double track?

A. Yes, sir.

Q. Where are the stretches of double track found?

A. Well, they are in various locations. There is double track out of St. Paul to Staples, and from Staples to Fargo. Fargo is not shown on this map.

Q. Fargo is at the point where your line enters North Dakota, is it not?

A. Yes, sir, right on the line. Then double track on the mountain from Livingston to Logan with the exception of the Bozeman Tunnel. There is double track from Garrison [fol. 2981] to Missoula. There is double track from Seattle to Portland, and a few other small locations, I mean a few other small mileages at other locations.

Q. I take it that the double track is largely in the neighborhood of important division terminals?

A. That is right.

Q. This line from Seattle to Portland, is that the line used jointly with the Union Pacific and the Great Northern?

A. It is.

Q. Mr. Judson, I will ask you to refer, if you will please, to Defendant's Exhibit 2. Have you heretofore been furnished with a copy of that exhibit?

A. I have.

Q. First I will ask you if you are generally familiar with the freight equipment owned and used by the Northern Pacific?

A. I am.

Q. Will you say whether or not the development in the construction of the boxcars of the Northern Pacific has proceeded along lines substantially similar to those indicated by Exhibit No. 2?

A. Very much the same. The dates of changes are in [fol. 2982] some cases different, and all of the new features as shown in the column here have been adopted by the Northern Pacific with the exception of, I believe, only two. We have no metal running boards on the boxcars and we have no steel floor plates as yet. Other than that I can find nothing in here that is different.

Q. Does the Northern Pacific now have in revenue service any cars with wooden underframes?

A. Yes, I believe so.

Q. You have some wooden underframe cars still in service?

A. Yes, sir.

Q. Are they restricted to particular localities?

A. Yes, particular service.

Q. What are the localities and service to which they are restricted?

A. They are used for outfits, work outfits, and there are some used in company material service.

Q. If they are handling company material or work outfits, they are not strictly in revenue service, are they?

A. No, that is right.

The Court: Do you have any such wooden underframe cars in revenue service?

A. I don't recall any. We did have, but I don't think [fol. 2983] so, now.

Mr. Mason: Will you refer, please, to exhibit No. 4, and state whether or not the development of the passenger carrying cars of the Northern Pacific has proceeded along substantially the same lines as indicated by Exhibit No. 4?

A. It is up to the point of the articulated car, articulated unit, or the single unit of stainless steel, we have none of that class.

Q. Your standard passenger carrying car is now the steel car of more or less conventional type, is it?

A. Yes, sir.

Q. Do you still run in main line passenger service any cars not of steel construction?

A. Yes, sir.

Q. In main line passenger service?

A. Yes, sir, under certain conditions.

Q. Do those cars ever leave the lines of the Northern Pacific?

A. No, sir.

Q. Does the Northern Pacific operate Pullman cars in its passenger trains?

A. Yes, sir.

Q. Are those of the same general type that are in use on [fol. 2984] other railroads as you have observed them?

A. Yes, with the exception that we do not have the newer stainless steel cars used in streamlined trains, we don't have streamlined trains.

Q. Do you operate Pullmans in through service jointly with other railroads?

A. Yes, sir.

Q. Will you refer, please, to exhibit No. 5, which shows the development of freight locomotives for the Southern Pacific?

A. Yes, sir.

Q. Do you have, or have you previously had in service on the Northern Pacific freight locomotives corresponding generally to those shown on Exhibit No. 5?

A. Well, generally so, yes. There are some types here that we don't have.

Q. Have you had a Consolidation Type of Locomotive, or do you now have one?

A. Yes, sir.

Q. And with tractive effort substantially the same as indicated here, or something different?

A. A little bit heavier than the heaviest shown here.

Q. I was referring to the Consolidation type, the two at the top of the sheet.

[fol. 2985] A. Oh, the Consolidation type.

Q. Have you had those locomotives in service?

A. Yes, sir, about the same type, a little bit less tractive effort.

Q. Have you used the Mikado locomotive?

A. Yes, sir.

Q. Do you use the 2-10-2 type?

A. No, sir.

Q. Either large or small, shown here?

A. No, sir.

Q. What is your heaviest freight locomotive now in service?

A. It is an articulated simple Mallett 2-8-8-4 wheel arrangement.

Q. And what is the tractive effort?

A. 140,000 without the booster, and 153,000 with the booster.

Q. As a 2-8-8-4 it corresponds in wheel arrangement to the A. C. 9 shown on this exhibit then?

A. Yes, sir.

Q. Do your locomotives use coal for fuel or oil?

A. We have a few oil-burning locomotives on the west coast, otherwise they are all coal burning.

[fol. 2986] Q. Are your coal-burning locomotives in main line service equipped with automatic stokers?

A. Yes, sir.

Q. Are they equipped with power reverse gears?

A. Yes, sir, practically all of them; they are not all of them, all the larger ones in main line service are.

Q. With super heaters?

A. Yes, sir.

Q. Feed water heaters?

A. Yes, sir.

Q. What type of brake equipment is applied?

A. I couldn't tell you that.

Q. Other than your articulated type of locomotive, what type of freight locomotives do you use principally in freight service?

A. The Mikado, we have two of the articulated Malletts though, we have a 4-6-6-4.

Q. What is the tractive effort of the 4-6-6-4?

A. About 104,000.

Q. Then your Mikados, what is their size from the standpoint of tractive effort?

A. About sixty-three, between sixty-three and sixty four thousand.

Q. Now, looking at Exhibit No. 6, have you any locomotive types in passenger service now or have you had in the [fol. 2987] past, which correspond or resemble those shown on Exhibit No. 6?

A. Yes, we have the ten-wheeler 4-6-0, we have the Pacific type, and the Golden State type as shown on this exhibit.

Q. You call the Golden State type by some other name, don't you?

A. Yes, we call it the Northern.

Q. It has the same wheel arrangement as this?

A. 4-8-4, yes.

Q. How do your 4-8-4 locomotives compare in tractive effort?

A. About 5000 more. It is a 69,000 locomotive.

Q. Your Pacific type locomotives, are they larger or smaller than those shown?

A. Very similar, within a few thousand pounds of what is shown here, I believe.

Q. Do you run refrigerator cars in the freight trains, on your railroad?

A. I didn't hear the question.

Q. Do you have refrigerators in the freight trains on your railroad?

A. Yes, sir.

Q. What is the identification of the refrigerator cars principally in use?

A. N. R. C. cars, Northern Refrigerator cars.

[fol. 2988] The Court: Mr. Mason, I don't presume you will be able to finish the direct examination.

Mr. Mason: No.

The Court: The court will be at recess until two o'clock.

(Thereupon, the court stood at recess until two o'clock, P. M. this day.)

[fol. 2989] 2 P. M., January 24, 1941

All parties being present as heretofore noted, proceedings were resumed as follows:

W. W. Judson resumed the witness stand.

Mr. Mason:

Q. Mr. Judson, do you have Pacific Fruit Express Company cars on your railroad from time to time?

A. We have a few of them, yes, but we don't use them ourselves.

Q. Do your N. R. C. cars resemble the P. F. E. cars?

A. I think so, yes.

Q. You once in a while operate cars of Southern Pacific ownership?

A. Oh, yes.

Q. Your Northern Pacific cars from time to time move over Southern Pacific lines, do they?

A. Yes, sir.

Q. About what are the length of the runs of your freight locomotives in main line service?

A. Well, it varies from 100 miles to 300 miles.

Q. Where would the 300-mile run take place?

A. We have one from Northtown, that is the freight terminal at St. Paul, to Mandan.

[fol. 2990] Q. That is in the western part of North Dakota, is it not?

A. Yes, it is 106 miles east of Dickinson shown on the map. That is our longest freight engine run and that is being operated now as an experiment and that is about 600 miles. The 300 miles I mentioned before was our regular operation, but this particular one is 600 miles.

Q. In a general way, Mr. Judson, will you describe the nature of the traffic carried by the Northern Pacific, first, eastbound on its main lines.

A. For the most part eastbound, it is grain, fruit, live stock, lumber. I believe that covers the principal commodities.

Q. Is that generally a through main line movement from origin territories to eastern destinations or interchange points?

A. Yes, sir.

Q. What is the general character of the westbound movement?

A. General freight westbound and a large empty car movement westbound.

Q. Is the movement of loaded freight heavier eastbound than westbound, generally speaking?

A. Heavier eastbound.

[fol. 2991] Q. Do you have any substantial westbound movement of empty refrigerator cars?

A. Yes, sir.

Q. As well as empty boxes?

A. Yes, sir.

Q. Do you handle any substantial amount of mineral traffic, products of mines?

A. Yes, sir, but not in through movement over the entire line of the railroad.

Q. You serve a mineral-producing territory in Idaho and Montana, do you not?

A. Yes, sir, and also in Minnesota.

Q. Do you have some coal movement out of North Dakota?

A. Yes, sir, a large coal movement.

Q. Does the Northern Pacific maintain or participate in schedules for the handling of freight eastward and westward?

A. I don't know as I understand your question.

Q. Do you have published over-all time schedules for freight from your western terminals to your eastern interchange points?

A. Yes, sir.

Q. For example, do you have a schedule from a point such as Seattle and Tacoma to the Twin Cities?

[fol. 2992] A. Yes, sir.

Q. Will you state the over-all time that you observe for those schedules from the western terminals to eastern points?

A. I would have to check that up; over the entire railroad I can't say offhand. It is comparable, though, to the schedules of the other northern lines.

Q. You maintain substantially the same scheduled over-all time as the Great Northern, for example?

A. Yes, sir.

Q. Do you maintain westbound schedules of the same character?

A. Yes, sir.

Q. And on a competitive basis with the Great Northern?

A. And the Milwaukee and the Union Pacific.

Q. Have you before you, Mr. Judson, an exhibit in one sheet entitled, "Northern Pacific Railway Company, Typical Examples of Freight Trains Handled," and so forth?

A. Yes, sir.

Mr. Mason: Your Honor, may we have this exhibit marked with the next number in order?

The Court: It may be marked.

[fol. 2993] The Clerk: Defendant's exhibit No. 207 for identification.

Mr. Mason:

Q. Did you prepare exhibit No. 207 or cause it to be prepared?

A. Yes, sir.

Q. From what sources was it prepared?

A. From the train sheet record of the train movements.

Q. As to the ruling grades shown in column D, from what is that taken?

A. From our track profiles and from the time cards.

Q. Do you have with you in the courtroom the dispatchers' train sheets to which you have just referred?

A. I have.

Q. And track profiles as well?

A. I have.

Q. Do you also have the current operating timetables?

A. I have.

Q. Does exhibit No. 207 for identification show all trains operating between the points indicated in columns A and B during the period referred to?

A. Yes, sir.

[fol. 2994] Q. That would include local trains which operate less than the entire distance as well as those which operate between the termini?

A. That is correct.

Q. Has the exhibit been compared against the underlying sources to determine its correctness?

A. Yes, sir.

Q. Will you say whether or not it is true and correct?

A. It is correct.

Q. I notice that the period shown as October 1 to 10, inclusive, 1939. Did you select that period for the purposes of this study?

A. Yes, sir.

Q. Why did you select it?

A. It is a representative period and it has been used quite frequently on our road for similar studies.

Q. Does it represent a fair cross-section of the traffic handled during the month of October?

A. Yes, sir.

Q. Does the month of October represent a fair cross-section of the traffic for the year?

A. October is a little higher than the other months of the year, the fall months are the heavier months.

[fol. 2995] Q. This would be a period, then, of better than the annual average of traffic, would it?

A. That is correct.

Mr. Mason: Have you any questions, Mr. Strouss?

Mr. Strouss: I have no questions.

Mr. Mason:

Q. Mr. Judson, are the underlying documents to which you refer available for the use of opposing counsel if they desire in examining the exhibit or for cross-examination?

A. Yes, sir, they are the original and only record.

Mr. Mason: Your Honor, we tender these records for the use of opposing counsel in connection with exhibit No. 207. We offer the exhibit in evidence with that number.

Mr. Strouss: The same objections as heretofore given to similar exhibits of foreign roads.

The Court: The objection is overruled, it may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 207.")

[fol. 2996] Q. Referring to Exhibit 207, Mr. Judson, are any of the districts shown in the "From" and "To" columns on the exhibit, columns A and B, double track territory?

A. Yes, sir.

Q. Which one?

A. From Lixingston to Logan is partially double track. From Helena to Missoula is partially double track, Missoula to Garrison is double track.

Q. And from Dickinson to Glendive?

A. That is single track.

Q. That is single track. Now, I will ask you to refer, in connection with exhibit 207, to Defendant's Exhibit 50. Does the heavy line shown on Exhibit 50 indicate the districts which are refefred to on Exhibit 207?

A. They do.

Q. Are any of these districts shown on Exhibit 207 helper districts?

A. Yes, sir.

Q. Will you indicate which ones?

A. Between Livingston and Logan, partial helper district, between Logan and Livingston partial helper district in the other direction, betwen Helena and Logan is partially [fol. 2997] a helper district, and Helena to Missoula is partially a helper district. That is all.

The Court: I notice, Mr. Judson, that practically all of the operations shown on this exhibit No. 207, are covering operations in the state of Montana. In view of the fact that your lines cover quite a number of states, is there any particular reason for selecting the Montana area rather than the other districts of your road?

A. The districts selected have been used in many studies on the Northern Pacific. The one between Dickinson, North

Dakota, and Glendive, Montana, is the district used because it represents the districts where we use our heaviest Mallett types. The district between Livingston and Missoula is a mountain operation.

Mr. Strouss: When you were answering as to double track, I notice there were certain places like Bozeman, Montana, to Logan, that would be double track, or would it? I noticed you said Livingston to Logan was partially double track. Now, Bozeman is in between.

A. Well, between Livingston and Bozeman is double track. Between Bozeman and Logan it is single track, alternate line operation, there are two lines between Bozeman and
[fol. 2998] Logan, a freight line and passenger line, but it is not double track.

Mr. Mason: Mr. Judson, while this exhibit relates only to the districts shown in heavy line on Exhibit No. 50, I will ask you whether or not trains in excess of 70 cars are operated on other portions of the System as well?

A. Yes, and to a greater extent.

Mr. Strouss: It is understood my objection is going to the testimony without it being repeated.

The Court: Yes, that is understood.

Mr. Mason: I think, with reference to your testimony on locomotives, no discussion was had of the Northern type. You show a Northern type locomotive on exhibit 207 in column E. What is the Northern type?

A. The Northern type is the 4-8-4 passenger locomotive. At this time, in 1939, the Northern type were used entirely in passenger service. We have since that time put them into freight service, and this particular one shown on exhibit No. 207 was a locomotive out of the shop which was being broken in or it handled a small train that happened to be probably a stock train, something of that kind.

Q. Did you state the wheel arrangement of these Mallett locomotives?

[fol. 2999] A. One is between Glendive and Dickinson, which is the larger of the two, is a 2-8-8-4 wheel arrangement. The one between Livingston and Helena and between Helena and Missoula is a 2-6-6-4.

Q. What is the tractive effort of the 2-6-6-4?

A. About 104,000.

Q. And the other, I think you stated, is something in excess of 130,000?

A. 140,000 and 153,000 with the booster.

Q. These are an articulated type?

A. Yes, sir.

Q. Have you before you, Mr. Judson, a statement in one sheet entitled "Northern Pacific Railway Company, Maximum Number of Cars Handled in Various Main Line Passenger Trains, October 1st to 10th, 1939, Inclusive?"

A. I have.

Mr. Mason: May we have this exhibit marked as defendant's Exhibit No. 208 for identification?

The Court: It may be marked for identification.

The Clerk: Defendant's Exhibit No. 208 for identification.

Mr. Mason: Did you prepare this exhibit, Mr. Judson, or have it prepared?

A. I had it prepared and checked it.

[fol. 3000] Q. From what sources was it prepared?

A. From the train sheet record of the train movements, and also from the conductors' reports of cars sent out and picked up.

Q. Are those records likewise available in the court room?

A. The train sheet records are.

Q. And is all of the information shown on the exhibit likewise shown in detail on the train sheet records?

A. Yes, sir.

Q. Has the exhibit been compared with the original records to determine its correctness?

A. Yes, sir.

Q. Will you state whether it is true and correct?

A. It is.

Q. As to these mileages, are they likewise shown?

A. Yes, sir—on the train sheet?

Q. Yes.

A. No, they would have to be added up off the train sheet. They don't show any one mileage as shown on the statement.

Q. From Fargo to Billings, you would have to add up from three or four train sheets, for example?

[fol. 3001] A. Yes, sir.

Mr. Strouss: That is shown on your timetable, I take it.

A. Yes.

Mr. Mason: Why do you select these particular districts, as shown in column B?

A. May I correct one of my statements?

Q. Yes.

A. This exhibit is a System exhibit for the entire system. The train sheets are not here for the entire system. I will have to correct that, they are here for the freight exhibit and not for the passenger exhibit.

Q. Have you the passenger conductors' reports covering these trains?

A. No, sir, I haven't.

Mr. Strouss: I will say to you I will waive that objection to that.

Mr. Mason: Very well.

Q. Now, why did you select these particular points to show the study of the train; for example, you show one train, but show its consist from point to point over eight different districts?

A. These are the places at which the train was broken up and cars either taken from it or added to it.

[fol. 3002] Q. Are these the points at which the changes in consist are customarily and regularly made, if made at all?

A. Yes, sir.

Q. Did you likewise make the selection of the period stated on exhibit No. 208 for identification?

A. Yes, sir.

Q. Why did you select this particular period for study in connection with passenger trains?

A. Well, because we just took the same period that we took for the freight.

Q. Is the period October first to tenth heavier than average period, so far as concerns passenger traffic?

A. It is lighter than average.

Q. Is it fairly representative of the month of October?

A. It is.

Q. Now, are the trains shown as No. 1 and 2 companion trains, one eastward and one westward?

A. Yes, sir.

Q. What is the name of that train?

A. That is what we call the North Coast Limited.

Q. Are the trains No. 3 and 5 likewise companion trains?

[fol. 3003] A. They are.

Q. What is the name of those trains?

A. Formerly called the Alaskan, but we don't use that name any more, we don't have any name for it now.

Q. Are there any other through transcontinental trains from the Twin Cities to Seattle operated over the Northern Pacific?

A. No, sir.

Mr. Mason: Have you any questions, Mr. Strouss?

Mr. Strouss: No.

Mr. Mason: I want to say we appreciate the courtesy of opposing counsel in waiving the production of the underlying passenger train records for this exhibit. We offer the exhibit in evidence as Defendant's Exhibit No. 208.

Mr. Strouss: The same objection, except the objection as to the competency is waived.

The Court: Overrule the objection. It may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 208.")

Mr. Mason: Mr. Judson, do trains Nos. 1 and 2 carry head-end cars as well as passenger-carrying cars?

A. They do.

[fol. 3004] Q. Now, you show, for example, No. 2, Butte to Billings, with a consist varying from 15 to more than 17 cars in that train over that stretch. How many cars, generally speaking, would be other than passenger-carrying cars?

A. Oh, on the average of about four.

Q. Does that proportion generally obtain throughout the run of the train from Seattle to St. Paul?

A. No, I think the through run will probably average nearer three on the through run.

Q. Does the train also carry coaches?

A. Yes, sir.

Q. And a dining car?

A. Yes, sir.

Q. And standard or tourist Pullmans?

A. Both.

Q. Do trains Nos. 3 and 4 carry the same class of equipment?

A. No, sir, they don't carry any standard equipment on the through run, they don't carry a diner, they have a cafe

coach instead, and they do not have any observation car.

Q. Do Nos. 3 and 4 carry any greater number of head-on cars?

A. Yes, sir.

[fol. 3005] Q. What sort of weather do you get along your line across North Dakota, Montana, and Minnesota in the winter-months?

A. Well, it is very severe. I have railroaded in Montana at 56 below.

Q. Is that a regular experience every winter?

A. No, that is an exceptional case.

Q. Does the temperature descend below zero frequently during the winter?

A. Yes, I have seen it for more than a month at a time when it never got above zero.

The Court: You don't have Tucson weather in your territory?

A. No, not anywhere near approaching it.

Mr. Mason: I notice that you have at times here operated the North Coast Limited with more than 15 cars though not, according to this exhibit, 208, during the month of January or February. Do you operate in the winter months with consists similar to those shown on Exhibit 208?

A. We do.

Q. Do you make any limitation of the length of your passenger trains because of the cold weather?

A. Yes, to make our time we have limited it to twenty [fol. 3006] cars out of Twin Cities. We have that quite frequently, but that is to enable us to make the scheduled time.

Q. Is that for the purpose of reducing tonnage to conform to the rating of the locomotive?

A. Well, it is more to comply with the weather conditions. The locomotive will handle more, but when the wind is blowing, and snowing hard, we cut the tonnage down so as to enable us to make the time.

[fol. 3007] Q. Is that because of wind resistance?

A. Partly.

Q. Do you make any reduction of your passenger trains to any particular length because of the problem of heating the rear cars of the train?

A. No, because we in general hold them down to twenty cars and we have never had any trouble with that number.

Q. Mr. Judson, in general what considerations determine the lengths of the freight trains that you operate?

A. There are several factors, the physical characteristics of the districts over which they operate; the class of train, that is, whether it is an expedited freight train or otherwise; and the business offered for handling and the weather conditions.

Q. You speak of the character of the district over which it is operated. By that you mean the grades that you are to encounter?

A. Yes.

Q. Does that mean you adjust the tonnage of the train in accordance with the available power to handle it?

A. Yes, sir.

Q. And that, in turn, determines the length?

[fol. 3008] A. That is correct.

Q. Now as to the matter of expedition, do you again adjust the tonnage in accordance with the engine rating for faster or slower movement?

A. Well, on what we term our time freights we don't run as heavy a tonnage as we do on what we call the drags, coal drags, with the same power.

Q. Will you say whether or not the adjustment of the train is a matter of adjusting the tonnage rather than as to the number of cars?

A. It is entirely a tonnage proposition. Of course two trains of the same tonnage would make some difference but we adjust and operate on a tonnage basis.

Q. Not to the number of cars?

A. No, sir.

Q. You spoke of weather conditions, do you have in mind wind resistance as a factor in the operation?

A. Wind resistance, snow, slippery rail, sleet, all weather conditions that would tend to retard a train.

Q. Will extreme cold weather cause you to reduce tonnage?

A. Yes.

Mr. Mason: I think that is all, thank you, Mr. Judson. [fol. 3009] Do you wish to cross-examine now or would you rather have the train sheets first, Mr. Strouss?

Mr. Strouss: I prefer to see the train sheets first.

Mr. Mason: Your Honor, may the record show we have handed to opposing counsel the train sheets which form the basis for the information generally shown on exhibit No. 207 together with the operating timetables of the Northern Pacific.

The Court: The record may so show.

Mr. Mason: And that Mr. Judson is to be recalled for cross-examination after Mr. Strouss has had the opportunity to examine those documents.

(Witness excused.)

H. C. Garverick was called as a witness in behalf of the defendant and being first duly sworn testified as follows:

Direct examination.

By Mr. Mason:

Q. Will you state your name and residence to the reporter?

A. H. C. Garverick, San Francisco.

Q. Are you employed by the Southern Pacific Company? [fol. 3010] A. I am.

Q. In what capacity?

A. At the present time I am connected with the Bureau of Transportation Research.

Q. Have you been employed by the company as a timekeeper in the accounting department?

A. For the past thirty-one years.

Q. Were you ever timekeeper at the headquarters of the Tucson division?

A. I was.

Q. What years?

A. I entered the service in the year 1910 at Tucson as an accountant and remained in that position until some time in the year 1912. I was timekeeper from 1912 to 1915; 1915 to 1918 as head timekeeper; 1918 to 1922, back to San Francisco in the auditor of disbursements office as an accountant; from 1922 to 1927 I was timekeeper on the Sacramento division; from 1927 to 1932, assistant head timekeeper, Sacramento division. In the year 1932 they consolidated seven timekeeping divisions under the supervision of the auditor of disbursements at San Francisco,

and I was transferred to San Francisco and made head clerk in charge of one of the timekeeping subdivisions [fol. 3011] which was broken up into four or five divisions, one division being train and engine and yard; another division being broken up into maintenance of way; another division broken up into motive power and car department; and another division broken up into station force and telegraphers.

Q. Will you continue with your experience up to date?

A. That was in 1932. From 1932 to the present date I have been assigned various duties. I was disengaged temporarily from my duty as head clerk to that of clerk in charge in the preparation of statements for the Federal coordinator and in the preparation of back payrolls. Right at that time there were numerous decisions from labor tribunals which required the payment of back pay to both train, engine, and yard men for all divisions, I might say, with the exception of the Tucson and Rio Grande.

Q. That was computed at El Paso, I take it?

A. They were consolidated, Tucson and Rio Grande divisions were consolidated practically about the same time at El Paso. It was not in the jurisdiction of San Francisco, due to the long distance in preparing payrolls, and a short payroll period time in getting out pay checks, as [fol. 3012] the Arizona law was shorter than the California.

Q. Since 1932 and up to 1939 have you been engaged in a series of special duties in the office of the auditor of disbursements in connection with payrolls and payroll accounts?

A. Payrolls, payroll accounts, special statements, also the initial preparations for the government in the pension department and setting up their wheels of machinery for the railroad pension fund; also for the state of California for the California unemployment insurance.

Q. Have you in the course of your experience become familiar with the manner in which the rates of pay for trainmen and enginemen are arrived at and applied in computing their wages?

A. I have been in constant touch with the trainmen and enginemen and yardmen's agreement since I entered the service of the railroad.

Q. Have you used the provisions of those agreements for the purpose of setting up the wages of the individual trainmen and enginemen?

A. Yes, sir, I have.

Q. Are you familiar with the rates of pay heretofore and presently in effect in the various districts of the Tucson and Rio Grande divisions?

A. I am.

[fol. 3013] Q. Have you before you a statement in one sheet entitled, "Basic Rates of Pay for Standard Days and Certain Runs on the Tucson and Rio Grande Divisions"?

A. I have.

Mr. Mason: May we have this statement marked as "Defendant's Exhibit No. 209"?

The Court: It may be marked.

The Clerk: Defendant's exhibit No. 209 for identification.

Mr. Mason:

Q. Did you prepare exhibit No. 209 for identification, Mr. Garverick?

A. I did.

Q. From what sources?

A. This exhibit was prepared from the working agreements of both the train and enginemen, current train and enginemen's agreements in effect as of today.

Q. Does this undertake to show the rates of pay as in effect upon the various districts of the Tucson and Rio Grande divisions for the various services which are indicated here?

A. It does.

Q. Do you have the basic agreements from which this information is taken available in the courtroom?

[fol. 3014] A. Yes, sir, I have.

Q. Is the exhibit merely a summary of the provisions as they appear in those agreements?

A. Yes, sir, it is.

Mr. Mason: I take it that opposing counsel will not require the production of these basic agreements, they are matters of very wide circulation.

Mr. Strouss: No.

Mr. Mason: If you do not object, I will supply the witness's copy to the judge so he may follow the testimony.

Mr. Strouss: All right.

Mr. Mason: Your Honor, I am placing before you the agreements governing the conductors, trainmen, firemen, and engineers for the Southern Pacific Company which are currently in effect and I will ask the witness, are the agreements which you produced and which I have placed before the Court the agreements for the several crafts; those four crafts mentioned, which are now in effect?

A. The agreements are still in effect.

Q. Are the rates of pay which are in effect today and which were in effect in 1938 shown in the copies which have been placed before the judge?

A. I might state that the conductors, as shown on the [fol. 3015] face, will show that it was in effect somewhere in 1939. The trainmen are in 1939, the firemen are in 1939, and the engineers is in process of being printed today with the current rates. You will see that the rates shown in the engineers' agreement dated back to about 1928 and there have been several increases since then. However, there have been tabulations put out by the management to bring those rates up to date, and it has been made a part of that agreement until it is made in its entirety in book form.

Q. Does the copy which was handed to the Court contain the rates which were current in 1938?

A. With the exception of the engineers' agreements.

Q. Your copy of the engineers' agreement has not been revised?

A. No, sir.

Q. There is nevertheless a revision of the printed rates, as shown in the engineers' agreement, which is effective as of 1938 and to date?

A. Yes, sir, I have a mimeographed copy of the new rates.

Mr. Mason: Mr. Strouss, I think we both understand that the printed agreement has been revised to reflect certain in- [fol. 3016] creases which became effective in 1937 and such other intermediate increases as may have been made.

Mr. Strouss: Yes.

Mr. Mason: Mr. Garverick, there are on the face of exhibit No. 209 for identification certain calculations from the basic figures which appear in the agreement, are there not?

A. Yes, sir, there are.

Q. For example, take line 3, the first item of money in column A. What does the figure in line 3, column A indicate?

A. That will represent the compensation to an engineer and fireman on a consolidation engine who have traveled 123 miles in through freight service from Yuma to Gila.

Q. Is there any figure on the exhibit which you multiply in order to obtain that figure in line 3, column A?

A. Yes, sir.

Q. What is that figure?

A. Take line 1, the basic (through), $15.04 100 miles; 15.01 per mile and multiply it by 123 you will develop $18.46.

Q. Does the figure in line 1 represent the payment to the engineer and the fireman for the service in operating the engine 100 miles?

A. Yes, sir, it does;

[fol. 3017] Q. Is that the basic day?

A. That is the basic day, one hundred miles or eight hours.

Q. Suppose that the operation is in local service, do you take the figure in line 2?

A. Line 2, which is 15.93 or $15.93 per 100 miles and multiply it by 123, as shown in item 4 between Yuma and Gila, and you will develop $19.59 for the entire trip to an engineer and fireman.

Q. I notice that you show a variation in the figures of basic wages, taking line 1, basic (through), in the various columns A to I, inclusive. Why is there that variation or increase from one column to the next?

A. Engineers and firemen are paid the rates shown in their agreement in accordance with the weight on the drivers of the various classes of power that they are operating. For instance, in column A there is a Consolidation engine; column B is a Mikado; column C is an F-1 type; column D is a Mountain type; column E is an F-3 type; column F is an F-4 type; column G is an F-5 type; column H is an SP type; column I is an AC-8 type, and as they vary with the weight on the drivers the rates fluctuate.

[fol. 3018] Q. Does the rate increase as the weight on drivers increases?

A. It does.

Q. And is that according to blocks or brackets of weights?

A. Yes, it is.

Q. For instance, is there a block or bracket between 200 and 250 thousand pounds?

A. That is the way the agreement is worked around a fifty-thousand-pound differential.

Q. If the locomotive on which the engine crew is running weighs 240,000 pounds on the drivers, they will receive the 200 to 250 thousand pound bracket, will they?

A. That is correct.

Q. If the weight on drivers is 240,000, they will be in the same bracket?

A. They will be in the same bracket.

Q. You show also a basic wage for trainmen in column K. Is that calculated from the conductors' and trainmen's agreements?

A. Yes, sir, it is.

Q. Does this include the figures of the conductor as well as the brakeman?

A. Item 1 will include the conductor and three brakemen.

[fol. 3019] Q. Is there a variation between through and local rates in the basic?

A. That is correct.

Q. How do you obtain the figure, for example, in line 3, column K?

A. If you will refer to the bottom of the form under the caption "Conductors' and trainmen's rates of pay," it will be noted that the freight districts on the Tucson division vary in rate per 100 miles or rate per mile. The rate in item 4 will come under the district Yuma to Gila, Gila to Phoenix, Gila to Tucson, or Phoenix to Tucson.

Q. You group all of those in one group as west of Tucson?

A. West of Tucson.

[fol. 3020] Q. Then, in the lower bracket you show the rates for the conductor and the rates for each trainman, do you?

A. Yes, sir.

Q. And you group them in line 1 as one round sum for the four men?

A. Yes, for the miles travelled between those two freight termini.

Q. And the figures then in line 3 are simply a multiplication of 123 miles times the rate shown, taking 100 miles shown in line 1?

A. Yes, sir.

Q. And the same for the others down to and including line 10?

A. That is correct.

The Court: Did I understand you to say that the figure over in column K represented the combined pay of the conductor and two brakemen?

A. Line K calls for three brakemen. You will notice in column J, it covers two brakemen.

Q. In other words, in this particular territory west of Tucson, there are no runs that only employ two brakemen?

A. No, there are no runs that employ only two brakemen in that territory.

Mr. Strouss: That might or might not be true, might [fol. 3021] it not?

Mr. Mason: It would depend on the length of the train. It is not figured here, Mr. Garverick, as I understand.

A. It would be possible that they could use two, but they always assign three brakemen.

Mr. Strouss: If you had a train under 40 cars, you wouldn't assign three brakemen?

A. It would have to be what we term a made-up crew. All assigned crews are assigned with a conductor and three brakemen, if they only had the caboose.

Mr. Mason: Answering the Judge's question, the figures in column K are all for the four men comprising the train crew as distinct from the engine crew?

A. That is correct.

Q. Now, turning to the district, the district shown in lines 21 and below, did you make the computations in the same manner?

A. I did.

Q. And likewise for lines 26 and 27?

A. Yes, sir.

Q. And these figures for helper crews in lines 24 and 25, are they on the basis of actual miles?

[fol. 3022] A. That is on the basis of just actual miles.

Q. Then your notation indicates a certain minimum payment?

A. Yes, ones [illegible] would mean a day's pay.

The Court: Mr. Garverick, you testified that the rate of pay of the engine men, which, as I understand it, includes

the engineer and fireman, is predicated upon the weight of the locomotive, that is, the weight on the drivers. Does the weight of the locomotive have anything to do with the basic pay of the conductor?

A. No, it doesn't.

Q. Does the tonnage of the train have anything to do with it?

A. No, it doesn't.

Mr. Mason: As I understand it, Mr. Garverick, the exhibit is divided between lines I and J into two entirely separate blocks and all of the information to the left of line I, except, of course, the columns which indicate the districts, relates entirely to engineers and firemen?

A. Yes, sir.

Q. And all of the information in column J and K relates to trainmen?

A. Yes, sir.

Q. Do I understand, Mr. Garverick, that the agreement [fol. 3023] provides a different basic rate for 100 miles for conductors and brakemen in the territory east of Tucson than prevails in the territory west?

A. Yes, there is quite a differential in there as shown at the bottom of the exhibit.

Q. You show also the rates for deadheading where these employees are moved to points to commence work?

A. Yes, sir. I might call your attention, that a conductor working between Yuma and Tucson receives $7.14 a hundred miles. Now, if that train conductor would work east, Tucson to Lordsburg, he would receive $7.43 for one hundred miles.

Q. That is in through freight service?

A. Through freight service.

The Court: The only reason for that is, that that is the agreement between the brotherhoods and the railroads?

A. That is the agreement. It has been decreased and increased as increases have been paid through different wage controversies.

Mr. Mason: Has the exhibit been compared against the agreements to determine its correctness, Mr. Garverick?

A. It has.

[fol. 3024] Q. Will you say whether or not it truly and correctly reflects the rates of pay shown in the agreements

and, as to the particular districts to which reference is made, the rates payable for the services indicated according to the agreements?

A. I have checked it and it is absolutely correct.

Mr. Mason: Have you any questions, Mr. Strouss?

Mr. Strouss: No questions.

Mr. Mason: We offer the exhibit in evidence as defendant's exhibit 209.

Mr. Strouss: No objection.

The Court: It may be admitted.

(The document referred to was received in evidence and marked, "Defendant's Exhibit No. 209.")

The Court: Well, now, Mr. Garverick, I noticed east of Tucson, as shown by this exhibit, at least in two areas, the El Paso-Lordsburg and the El Paso-Strauss turnaround, that apparently trains are operated with conductor and two brakemen?

A. Yes, between El Paso and Strauss and between El Paso and Lordsburg.

Q. That again is a matter of agreement.

A. That is a matter of agreement and also state laws.

Mr. Strouss: Of course, we are getting into something [for 2025] now at this time—as a matter of fact, I think counsel will admit there is no full-crew law in New Mexico.

Mr. Mason: I understand there is no full-crew law in New Mexico, and trains may be operated in New Mexico with less than three brakemen, but the showing is merely of the amount which would be payable without undertaking to discuss what the requirements might be, the amounts payable for those particular services.

The Court: Then the answer to it, Mr. Strouss, is the difference in the laws of the two states?

Mr. Strouss: I assume it has some effect.

Mr. Mason: I didn't undertake to qualify the witness as to whether we do operate or do not operate. The figures are merely here to show that those payments would be made if the circumstances arose in that way.

Mr. Strouss: Yes, I understand.

Mr. Mason: Mr. Garverick, I ask you to refer to the exhibit heretofore marked as No. 198 for identification when Mr. Sines was on the stand. In the course of his testimony,

Mr. Sines stated that certain of the entries on this exhibit had been made by yourself. Now, will you point to the portions of that exhibit which represent entries made [fol. 3026] by you on the original white work sheet A, of which this is a reproduction?

A. All entries were made by me personally from columns 16 to 27 inclusive.

Q. Now, from what source did you take the information from which you made the entries in the actual half of the sheet, that is, the half above the line which crosses the sheet just above the word "redispatch" in columns 16 to 27?

A. From Form 2370, time returns and delay reports, originally rendered by either the conductor or the engineer who made the trip.

Q. Are those original time returns and delay reports covering the operation of these actual trains?

A. That is correct.

Q. You took simply the amounts shown on the face of those time returns and delay reports as claimed by the conductors and engineers as wages of themselves and crews?

A. That is correct.

The Court: Do I understand from that, Mr. Garverick, that each day as the trainmen complete their day's work, they turn in a slip with the number of hours that they have worked, and the amount of pay that they claim is due?

[fol. 3027] A. Yes, turn in what we term a Form 2370 Time Return and Delay Report.

Mr. Mason: I show you, in connection with the Court's question, sheet 5 of Exhibit No. 195. Will you advise the Court whether that is the form to which you have reference?

A. That is the form that I have reference to, an identical form for both engineer, trainman and yardmen.

Q. Is that sometimes known as the time slip?

A. Known as the time tag, as we call it, or time slip.

The Court: That answers the question.

Mr. Mason: Was the information shown in the columns to which you have referred in so far as exhibit 198 for identification is concerned checked against the original time cards and delay reports?

A. They were originally transcribed from the 2370 time return and delay report and checked against the current rates of pay.

Q. Did you perform the same character of work on each of the other white work sheets A, which were prepared as testified by Mr. Sines?

A. I did.

Q. Using in so far as the actual half of those sheets is [fol. 3028] concerned the original time returns and delay reports?

A. Yes, sir.

Q. Now, from what source and in what manner did you make the entries in the column 16? Taking column 16 as an example in the half of the exhibit below the line separating the actual from the redispatch.

A. Well, the first information which we must have at hand in making allowances for train engine is the class of power that they are operating with and the first item under the redispatch, this engineer and fireman used a 4100 class AC-8 engine. That engine weighing more than 550,000 pounds on the drivers calls for a rate that I have indicated on Exhibit 209 as $17.82 per 100 miles or 17.82 cents per mile for an engineer and a fireman. We multiply by the distance travelled, which was 164 miles from Tucson to Lordsburg, will develop $29.23.

Q. Is that the figure shown for the AC-8 Class locomotive in column 1, line 13 of exhibit 209?

A. That is correct.

Q. Does that same explanation apply to each of the other amounts shown in column 16 as the basic wages for the engine crew?

[fol. 3029] A. That is correct.

Q. You say "Train engine." What do you mean by "train engine?"

A. Well, the distance between Tucson and Lordsburg from station to station is 164 miles.

Q. And the train engine, I take it——

A. —is the main engine.

Q. Which handles the train?

A. Which handles the train.

Q. Over the entire district?

A. Or an engine which is double-heading the entire distance.

Q. Now, how do you arrive at the amount shown, the first amount, for example, shown in column 19 under the redispatch, the amount of $15.99?

A. That represents the amount of money for compensation allowed an engineer and a fireman.

Mr. Strouss: I want to make one little objection here. We are, of course, reading into the record now parts of this exhibit, which is only an exhibit for identification and not admitted in evidence.

The Court: Yes, the objection on that ground is perfectly good.

Mr. Mason: I simply used the figure "$15.99" without associating it with anything in particular.

[fol. 3030] Mr. Strouss: I have no objection to using it to identify it, but I don't want you to put it in to show what the exhibit shows.

The Court: I will sustain the objection on that ground as to any concrete figures that may be used.

Mr. Mason: We will go to another amount in the same column. I only want to make the explanation and not to establish these figures of record until the exhibit is offered.

Q. Take the second amount shown in column 19. How did you obtain that?

A. That is obtained by getting the rate applicable to a 5000-class engine in helper service.

Q. The rate for a 5000-class locomotive in service, as indicated by line 1, column H, of exhibit No. 209 is $15.99?

A. That will also apply to column H, did you say?

Q. Yes.

A. An SP-type engine $15.99.

Q. Now, do you use the same multiplier to obtain the figure which is indicated here, this second figure in column 19 in exhibit 198?

A. The same calculation I referred to in arriving at basic rates under column 16.

[fol. 3031] Q. You multiply the rate times miles traveled?

A. That is true.

Q. And if the figure happens to be less than $15.99, it means that the miles traveled were less than a hundred?

A. I will have to go into more detail to explain what those figures are. It is simply the amount of money allowed an engineer and fireman on the face of this sheet,

this exhibit, for the miles that are shown that he helped at the rate and the class of power used.

Q. Now, in obtaining the wages of trainmen, did you use the rate between Tucson and Lordsburg times the miles?

A. That is correct.

Q. For both the actual and the redispatched?

A. That is correct.

The Court: We will take our mid-afternoon recess at this time.

(Thereupon, a short recess was taken, after which, the witness was recalled to the stand, and proceedings were resumed as follows:)

The Court: You may proceed.

Mr. Mason: Mr. Garverick, in making the entries in the lower half of exhibit 198 for identification, did you follow [fol. 3032] the same process for each of the other entries that you have described for the particular entries you have already referred to?

A. Yes, I did.

Q. And referring to the other white work sheets A, it has been testified here that there were altogether 943; and somewhat less, or 848, that related entirely to freight train operation. Did you follow the same methods on each of the other white work sheets, using the same sources as you have described in connection with Exhibit 198 for identification?

A. I did.

Q. Did you check the computations in so far as they applied to the redispatch portion of the sheet?

A. Yes, I did.

Q. When you had finished your work on the white work sheets A, did you turn them over to Mr. Sines?

A. Yes, I did.

Q. Will you say whether or not the entries in so far as they were made by you on the white work sheets A, and particularly on Exhibit 198 for identification are true and correct?

A. To the best of my ability.

[fol. 3033] Q. In column 17 and again in column 24 on exhibit 198 for identification, under the actual, you show

certain amounts as variable amounts. Did you make those entries yourself?

A. I did.

Q. Now, what is represented by these variable amounts. By the way, are those also taken from the time returns and delay reports?

A. They were.

Q. What do they represent?

A. They represent initial or terminal delay, switching, overtime, roundhouse miles to and from the roundhouse, held-away-from-home terminal time.

Q. These are amounts not directly associated with the operation of the train from the starting point to the finishing point other than, of course, the overtime?

A. That is correct.

Q. Was it necessary to make any calculations or simply to copy from the time returns and delay reports?

A. Simply copy.

Mr. Mason: That is all. Thank you, Mr. Garverick. Do you wish to cross-examine him?

Mr. Strouss: No cross-examination.

The Court: Step aside. Call your next witness.

[fol. 3034] Mr. Mason: Your Honor, at this time, the foundation having now been laid, we offer defendant's Exhibit 198 in evidence as typical of the white work sheets A, which have already been tendered to and delivered to Mr. Strouss for his examination and use.

Mr. Strouss: We renew the objection heretofore made to this exhibit.

The Court: Do either of you care to be heard on it? I am not asking for any lengthy argument; I prefer to hear from Mr. Strouss. When the matter was originally presented here, of course, it wasn't actually tendered in evidence, it was marked for identification. We had some discussion about it. Now, after two days there has been considerable evidence introduced explaining and clarifying the exhibit. It seems to me we have come down now to the basic question as to whether a redispatching study and the result thereof is admissible. The upper portion of it, of course, is actual operations. I take it, you have no objection to that.

Mr. Strouss: No, except, of course, the upper part doesn't contain all of the information which we feel should be on there. I mean the matter stated there, we don't question [fol. 3035] that that is correct tabulation of those matters from the train sheet, but using that and I suppose putting on the same sheet for the purpose of comparison a redispatch, which, of course, must be the opinion of the persons who redispatched the trains as to what would have been done, and certain facts which, certainly from the evidence as we see it, would be necessary for the redispatching of that train are not in here. Part of the facts are stated, but not all of them, tonnage for one thing is not shown on here. It is a matter which, as the dispatchers have stated, is necessary to be considered in redispatching trains. Now, we are assuming that the tonnage in these redispatched trains are tonnages which those trains with the power here shown would carry over that territory. The facts are not in there to support that, it is assuming that there are facts without putting the evidence in there to show them. I don't think the foundation has yet been laid for the admissibility of the exhibit.

Mr. Mason: The objection now made appears to be a criticism of its value rather than as to its admissibility. First of all, as to the objection to the actual, of course, the underlying train sheets which are the original records— [fol. 3036] The Court: To save time on it, Mr. Mason, the Court's mind is pretty well made up. It seems to me now that the basic testimony from the dispatchers who participated, together with the evidence of the last witness, the items of pay, that the exhibit is now admissible in evidence. I think your statement is true that probably some of these objections go to the weight of it rather than to its admissibility. As to just how valuable a redispatching study will be to the Court, of course, that is difficult to say at this time. Evidently, a lot of time and effort have been put into it, and there have been brought to the Court the basic underlying sheets, the data which constituted this study, and for what it is worth, I am going to admit the exhibit. The objection is overruled.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 198.")

(Discussion between counsel off the record.)

Mr. Mason: The record may show that Mr. Herrell and Mr. Cassady are excused pending recall.

Mr. Strouss: Yes.

W. P. Herbert resumed the witness stand for

Cross-examination.

[fol. 3037] Mr. Strouss: Mr. Herbert, I think in your direct testimony you testified in preparing your exhibits 177, 178, 179, 180, and 181 you used the unit of cost per gross ton-mile rather than train-mile because a train-mile is an inconstant unit, is that correct?

A. Yes, a train-mile as a unit is variable.

Q. It has factors, in other words, such as the character of the mile, that is one of the reasons that it is variable?

A. No, it is more the fact that the train in one instance might have one car and the next instance have 160 cars and which thereby renders it unfit as a unit of measure.

Q. Of course the gross ton-mile does vary according to the difference in the character of the mile?

A. The gross-ton-mile will be a gross ton-mile regardless of what kind of a mile it might be operated over.

Q. But its cost will vary according to the difference in the character of the mile?

A. Yes, its cost is something else. As to the cost per gross ton-mile or per thousand gross ton-miles, as my exhibits show, the cost on a thousand gross ton-miles is flex-[fol. 3038] ible, whereas the cost per train-mile is not flexible.

Q. The cost would vary according to the character of the loads?

A. Yes, per gross ton-mile, yes.

Q. Whether your cars were loaded to capacity or not. I mean if you have a car loaded at full capacity and one at 50 per cent capacity that would affect the cost per gross ton-mile?

A. I don't see just how you mean it will affect the cost per gross ton-mile.

Q. I was asking whether it would or not.

A. Yes, I believe it will to some extent because the more load, the more trailing load as we sometimes call it, be-

hind the locomotive and tender the less cost per thousand gross ton-miles we will obtain.

Q. The factors which enter into the cost per gross ton-mile, I believe you testified, are fuel, enginemen's wages, trainmen's wages, engine house, and other locomotive supplies, train supplies and expenses?

A. Yes, sir.

Q. Those are the six items which are considered in that cost?

A. Yes, sir.

Q. You take the total of the six items for all freight [fol. 3039] operations and divide by the total gross ton-miles?

A. Yes, sir, the total gross ton-miles excluding the weight of the locomotive.

Q. Of course, fuel being an item of that cost it means fuel for all freight operations, doesn't it?

A. All freight train operations, yes.

Q. Loads and empties?

A. Yes.

Q. So that the number of empties would enter into that to some extent and affect the cost?

A. Yes, it would.

Q. The amount of locomotive-miles required and used in helper service, that would affect the cost?

A. In this exhibit it would have a little effect in the cost of fuel oil.

Q. What about enginemen's wages?

A. Yes, it would have an effect there, too.

Q. Whenever a locomotive is used in helper service, it is only considered a helper when it is cut into the train and helping, isn't that correct?

A. The cost of helper service is the entire cost.

Q. I mean so far as locomotive-miles are concerned, locomotive-miles in helper service are the miles when it is [fol. 3040] actually cut into the train helping and when it is cut out and returns to a station it is running light, those are locomotive-miles light, isn't that right?

A. Yes, they are light miles, but this exhibit deals with gross ton-miles and the freight train cost.

Q. I understood you to say on one exhibit you had added in the last four years the locomotive ligh' because they were included in previous years?

A. They were included on all the years but they had been excluded on the 521's in that computation showing gross tons per train-mile.

Q. That is what I meant; they were included in previous years on the 521's but for these four years had been excluded?

A. Yes, but I included them on my exhibit No. 179.

Q. Then wouldn't a helper engine returning to its station after it is cut out of a train, the locomotive-miles would be classed as light?

A. Yes.

Q. That cost would also be a cost that would enter into this?

A. Yes.

Q. Road switching costs. Road switching as distin- [fol. 3041] guished from yard switching is when the train crew itself does the switching, is that correct?

A. Yes, that is correct.

Q. Road switching would be an item that would enter into those costs?

A. Yes.

Q. And the crew and engine fuel, engine supplies, that might enter into it and would be included there?

A. Yes, they would.

Q. What about volume or density of traffic?

A. In what way?

Q. I mean if the traffic is not available so that your locomotive is not loaded to capacity, that would have some effect upon costs?

A. You mean in ordinary territories or territories restricted to 70 cars?

Q. In territory where the cause of your engine not being loaded to capacity is the lack of traffic?

A. Yes, if the cause is the lack of traffic then that lack of traffic would have some effect.

Q. And, of course, efficiency of the locomotive itself?

A. Yes.

Q. Some locomotives might be more efficient than others [fol. 3042] and use less fuel?

A. Yes, there are various things that affect costs such as that.

Q. And the ratio of branch line to main line?

A. Yes, branch line has its effect or a slight effect. In this particular exhibit it has a very slight effect.

Q. Do you have your 521's here?

A. In the courtroom?

Q. Yes.

A. No, I do not. I am sorry.

Mr. Strouss: I didn't think when I said I could cross-examine Mr. Herbert that I didn't need those.

Mr. Sines: Which ones do you want? I can get them in five minutes.

Mr. Strouss: I want them for the two divisions for the year 1937.

Q. With reference to this density of traffic, there are two main lines, one of which carries heavy traffic and the other light. Of course, the line that carries the light volume of traffic would affect the cost on the other main line where they are both considered together?

A. They were both considered together, on the Tucson division I suppose you are talking about.

[fol. 3043] Q. I am speaking about the Phoenix line and the Maricopa line. It is a fact that on the Phoenix line you don't operate your through freight trains on the Phoenix line, do you?

A. There are through freight trains operated through there, yes.

Q. I mean as a usual practice, the greater percentage of your through freight trains go through Maricopa?

A. That is right.

Q. And your freight trains which are operated on the Phoenix line are mostly what you might call "gathering trains"?

A. Yes, there is more gathering service on the Phoenix line than on the freight main.

Q. In a great many ways it is operated much like a branch line, I mean freight service not passenger service?

A. It has less traffic, I will say, than our freight main; but it is equipped for through freight service and there is through freight service operated on that line.

Q. But your trains which are operated there are lighter and shorter trains?

A. That is right.

Q. And that would have its effect upon the cost, upon [fol. 3044] the operation as a whole on the Tucson division?

A. Yes, it would.

Q. Mr. Herbert, referring to form 521 for the year 1937, the total helper service, main and branch, on the Salt Lake division, locomotive-miles, was 107,757 locomotive-miles, is that correct?

A. That is correct.

Q. On the Tucson division that item was 207,574 locomotive-miles, is that correct?

A. Yes, that is correct.

Q. The car-miles, main and branch loads, Salt Lake, 118,691,150?

A. That is correct.

Q. Empties, 67,847,451?

A. Yes, sir.

Q. That is car-miles, a total of 186,538,601?

A. Yes.

Q. And on the Tucson division, loads, 85,648,095?

A. Yes.

Q. Empties, 53,000,379?

A. Yes.

Q. Total loads and empties, 138,648,474?

A. That is right.

[fol. 3045] Q. Road switching, freight, total Salt Lake, main and branch, 102,648 locomotive-miles?

A. That is right.

Q. Tucson, 118,494?

A. That is right.

Q. Do you have the year 1938, Salt Lake helper locomotive-miles, 86,656?

A. 83,656.

Q. Tucson, 192,867?

A. No, that is for last year. 208,892.

Q. The car-miles, loads and empties, loads 101,080,199, Salt Lake?

A. That is right.

Q. Empties, 59,555,854?

A. That is right.

Q. Total, 160,636,053?

A. That is right.

Q. Tucson, 77,183,015?

A. That, again, is last year's, 83,598,395.

Q. What is the empties?

A. 55,914,520.

Q. And the total?

A. Loaded and empty, 139,569,915.

Q. Road switching?

A. I guess I am in error. I have the wrong year for [fol. 3046] Tucson. You gave the right figures for those.

Q. Will you call those again; Tucson division, loads?

A. 77,183,015.

Q. Empties, 50,201,472?

A. That is right.

Q. Total, 127,384,487?

A. That is right, and on the helper miles it would be 192,867.

Q. Road switching, Salt Lake division, for 1938, 69,288 locomotive-miles?

A. Yes, that is right.

Q. Tucson, 108,666?

A. That is right.

Q. 1939, helper, Salt Lake, 99,479 locomotive-miles?

A. That is right.

Q. Tucson, 208,892?

A. That is right.

Q. Car-miles, loads, Salt Lake, 115,547,105?

A. That is right.

Q. Empties, 67,087,547?

A. That is right.

Q. Total, 182,634,652?

A. That is right.

Q. Tucson, loads, 83,598,395?

[fol. 3047] A. That is right.

Q. Empties, 55,911,520?

A. That is right.

Q. Total, 139,509,915?

A. That is right.

Q. Road switching, Salt Lake, 65,298 locomotive-miles?

A. That is right.

Q. Tucson, 121,902 locomotive-miles?

A. That is right.

Q. Now availability of materials and supplies, of course that would affect costs to some extent?

A. Availability of supplies?

Q. For example, your water costs for locomotives differ on the two divisions?

A. Yes, they will differ slightly.

Q. That will affect your costs?

A. It does not affect this cost as shown on these exhibits however, as that particular account is not included in these direct costs as shown on the 521.

Q. It is not a locomotive supply?

A. It is, but it is not one of the selected costs as selected on this 521.

Q. It is not one of the costs selected as a train cost, is that what you mean, in the form 521?

[fol. 3048] A. No, sir.

Q. It is a train cost, however?

A. Yes, sir, it is.

Q. I notice on exhibit No. 177, taking the year 1937 for example, you have on the Tucson division cost, September and October, the cars per train as identical but your costs varied approximately three cents?

A. Yes, that is true.

Q. So that costs would vary even though your train lengths didn't vary?

A. There are, as I stated before, various factors that affect costs but here I was attempting and I believe I did show the trend lines of cost rather than trying to depict any particular variation from one month to another.

Q. On referring to these exhibits, 177, 178, and 179, you have stated car loadings would affect the cost?

A. Yes.

Q. And if my calculation is correct, Mr. Masson's exhibits 163 and 164, the tons per car on the Tucson division for the year 1939 was 12.4 tons, Salt Lake, 13.8 tons; 1938 on the Tucson division, 12.28, and on the Salt Lake, 13.48, which would show there was at least a ton more per car [fol. 3049] being loaded on the Salt Lake division than on the Tucson division, isn't that true?

A. If that calculation is correct, that would be true.

Q. I wouldn't guarantee my calculations but I am using to get that figure, line 3 of exhibit No. 163, which shows on the Tucson division, 1939, average freight cars per train, 56.7, and net tons per freight train, 702. If line 3 were divided into line 4, that would give the tons per car, wouldn't it?

The Court: Mr. Reporter, when the witness finds the exhibit, will you read back Mr. Strouss' question, please?

(The last question was read by the reporter.)

The Witness: What year, may I ask?

Mr. Strouss: I was using the year 1939.

The Court: The principle, of course, would be the same in every year.

Mr. Strouss: Yes.

The Witness: Yes.

Mr. Strouss:

Q. And the same would be true, dividing line 3 into line 4 on exhibit No. 164 would give you the net tons per car on the Salt Lake division in each of those years?

A. Yes, sir.

[fol. 3050] Mr. Mason: That is assuming that these are freight cars per freight train, exclusive of caboose here.

Mr. Strouss: It is your exhibit.

Mr. Mason: I know, and the record should show whether they are inclusive or exclusive of caboose. The record doesn't show.

The Court: Well, we won't quibble over the caboose at this hour.

Mr. Strouss: Now, exhibit No. 181 is main line only?

A. Yes.

Q. But main line on the Tucson division of course does include the Phoenix line?

A. Yes, it does.

Q. And would be affected by the lighter volume of traffic and shorter trains on that division or on that branch?

A. It would be influenced by the traffic on that line.

Q. Now, this exhibit No. 200, grade crossings in Arizona, and exhibit No. 201, grade crossings in Nevada, you don't have those in such form as to show the location of the crossings with relation to the line itself?

A. No, I do not.

[fol. 3051] Q. Were you a witness in the Nevada case?

A. No, I was not.

Mr. Strouss: It is my recollection that is was presented that way there. I think that is all.

The Court: Any further redirect?

Mr. Mason: Well, I am not certain. In view of the lateness of the hour, I would like to reserve the privilege of recalling the witness.

The Court: The court will stand at recess until January 28th at ten A.M.

(Thereupon the court stood at recess until January 28th, 1941, at ten o'clock A.M.)

[fol. 3052] January 28, 1941, ten o'clock A. M.

All parties being represented as heretofore noted, proceedings were resumed at this time as follows:

W. W. Judson was recalled to the stand, and testified further as follows:

Cross-examination.

By Mr. Strouss:

Q. Mr. Judson, on your Exhibit 207, I notice that there are points, Livingston to Logan, and then Livingston to Bozeman, Livingston to Bozeman is an intermediate point between Livingston and Logan?

A. Yes, sir.

Q. There has not been any duplication, that is, trains haven't been counted twice by reason of using intermediate terminals there?

A. Well, I don't see the Livingston to Bozeman one that you mention.

Q. Bozeman to Logan.

A. No, there is no duplication in there.

Q. Now, I notice in your average consist that your loads are mostly other than perishables. What commodities [fol. 3053] made up those loads mostly there, do you know?

A. You meant other than perishables?

Q. Other than perishables. It would be under column B of average consist.

A. Well, I wouldn't know what these particular loads were.

Q. At that time of the year, is there any particular commodity which you carry on your lines?

A. Well, there would be some wheat moving at that time of year, lumber.

Q. Coal?

A. Coal.

Q. Would you take coal over these two districts that you have used here?

A. Yes, sir, company coal, principally company coal.

Q. What about ore, would there be any ore moving at that time over those districts?

A. As far as Missoula to Helena, very little east of Helena and Butte because the ore out of the Wallace district moves into Helena and Butte, which would show on this exhibit as far as Helena.

Q. How many through trains do you have scheduled over this territory?

A. One in each direction. That is, scheduled.

Q. Yes. You refer in your testimony to alternate line [fol. 3054] operations, page 2997, what do you mean by that term, Mr. Judson?

A. I can explain that on the map, I believe. Between Bozeman and Logan there are two lines of railway. One is used as a passenger line and a westward freight line, and the other is used as an eastward freight line, Logan to Bozeman. They are separate lines of railway.

Q. And the term of "alternate line operations," just refers to that district?

A. Well, there are others. Between Logan and Garrison are alternate lines, one via Helena and one by Butte, but the Butte line doesn't enter into the exhibit, because it is not the through freight line. Through freight operates by way of Helena.

Q. Will you just refer to the exhibit and tell me which of the districts shown in columns A and B are double track. Dickinson to Glendive?

A. Single track.

Q. Livingston to Logan?

A. Double track from Livingston to Butte and alternate line from Butte to Logan, I mean Livingston to Bozeman double track, and alternate line Bozeman to Logan.

Q. Now, Logan to Helena?

[fol. 3055] A. Single track.

Q. Helena to Missoula?

A. It is double track out of Helena for about twelve miles, then single track to Garrison and double track Garrison to Missoula, which is about 68 miles.

Q. It is double track, Garrison to Missoula?

A. Yes.

Q. Now, in operating your trains, do you operate as much as you can so as to use your double track for passing?

A. Well, I don't know as I understand your question.

Q. Well, to try to get your trains so that when they pass, they are passing on double track, I mean meeting and passing on double track rather than on single track.

A. Well, it very often happens that they meet on double track and we do call trains at the terminals, so that that can be done if it is convenient, but it is not an iron-clad rule of any kind.

Q. Your double-tracking was not spaced with that idea in mind?

A. The double-tracking in this particular territory, you will notice, from Missoula to Garrison is double-tracked and Garrison is the junction of the two lines. That gives us. [fol. 3056] a double track up to the junction point and then on the other end of the alternate line at Logan it is double-tracked and has an alternate line into Livingston and that permits of a free flow of traffic via either line with double tracks on each end.

Mr. Strouss. That is all.

Mr. Mason: No further questions.

The Court: May this witness with his records be excused?

Mr. Strouss: Yes.

The Court: It is so ordered.

Mr. Mason: Do you have some further cross-examination of Mr. Herbert?

Mr. Strouss: Yes, I have some other questions.

[fol. 3057] W. P. Herbert was recalled as a witness for further

Cross-examination.

By Mr. Strouss:

Q. Mr. Herbert, on your exhibits Nos. 178 and 180 I notice that there appears to have been a dip downward in cars per train, gross ton-miles per train, and car-miles per mile of road in the years 1925, 1926, and 1927. That

was the period immediately following the acquisition of the Arizona Eastern, was it not?

A. Yes, it was.

Q. When the operation over the so-called "Phoenix line" began?

A. Yes, that is true.

Q. Wouldn't the amount of bridge traffic have some effect on costs?

A. What way do you mean bridge traffic?

Q. If the percentage of bridge traffic on one division were greater than as compared with another division, wouldn't that have some effect upon the costs? Can't bridge traffic be handled at a lesser cost than traffic which is picked up on the division so far as division costs are concerned?

A. Ordinarily I would say "Yes."

[fol. 3058] The Court: Mr. Strouss, what do you mean by "bridge traffic"?

The Witness: Bridge traffic is traffic that originates on another division and is bridged over, for instance, the Tucson or Salt Lake division, and then terminates on some other division.

The Court: Non-revenue company traffic?

Mr. Strouss: No, it is revenue traffic. Isn't that correct, revenue traffic which originates on another division and simply passes over that particular division as a bridge to carry through?

A. Yes, that would be more economically handled than traffic originating on the division.

Mr. Mason: I think we should understand the term, "bridge traffic," as having nothing to do with the revenue or non-revenue characteristics. The term, "bridge traffic," simply applies to traffic which originates outside the territory considered and is delivered outside the territory considered.

Mr. Strouss: That is true.

The Court: I wanted to be certain I got the meaning of your term.

Mr. Strouss:

Q. The Court asked you concerning double tracking in Arizona and Nevada. The only double tracking in Arizona

[fol. 3059] is a few miles between Yuma and Wellton and then some just out of Tucson?

A. Tucson to Mescal.

Q. Those two places are the only double tracking in Arizona?

A. The only two that are strictly termed double track. However, we have two lines in Arizona, as you can see by the map, exhibit No. 1.

Q. As I understood the testimony, however, your through freight, very little of it is carried over the Phoenix line?

A. That is right.

Q. In Nevada there is double tracking from the state line to Sparks?

A. Yes.

Q. And from Perth to Rose Creek?

A. Yes, I believe that is correct.

Q. Then you have the paired track operations from Weso to Alazon?

A. Yes.

Q. The operation there is similar to a double-track operation, isn't it?

A. Yes.

Q. Then you have what additional double tracking in Nevada?

A. We have double tracking from Cobre to Teconna and [fol. 3060] some across the Great Salt Lake, it doesn't show on this exhibit the exact stations.

Mr. Mason: I think the Great Salt Lake is all in Utah.

A. That is right. There is a small part east of Wells, possibly about ten miles.

Mr. Strouss:

Q. In your testimony you testified and in your charts you show the trend of costs on the two divisions, costs as shown including both main-line and branch-line operation?

A. Yes.

Q. From your form 522 which prior to 1931 showed or segregated both main-line and branch-line costs, I have taken the main-line costs, on the two divisions which I would like to read to you and ask you to check them to see if these are correct. I think you can check them afterwards, it may take a little time.

A. All right.

Q. Salt Lake, main line, .877.

Mr. Mason: What year is this?

Mr. Strouss: 1920.

Mr. Mason: What is the cost? Per what?

Mr. Strouss: It would be 8.77 for that year per hundred gross ton-miles; 1921, per thousand gross ton-miles, still [fol. 3061] Salt Lake, .814; 1922, .735; 1923, .606; 1924, .596; 1925, .48; 1926, .38; 1927, .37; 1928, .359; 1929, .384. Tucson division, 1920, per hundred gross ton-miles, 9.90; 1921, shown at per thousand gross ton-miles, .90; 1922, 746; 1923, .661; 1924, .676; 1925, .582; 1926, .50; 1927, .454; 1928, .468; 1929, .466. That is all the questions I have.

[fol. 3062] Redirect examination.

By Mr. Mason:

Q. Mr. Herbert, you were asked to confirm for the record certain statistics of helper locomotive miles for the Tucson and Salt Lake Divisions for the years 1937, 1938, and 1939. Now, I will ask you if by reference to the Forms 521 for the two divisions for the two years you have computed the percentage ratio of the helper-miles on each division to the total locomotive-miles on each division for each of those years?

A. Yes, I have.

Q. And will you state for 1937 the ratio of helper-miles to total locomotive-miles for the Tucson division?

A. For the Tucson division, 6.6 per cent.

Q. For 1938?

A. 7.1 per cent.

Q. For 1939?

A. 6.9 per cent.

Q. Now, for the Salt Lake Division for 1937, what is the ratio of helper-miles to total locomotive miles?

A. 3.6 per cent.

Q. For 1938?

A. 3.5 per cent.

[fol. 3063] Q. For 1939?

A. 3.7 per cent.

Q. You were also asked, in this connection, to verify the road-switching-miles of freight service performed on the two divisions. Have you computed the ratio of road-

switching-miles to total miles for locomotives for the two years?

A. Yes, sir.

Q. What is the figure for the Tucson division for 1937?

A. 3.6 per cent.

Q. For 1938?

A. 3.9 per cent.

Q. For 1939?

A. 3.9 per cent.

Q. What are the corresponding figures for the Salt Lake Division for those three years?

A. 1937, 3.3 per cent; 1938, 2.8 per cent; 1939, 2.4 per cent.

Q. Those represent the ratio of the road-switching-miles to the total of locomotive-miles reported on 521?

A. Yes, but, I might add, in order to get the total averages computation, I added the road-switching-locomotive-miles to the total.

Q. So that the total which you have used as a basis for [fol. 3064] the ratio represents the locomotive-miles in freight service plus the road-switching-miles.

A. Yes, sir.

Q. And the total locomotive-miles themselves are applied as the divisor in obtaining that ratio?

A. Yes, sir.

Q. Now, it was also suggested in your cross-examination that the availability of traffic or its non-availability, rather, and the presumed consequent effect upon locomotive loading would have some effect on cost. I will ask you if the total of the car-miles made on a division as reported after they are made on the Form 521 in any way indicates the amount of traffic on hand to be moved?

A. No, it doesn't.

Q. What does it indicate as to the amount of traffic?

A. It indicates in a general way the amount of business moved.

Q. Does it indicate the amount that was moved?

A. The amount of cars that were moved, it would indicate that in some way, but it doesn't indicate, for instance, the amount of cars that could be moved in any one train. [fol. 3065] Q. Does the total of car-miles, as shown on 521, in any way reflect the train lengths?

A. No, it doesn't.

Q. Now, again, it was suggested in your cross-examination,——

The Witness: (Interrupting) I might make something else clear there, that even though Arizona might have fewer car-miles than Nevada, it is the aggregate over a year, it doesn't necessarily show or say that we could not, if the law were unrestricted, handle the same number of cars per train as handled in Nevada.

Q. It doesn't indicate one way or the other as to that?

A. No, it doesn't.

Q. As a matter of fact, the showing of car-miles on 521 is a history of past performance and not a showing of prospects, is that right?

A. That is correct.

Q. It was suggested in your cross-examination that the loads per car as between loading to capacity and loading at half capacity might have some effect on the gross ton-mile cost. I will ask you if the car loadings can have any effect on the cost per gross ton-mile for moving the [fol. 3066] car, or whether that effect would be solely on the cost per net ton-mile?

A. It would be practically all on the net ton-mile costs, except to a slight extent in Arizona, because of the restriction in train lengths.

Q. You were asked to verify certain figures as to total car-miles and empty car-miles for each year on the two divisions. By each year, I mean each of the three years 1937, 1938, and 1939. I will ask you if you have computed for each division for each of those years the ratio of the empty car-miles to the total car-miles made?

A. Yes, sir, I have.

Q. What is the ratio of empty car-miles to total car-miles made on the Tucson division for 1937?

A. 38.2.

Q. In per cent?

A. Per cent.

Q. And for 1938?

A. 39.4 per cent.

Q. 1939?

A. 40.1 per cent.

Q. Now, for the Salt Lake Division for 1937, what was the ratio?

A. 36.4 per cent.

[fol. 3067] Q. For the year 1938?

A. 37.1 per cent.

Q. And for 1939?

A. 36.7 per cent.

Q. It was suggested during the course of your cross-examination, pages 3036 to 3050, that the lighter density of traffic on the Phoenix Main Line might have some influence upon the unit cost upon the Tucson Division. Now, I will ask you if there is on the Salt Lake Division, and as part of that Salt Lake Division, a line classed as main line which is likewise of lighter traffic density than the principal main line?

A. Yes, the line from Alturas to Fernley is a line of light density traffic.

Q. What is the length of the line from Alturas to Fernley?

A. Approximately 180 miles on the Salt Lake Division.

Q. That line is all a part of the Salt Lake Division from Alturas to Fernley?

A. Yes.

Q. And since 1929 has entered into the cost, main line costs, for the Salt Lake Division?

A. That is right.

Q. I think it was suggested in your testimony, though [fol. 3068] I haven't the precise transcript reference, that the cost of water for train locomotives was not included in the costs entering into the computations on your exhibit 177 and following. I recall some testimony on that point. Will you say whether the cost for water for train locomotives is or isn't included in the figures leading to the cost of per thousand gross-ton-miles as shown on your exhibit?

A. Yes, I made a check on that, and I find it is included in the 521.

Q. What general subdivision and in what particular accounts?

A. The accounting department has grouped three accounts there included in "Other Locomotive Supplies," 397, water for train locomotive, 398, lubricants for train locomtive, and 399, other supplies for train locomotives.

Q. They are called collectively what?

A. Other Locomotive supplies.

Q. This morning you were asked as to the extent of double track on the Tucson and Salt Lake divisions. Do you know, Mr. Herbert, and if so will you state whether the preponderance of passenger traffic on the Tucson division passes over the Phoenix line or Gila line?

[fol. 3069] A. Over the Phoenix line.

Q. Do you know what the daily separation is as to passenger traffic over the two lines?

A. I believe there is one train in each direction a day over the Gila line.

Q. What does that mean over the Phoenix line?

A. Three regular passenger trains a day on the Phoenix line in each direction.

Q. Or six altogether in both directions?

A. There are four altogether. When I said one in each direction, I meant one train. It might be one train of one number in one direction, and one train of another number in the other direction on the Gila line.

Q. In any event, of the four regularly scheduled passenger trains between Yuma and Tucson, in each direction, three are regularly scheduled over the Phoenix line and one only over the Gila line; is that correct?

A. Yes, except No. 30 and 29, which now operates on every odd day, I believe it is, which is the new Arizona Limited, operates between Tucson and Phoenix in addition to those other regularly scheduled passenger trains mentioned.

Q. That is half a train a day each way, from Tucson to Phoenix?

[fol. 3070] A. Yes, sir.

Q. Then there are each way three-and-a-half trains daily on the Phoenix line, and only one on the Gila line?

A. That is right.

Q. I will ask you whether this separation of the passenger traffic over the Phoenix line, and the freight traffic over the Gila line, except for the Phoenix service, is a help or a hindrance as to the matter of interference as to freight and passenger train operation?

A. It is a help to the main freight line to have the passenger trains out of the way, because there is less interference. Passenger trains having the right-of-way in most cases over freight trains, naturally causes the freight trains to be set aside for them at meets.

Mr. Mason: That is all. I expect to recall Mr. Herbert later for additional testimony that has not yet been developed.

Recross-examination.

By Mr. Strouss:

Q. You say that in calculating the percentage of road switching you added the road switching in each division [fol. 3071] to get the total. Did you do that also in determining the ratio of helper-miles?

A. Well, in helper-miles the total included the helper-miles on the 521, and I didn't have to do that.

Q. In the helper-miles, did you also consider the helper-locomotive, the miles light returning after it had been cut out of the train?

A. No, I just showed the helper-miles as shown on the form 521, and as picked out by you in my cross-examination.

Q. Now, you referred to the Alturas-Fernley main line. Of course, the effect of the main line having trains of lighter traffic would have upon the balance of the main line would vary according to the amount of traffic there might be on a particular light traffic section, wouldn't it?

A. Yes; it is merely pointed out here to show that Salt Lake division does have a main line with light traffic on it.

Q. It is true that the traffic on the Phoenix line is of considerably greater density than that on the Fernley-Alturas line?

A. I couldn't say as to that off-hand, whether it would be considerably or not.

Mr. Strouss: That is all.

(Witness excused.)

[fol. 3072] Walter Bohnstengel was called as a witness on behalf of the defendant and, being first duly sworn, testified as follows:

Direct examination.

By Mr. Mason:

Q. State your name and residence.

A. Walter Bohnstengel, Topeka, Kansas.

Q. Are you employed by a railroad company?

A. I am.

Q. Which company?

A. The Atcheson, Topeka and Santa Fe Railway.

Q. In what capacity?

A. As engineer of tests.

Q. How long have you been employed by the Santa Fe?

A. The first in 1906-1907, at Dodge City, in the roundhouse, and since January 1, 1912, in the test department at Topeka, Kansas.

Q. Your experience, then, is 28 years continuous, plus some prior experience?

A. Isn't that 29 years?

Q. 29 years, that is correct. Is that right, 29 years continuous?

A. Yes, sir.

Q. Do you hold any engineering or scientific degrees, [fol. 3073] Mr. Bohnstengel?

A. I do.

Q. Will you state what they are?

A. Bachelor of science in mechanical engineering, University of Kansas, 1910, and mechanical engineer from the University of Kansas, 1920.

Q. You have been engineer of tests for how long?

A. Since July first, 1940.

Q. And prior to July 1, 1940, what was your position with the Santa Fe.

A. Beginning January, 1912, I was test department assistant, later laboratory foreman and assistant to engineer of tests, then assistant engineer of tests from about 1917 or 1918, and engineer of tests; on promotion of Mr. Chapman, the then engineer of tests, to Chicago, I was appointed engineer of tests at Topeka.

Q. Have you assisted or supervised tests of railroad equipment during your employment by the Santa Fe?

A. I have, sir.

Q. For how long?

A. Most of the time that I have been in the test department, I have done individual work to a good extent, but [fol. 3074] also supervised the work of others in that line.

Q. Do you belong to any technical associations or societies having to do with your work as engineer of tests?

A. I do.

Q. Will you name some of these societies to which you belong?

A. I belong to the American Society of Mechanical Engineers as a member, American Society for Testing Materials, the American Railway Engineering Association, and the Association of American Railroads.

Q. Any particular section of the latter?

A. The mechanical section of the latter.

Q. Will you list some of the types of railroad equipment or material which you have tested or assisted in testing?

A. It has to do with materials such as—my earliest work in the test department was in connection with steel, rails, ties, ballast, then car and locomotive equipment, operation and functioning of ventilators and ventilating cars, locomotive tests about 1914 between Chicago and Chillicothe, and later Chillicothe to Shopton, Iowa.

Q. Have you tested such parts of equipment as wheels?

[fol. 3075] A. I have, yes, sir.

Q. Tires?

A. Yes, sir.

Q. Axles?

A. Yes, sir.

Q. And fixed material such as bridge timbers?

A. Yes, sir.

Q. Track material?

A. Yes, sir.

Q. Ties?

A. Ties, joint bars or angle bars as they are called, track bolts, rails.

Q. Have you ever ridden on railroad trains or cars for the purposes of these tests?

A. Not particularly the material tests, but the check of riding and equipment such as locomotives, cars, and action of these in service.

[fol. 3076] Q. Have you ridden on locomotives for the purpose of testing equipment?

A. Yes, sir.

Q. Can you state the approximate number of miles that you have ridden for the purpose of tests or verification of tests?

A. For tests including going to and from work, checking riding equipment with and without instruments, say from 35 to 75 thousand miles a year. I think 75 is the high. Last year in line of duty it was a little under 50,000.

Q. Have you made any tests of locomotives in actual service in the handling of trains?

A. Yes, sir, particularly power performance and tonnage performance.

Q. Have you ever ridden on freight trains for the purpose of making tests of equipment other than locomotives?

A. Yes, sir, in connection with riding qualities of locomotives and cars, snubbers and spring action, and the longitudinal action, such as occurs in connections between equipment cars, as draft gears, etc.

Q. Have you ridden on freight trains of various lengths for this purpose?

A. Yes, sir.

[fol. 3077] Q. What lengths?

A. Possibly from fifty to one hundred cars or over.

Q. On what railroad lines were those trains being operated?

A. Mostly Santa Fe.

Q. Have you ridden on trains on other railroads as well?

A. For that purpose, no, but in connection with tonnage tests on the Frisco when I was accompanying our dynamometer car about 1917 or 1918, December of 1917 and January of 1918 as I recall.

Q. Have you ridden over the Santa Fe pretty generally in making your test observations?

A. Yes, particularly the main lines.

Q. What part of the freight trains have you ridden, that is, the head or rear of where?

A. The last freight train I was on was a 106-car train from Emporia to Argentine. That was on September 23rd, as I recall it, because I had a little difficulty getting on.

Q. 1940?

A. Yes.

Q. On what part of the train did you ride?

A. I rode in the business car just ahead of the way car which was on there on account of the 11-car fruit shipment [fol. 3078] from California to Chicago and I was checking the riding action.

Q. When you speak of the way car, do you mean the car usually called the caboose?

A. The way car or caboose as we term it.

Q. Have you ridden generally at the rear end or near the rear end of freight trains?

A. I have on occasions where I wished to observe the action.

Q. What is your purpose in riding at the rear end of these freight trains?

A. Just to observe the performance and action where train handling was involved.

Q. In the course of the testimony here, reference has been made from time to time to a particular appliance or device attached to freight cars known as the draft gear. Are you familiar with that portion of the freight car?

A. I am.

Q. Have you ever made studies or tests relating to draft gears?

A. Yes, sir, rather extensive tests.

Q. Will you please state in general what is the purpose and function of the draft gear?

A. The draft gear at the tender of a locomotive and at both ends of cars is placed there with the idea of providing [fol. 3079] a flexible cushioning connection between the various units of your train to protect against shocks and make a yielding energy-controlled unit between the cars of the train.

Q. Is the draft gear connected to the coupler?

A. Yes, sir.

Q. Does the draft gear serve any purpose in absorbing shocks?

A. It does.

Q. Does it serve any purpose in the starting of the trains?

A. It does, in that it provides a flexible means that you don't have to start your entire train at once, you start it in increments.

Q. You start it one car at a time, so to speak?

A. Essentially that, taking slack in your train to start a little at a time and get your whole train rolling, which runs easier after rolling than the initial start.

Q. Are you a member of any committee or committees of railroad employees or officers having to do with the determination or maintenance of standards for draft gears?

A. I am.

Q. Will you state the name of that committee?

A. I am a member of a coupler and draft gear committee [fol. 3080] of the Association of American Railways and also a member of the subcommittee on draft gears of that same association.

Q. What is the nature of your work in that particular connection?

A. The idea is to supervise tests of draft gears for certificates of approval and check draft gears from time to time as one of the functions of the American Railway Association to see that they are maintained according to specifications.

Q. Did you study merely the experimental types of draft gears as invented from time to time or those which are supplied for application to freight cars?

A. The Association through its committee members studies the perfected models of draft gears rather than the experimental.

Q. When you say the Association, you mean that you yourself do that?

A. As a member of the committee and sub-committee.

Q. Then your work is not so much the purpose of development as to test what someone else has developed?

A. To see that it is suitable for the purpose intended.

[fol. 3081] Q. Have you participated in any tests of draft gears?

A. I have, yes, sir.

Q. Do those include laboratory tests?

A. Laboratory and car impact which may be considered laboratory also.

Q. Do they include as well field tests or reviews of performance in actual service?

A. They do to a limited extent.

Q. Will you state just what is done in these laboratory tests, I mean very briefly, what sort of implement you use in testing a draft gear?

A. That is rather a large subject and is a little difficult.

Q. Do you have a method of testing a draft gear in the laboratory by means of a heavy hammer?

A. Two methods are used, one is termed "static loading" under a testing machine where you can apply 400, 600 thousand pounds to close the draft gear. The other is the dynamic test which is under the hammer. We have in the Association laboratory equipment really three hammers, one is a two thousand pound or 2,240 pound hammer which is used on axles and rail; then a 9,000 pound hammer, I am referring to the falling weight, a 9,000 pound hammer that was used up to about 1928 or 1929 for the test of [fol. 3082] draft gears and now the 27,000 pound ham-

mer that has become standard for that same purpose. The reason, I believe, may be evident, the 2,000 pound hammer would have to drop considerably further and strike at a much higher relative velocity than the 9,000, so years ago, before the war, before 1918 a 9,000 pound hammer was used which of course limited the drop to quite an extent and then in order to get down to the mass comparable with the weight of a car the still heavier hammer was decided upon, which was built for use at Purdue University, the American Railway Association laboratories, where it is now serving its purpose to test dynamically draft gears, spring nests, spring snubbers, and equipment that is subject to a shock or quick action. The slow testing machines like the Riehle or Olsen or Emery Tatnall are still used for slow loading to get your curve or performance under a slower load.

Q. When you speak of slow loading machines, is that a means of applying continuous pressure by hydraulic or other means?

A. Hydraulic or screw means.

Q. Rather than the sudden application of pressure such as developed by the drop of the hammer?

[fol. 3083] A. The hammer develops its force by gravity. The tests are started by raising the hammer just in contact with the draft gear and tripping it just letting the weight drop upon the draft gear. Then it is raised half an inch, then an inch, then an inch and a half, small increments to determine the behavior under successively increased dynamic load upon the draft gear.

Q. I take it that the dynamic load, as you speak of it, increases with the height of the drop?

A. It does.

Q. And you can obtain in the same way an increasing slow load by increasing the pressure with the slow loading machine?

A. You can; while they are comparable they are not always identical.

Q. You spoke also of car impact. Is that a particular method of test?

A. That is a method that was developed by the U. S. R. A., United States Railway Administration.

Q. You have participated in such car-impact tests, have you?

A. I have, yes sir.

Q. How is the car-impact test undertaken?

A. The ends of two cars are equipped, the buffing ends are equipped with a draft gear that is desired to be tested. [fol. 3084] One car is stationary, the other car is pulled up an incline of known percentage of grade and tripped at a certain point which will give it a certain impact speed of, say, one mile, one and a half miles, two miles per hour successively higher, the intent of it being to determine at what car impact a draft gear will go solid, close entirely.

Q. Is the car which is hauled up the incline allowed to roll down the incline and strike against the other car?

A. It is allowed to go down the incline to get its speed and then travels on level track so that it is supposed to be at a constant speed and impacts on level track, and a chronograph is used, if I recall my setup rightly, about a 30-inch movement that is rotated at a constant speed from which you can measure the fraction of a second or the number of seconds that it takes for one draft gear to close and for the mate to close and for the two to open. You can from that plot each car as it does its own drawing, it is not done manually, it has to be adjusted of course by operators but it gives you a diagram or picture or how one car slows down and the other car speeds up.

Q. And the reaction of the draft gear to the impact?

[fol. 3085] A. That is the intent of it.

Q. You spoke of the Association of American Railroads' laboratory. Is that at Purdue University?

A. That is at Purdue University.

Q. Have you participated in tests at other laboratories?

A. I have, yes, sir.

Q. Do the manufacturers of draft gears maintain laboratories for the testing of their products?

A. They do.

Q. Have you tested draft gears at the manufacturers' laboratories as well as at Purdue?

A. I have at several different ones.

The Court: We will take our morning recess at this time.

(Thereupon a short recess was taken, after which proceedings were resumed as follows.)

The Court: You may proceed.

Mr. Mason:

Q. Mr. Bohnstengel, you spoke of this laboratory at Purdue as being the Association laboratory. Do I under-

stand that the Association of American Railroads built and equipped that laboratory?

A. They did, yes, sir.

[fol. 3086] Q. Is it open to the use of the university and the university students in the mechanical department there?

A. It is rather a commercial laboratory where manufacturers pay to get their various devices or equipment that needs such tests subjected to official tests. The students can visit there and examine it, but they do not use it for student work.

Q. They use it more for the purpose of observation I take it?

A. If they come at all yes, sir.

Q. I take it that you test other things than draft gears there?

A. It is built primarily as a draft-gear laboratory but they do test spring snubbers and car springs.

Q. What is the purpose of these various tests you have described as employed in connection with draft gears?

A. Should I elaborate a little on that? Go back into the development from 1918?

Q. I intend to ask you about that later. Do you use these tests to determine whether draft gears in commercial service or proposed for commercial service meet certain specifications?

[fol. 3087] A. That is the intent of the tests, to see that they meet the American Railway Association specifications.

Q. Those specifications have to do with the strength and resistance to shock or stress, do they, as well as the size and character of material?

A. Durability and so forth of the equipment.

Q. You spoke of the drop test or the hammer test. Is that comparable to the action of a pile driver hitting on top of a pile?

A. Very much. The pile driver, however, some of them add steam pressure to the gravity action of their hammer while this depends entirely on gravity and is a fixed quantity for any one location.

Q. You spoke of the 27,000-pound hammer as in use there. What drop with a 27,000-pound hammer is the maximum that you use in connection with the present standard types of draft gear?

A. A draft gear to meet specifications must at least withstand 18,000 foot-pounds of energy, which would be the weight, 27,000-pound weight, divided into that many foot-pounds or inch-pounds which, I believe, gives you a figure of approximately six inches.

Q. You spoke of the minimum being 18,000 foot-pounds [fol. 3088] of energy applied at the end of the draft gear?

A. At the end of the draft gear.

Q. What is 18,000 foot-pounds of energy equivalent to in pounds per square inch?

A. Not in pounds per square inch, it would be total load.

Q. Well, total load?

A. Total load on the draft gear would be equivalent from three to five hundred thousand pounds.

Q. You spoke of a car-impact test. Do you use a loaded car for that test?

A. Fully loaded car, 70-ton car as I recall was used in our work; that would be 210,000 pounds on rail.

Q. What type of car would that be?

A. They were gondola cars loaded with iron pigs or pig iron, whichever way you want to word it.

Q. Is the car impact test in any respect similar to the actual movement of cars against each other in switching operations or shunting?

A. It would be very similar to hump-yard switching and comparable to picking cars and letting them couple into each other.

Q. You speak of hump-yard switching. You mean where [fol. 3089] cars are moved to different tracks in the yard by means of gravity?

A. Yes, sir.

Q. We have been discussing the draft gear. I want to ask you if there is any distinction between the draft gear and the appliance sometimes called the "drawbar"?

A. Those two terms are used interchangeably to a certain extent.

Q. Are they properly interchangeable or are they really distinct?

A. That would be difficult to answer.

Q. Will you state what the drawbar is usually thought of as consisting?

A. The drawbar or the draft rigging usually consists of the items, coupler, follower plates, knuckle, yoke, and draft gear.

Q. Then the draft rigging is the proper term for the entire assembly of drawbar and draft gear, is it?

A. I think that is more inclusive than to say the coupler or one of the items.

Q. The coupler and the draft gear are two separate things, aren't they?

A. The coupler and drawbar are used more or less [fol. 3090] interchangeably but never include the draft gear.

Q. What is the draft gear itself as distinguished from the drawbar? Is that merely the mechanism to which the drawbar is attached?

A. It is the flexible mechanism in the draft gear proper.

Q. Have you an exhibit in the form of a series of three drawings which will show the draft gear, drawbar, coupler, and so forth?

A. Yes, sir.

Q. The exhibit is in one sheet with three different drawings on it entitled, "Comparative Position of Couplers under Maximum Draft Gear Travel, Normal Buff and Pull." Have you that drawing before you?

A. Yes, sir.

Q. Was this prepared at your direction?

A. Yes, sir.

Q. Have you reviewed the drawing?

A. I have, yes, sir.

Q. I understand that it represents a particular type of draft gear, according to its title, known as the "National M-17" and "M-17-A" draft gear?

A. It does, yes, sir.

Mr. Mason: May this be marked as defendant's exhibit [fol. 3091] next in order?

The Court: It may be marked.

The Clerk: Defendant's exhibit No. 210 for identification.

Mr. Mason:

Q. Are you familiar with National M-17-A and National M-17 draft gear?

A. I am, yes, sir.

Q. Have you seen that draft gear both in actual use as well as represented by model?

A. I have.

Q. Have you made studies of the drawings representing the draft gear?

A. Yes, sir.

Q. And of the draft gear itself?

A. I have.

Q. Have you compared the drawings before you with the draft gear or drawings of that draft gear to determine whether it is correct?

A. It is essentially correct.

Q. Do these drawings represent the National M-17-A draft gear with certain attachments in various positions as indicated?

A. It does.

Q. Are the dimensions and the names of the various parts correctly shown?

A. They are.

[fol. 3092] Q. Are you also familiar with the model which is on the table before you which bears at least in one place a statement that it is a model of the National M-17 draft gear?

A. It is, about a quarter-size.

Q. Does the model also represent in all essential features the National M-17-A draft gear?

A. It does.

Q. What is the approximate scale of the drawing as compared to the size of the National M-17-A draft gear?

A. It is just a little under one-sixth size. Four inches is equivalent here to twenty-four and five-eighths.

Q. This drawing illustrates only one particular type of draft gear, does it not?

A. It does, yes, sir.

Q. Do friction draft gears in general operate according to the same principles which are indicated by the drawings on exhibit No. 210 for identification?

A. The same basic principles, yes, sir.

Q. Is the National M-17 draft gear and the M-17-A draft gear now in use upon freight cars according to your own observation?

A. It is, yes, sir.

[fol. 3093] Q. How long has it been in use?

A. To my knowledge, since about 1925.

Q. Would this drawing illustrate the operation of other types of draft gears so far as essential dimensions and length of travel are concerned?

A. It would, yes, sir.

Q. Are the dimensions and lengths of travel as indicated by the exhibit in accordance with A. A. R. standards?

A. They are.

Mr. Mason: Have you any questions, Mr. Strouss?

Mr. Strouss: I was wondering what you meant, Mr. Bohnsteagel, when you said the drawing here is essentially correct, using the term "essentially"?

Mr. Mason: I don't think that was his answer.

A. I did say "essentially" but what I had in mind was that it is not detailed as to dimensions. It is to scale and is entirely correct in that respect, but not dimensioned in detail. That is the thought I had in mind.

Mr. Strouss: That is all.

Mr. Mason: We offer the exhibit in evidence as defendant's exhibit No. 210.

Mr. Strouss: No objection.

The Court: It may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 210.")

[fol. 3094] Q. Now, will you refer to exhibit No. 210, and particularly to the top drawing entitled "Normal Position." What is the relationship of the couplers to each other in the normal position?

A. The pulling and buffing faces are entirely free.

Q. When you speak of "buffing," do you mean pushing, equivalent to or for the purpose of pushing?

A. Yes, sir.

Q. And pulling, of course, is the opposite of buffing, I take it.

A. Yes, sir.

Q. I take it that the representation at the extreme left of the drawing indicates the coupler of an adjoining car?

A. It does.

Q. And then you have, commencing at that point, which is marked "coupler," an arrow showing the coupler of the car to which the draft gear is attached?

A. Yes, sir.

Q. In the first position you have the couplers in a condition where they are free of either buffing or pulling contacts?

A. Yes, sir, they are running free.

Q. In that position could the pin be lifted in either [fol. 3095] coupler?

A. Yes, sir.

Q. Without any change in the relative position of the cars?

A. Yes, sir.

Q. In what position is the draft gear in the first drawing, "normal position."

A. It fills the draft-gear pocket and the yoke and is not compressed beyond its own initial compression.

Q. Is the front end of the draft gear in contact with any particular part of the mechanism, and, if so, in what way?

A. The front end is in contact with the follower and the follower is in contact with the front end of the yoke and the butt end of the coupler.

Q. Now, is the back of the draft gear in contact with any particular portion of the draft rigging?

A. I should have added on that first question, the follower is in contact with the front draft lugs of the car, the rear end of the draft gear is in contact with the rear draft lugs of the car and with the rear end of the coupler yoke.

Q. And what is the relative positions of the coupler horn and the striking casting?

[fol. 3096] A. There is a space of three inches or over three inches in this drawing between the horn and the striking casting.

Q. When you refer to the coupler horn, just what part of the coupler do you mean?

A. That is a raised portion on the coupler bar that was put there in early car construction to contact the striking casting and help take the buff load on the car.

Q. What is the striking casting; is that a part of the end of the car?

A. That is part of the end sill or frame construction of the freight car.

Q. What does the striking casting consist of, is it wood or metal?

A. It is a steel beam or steel channel, often with a special casting on it to give added strength in the newer constructions.

Q. In normal operation, does the coupler horn ever contact the striking casting?

A. It is not intended to.

Q. What prevents the coupler horn from striking or contacting the striking casting?

A. The draft gear going solid on its own housing.

Mr. Mason: I wonder if counsel would object if we place [fol. 3097] the model before the Judge. It might be easier to follow.

Mr. Strouss: No, not at all.

Mr. Mason: In this normal position, is there any compression of the springs of the draft gear?

A. Only the intial compression of possibly a half inch or more, three-quarters of an inch, that the manufacturer builds into these draft gears to give initial compression resistance. It amounts to possibly five, ten or fifteen thousand pounds on the draft gear.

Q. There are certain friction members indicated by the drawing. Are the friction members in contact in the normal position?

A. They are; yes, sir.

Q. Going to the second drawing, or the center drawing called "Buff Position," what is the relative position of the couplers there?

A. The buffing faces are in contact, with seven-eighths of an inch of opening between the pulling faces; the draft gear is compressed its full travel, two and three-quarter inches, and fully contacts the buffing lugs on the car frame.

Q. Are those buffing lugs at the rear of the draft pocket?

A. They are; yes, sir.

[fol. 3098] Q. And known and identified in the upper drawing as the rear draft lug?

A. Yes, sir.

Q. And has the front end of the draft gear moved from the position indicated in the normal position drawing?

A. It has.

Q. In what direction, and for what distance?

A. Backward two and three-quarters inches.

Q. Has the coupler horn moved?

A. It has.

Q. The coupler horn of the car on which the draft gear under study is attached?

A. It has.

Q. Moved in which direction?

A. Also backward.

Q. How far?

A. Two and three-quarters inches, or within one-fourth inch of the line indicating the striking casting.

Q. Now, what is this seven-eighths of an inch of separation between the knuckles of the couplers called; what is that seven-eighths of an inch?

A. That is free-slack.

Q. What is this two and three-quarter inches of travel [fol. 3099] of the draft gear called?

A. That is controlled slack or controlled resistance.

Q. Is this two and three-quarter inches the maximum travel of the draft gear which can be obtained by maximum shock?

A. Except by deforming members beyond the designed travel.

Q. Well, without any deformity of the draft gear, is the two and three-quarters inches the total travel?

A. It is; that is the nominal travel.

Q. How much compressing or buffing shock is required for the National M-17-A in order to produce that total travel?

A. It will require 18,000 foot-pounds, which would be equivalent to a couple of loaded cars striking at four to five miles per hour.

Q. You spoke previously of three to five hundred thousand pounds?

A. That would be the static load or slow load that would have to be put on to do that.

Q. In the buff position, are the springs compressed?

A. They are.

Q. To what extent?

[fol. 3100] A. To within, just within being solid upon each other. The design requires that they must not go solid on each other, but must go solid on the housing, or a solid member of the draft gear.

Q. Are the friction members of the draft gear in contact?

A. They are.

Q. To what extent?

A. To the extent of resisting the three to five hundred thousand pound push that is being put on that.

Q. Now, going to the lower drawing, the one entitled "Pull Position," in what position are the couplers shown there?

A. The pulling faces are in contact with a seven-eighths inch space between the buffing faces.

Q. Is that the same seven-eighths of an inch that you designated previously as the free slack at the coupler faces?

A. It is.

Q. What has happened to the coupler horn with relation to the striking casting?

A. That is pulled away from the striking casting two and three-quarter inches over the three inches of its normal position, or five and three-quarters inches out.

[fol. 3101] Q. And is this pull position representative of the position which would be found where a locomotive is coupled to, and exerts a pull on a car?

A. That is an extreme position. A locomotive couldn't ordinarily exert that much pull; three hundred to five hundred thousand pounds.

Q. If the car were anchored and the locomotive were pulling, you would get something approximating this pull position, would you?

A. You would get half or a third of that possibly.

Q. Now, in the drawings marked "Pull Position," what is the position of the front of the draft gear? Is it the same in the normal position at the top of the sheet?

A. The first, the wedge part and follower are the same, they are contacting the pulling lug of the underframe, but the yoke and coupler butt have pulled away from the follower, and your force is exerted on the tail end of the yoke against the bottom of the draft gear.

Q. Is the draft gear itself in compression in the same manner as in the center drawing?

A. Absolutely. The only difference is that in the center drawing you are pushing on the head against the rear draft lugs, on the bottom drawing you are pushing against [fol. 3102] the front draft lugs.

Q. Do I understand, then, that whether you have extreme buff or extreme pull position, the draft gear is compressed in either event?

A. It is.

Q. Is that the normal functioning of every type of draft gear?

A. Every type of draft gear. They are never in tension, they are always in compression, either from the head backward or from the tail forward.

Q. Are the friction members in the same position with respect to each other in the pull position as in the buff position?

A. They are.

Q. And does the two and three-quarters' inches shown here represent the maximum amount of travel according to the specification and standard?

A. It does.

Q. Now, are draft gears in actual practice, particularly of the type represented on this drawing, are they ever lubricated, that is, intentionally lubricated?

A. There is one type built with lubrication.

Q. I mean, the M-17?

A. In the M-17, they are always in dry friction?

Q. Is there any type other than the one you have men-
[fol. 3103] tioned which is subject to lubrication?

A. Not intentionally, that I recall.

Q. Suppose that oil were to be spilled on a friction draft gear such as the M-17-A, would that rob the gear of any of its essential qualities?

A. It would reduce its resistance from a combined friction and spring to merely the value that the springs have in resisting compression.

The Court: But they are not intended to be oiled in any way?

A. Not the friction draft gears, with that one exception that I mentioned, the Edgewater, which is a ring-spring gear, and to avoid wear they are lubricated. The earliest one wasn't oiled either, but they got better work out of it by putting in a lubricated friction and spring.

The Court: The witness has indicated a time or two that he wanted to illustrate all this, and I suggest that off the record, because it wouldn't make much sense, that he do that now. Will you explain the model to us?

(Thereupon the witness explained the workings of the model draft gear to Court and counsel off the record.)

The Court: I think that illustrates it.

Mr. Mason: Mr. Bohnstengel, have you seen the National
[fol. 3104] M-17 and National M-17-A in actual service?

A. I have, yes, sir.

Q. Have you seen it applied to Southern Pacific cars?

A. I have.

Q. To Pacific Fruit Express Company cars?

A. Yes, sir.

Q. Santa Fe cars?

A. Yes, sir.

Q. Have you seen the various other types of friction draft gears now in use?

A. I have, yes, sir.

Q. And seen them applied also?

A. To various cars.

Q. Including Southern Pacific and P. F. E. cars?

A. Yes, sir.

The Court: Is there any particular difference in the coupler on the froight car, for instance, and on your passenger cars?

A. From Type E and D, from here (indicating) ahead, no. But from here back it may have a longer shank, may have a 60 or 70-inch coupler shank and fastened with a tail-pin instead of a key to your car, the reason being that on a passenger car you have the vestibule, you see, to get out under to the head end of the car, you need more coupler [fol. 3105] length and still put your draft gear back in the solid underframe of your car.

[fol. 3106] Mr. Mason: The coupler from the coupler horn forward is the same or substantially so?

A. Excepting tight lock. Tight lock has some gathering features that are not present in freight-car arrangement.

Q. You spoke in your reference to exhibit No. 210 of two and three-quarter inches as the travel of the draft gear in either direction. Is the same specification followed on other standard friction draft gears?

A. It is, yes, sir.

Q. Do they observe actually any lesser measurement than two and three-quarter inches or is that the standard?

A. Not less than two and one-half nor more than two and three-quarters, two and five-eighths is a pretty good average.

Q. You have spoken so far in your testimony largely of the friction-type draft gear. I take it that the National M-17-A represents the friction type draft gear?

A. It does.

Q. And that appears from the exhibit to be a combination of friction and springs?

A. It is.

Q. Do the springs themselves come into the picture and [fol. 3107] play a part in the operation as well as the friction members?

A. They do.

Q. Is there another type of draft gear heretofore in use other than the friction and spring or the friction draft gear represented here?

A. There is.

Q. Will you describe it?

A. The tandem spring was extensively in use before friction draft gears were developed.

Q. What was the earliest type of draft gear used in freight-car operation? Have you made any study of the history of draft-gear evolution?

A. There was none in the earlier years. It was simply connected to the car body and pulled on the car body, the resiliency of the car body was used as a means of cushioning.

Q. You mean the coupler was attached directly to the car?

A. Yes, or to draft rods passing under the car.

Q. What was the next development after it became necessary to provide some means of fastening the coupler to the car? Was there a spring used?

A. A spring was used, either a single, twin, or tandem.

Q. Is the tandem draft gear a gear still in use at [fol. 3108] times??

A. Yes, sir.

Q. About how much travel is there in a tandem spring draft gear ear to your observation?

A. Two to two and one-quarter inches.

Q. Is the friction draft gear a development from the tandem spring draft gear?

A. It supersedes the simple spring arrangement to get greater capacity.

Q. In the tandem spring draft gear as compared to the [illegible] pounds, which you mentioned as the force required for complete closure of the friction gear, how much force is required to develop the two to two and one-quarter inches of travel?

A. From sixty to sixty-five thousand pounds, but may I add that in some types of gears which are used on pas-

senger cars and that we use on locomotive tenders we still maintain for inch and one-half and for inch and three-quarters that tandem spring characteristic and have a combination of spring and friction as differentiated from simple friction or tandem spring.

Q. That is only on passegner cars and locomotives, is it?

A. We also have some of those on way cars as an easier cushioning device.

[fol. 3109] Q. Why is it necessary to have a draft gear on a freight car instead of having the coupler bolted directly to the underbody of the car?

A. You need a yielding resistance to protect equipment and also to guard against shocks.

Q. Does the draft gear play any function in absorbing shocks?

A. It does.

Q. Does it play any function in permitting easier starting of the train?

A. It does.

Q. Will you describe just how it functions in that respect.

A. The draft gear will move or yield under a load that the locomotive can put on that draft column in the so-called "taking slack" operation, and then start with a lesser pull than it would if you had to start the dead body of the train itself.

Q. Is this seven-eighths of an inch of free slack a part of the construction for the necessary functioning of the train in starting?

A. It is.

Q. What does that serve?

A. It serves as a yielding play or movement in making turn-outs, negotiating curves, and over bumps and through [fol. 3110] dips to avoid knuckle and coupler strain.

Q. Is there any other motion in the draft rigging other than the two and three-quarter inches of draft gear travel, and the seventh-eighths of an inch at the coupler faces which is developed in actual operation?

A. There is.

Q. How is it developed?

A. Due to wear and upset parts.

Q. You mean actual distortion or breakage?

A. No, the continuous bumping of the end of your coupler would shorten it to a certain extent, a thirty-second or sixteenth of an inch or so, and your draft gear key illus-

trated in the drawing, the coupler yoke key will show a certain amount of wear where it is contacting and pulling the load, and gradually develop a little extra free slack.

Q. How much can be developed before the draft rigging has to be replaced?

A. The sum total, I believe, that the Association permits is one and one-half inches all told.

Q. Including the seven-eighths?

A. Exclusive of that seven-eighths per car end, but I don't recall ever seeing that much develop in any cars I have inspected.

The Court: We will take our noon recess at this time.

(Thereupon the court stood at recess until two o'clock this day.)

[fol. 3111] January 28, 1941, Two o'clock P.M.

The witness Walter Bohnstengel was recalled to the stand, and proceedings were resumed as follows:

The Court: You may proceed.

Mr. Mason: Mr. Bohnstengel, do all gears now in use; by that, I mean particularly friction draft gears of the type indicated by your exhibit 210 meet substantially the same standards as to capacity to absorb compression or shock?

A. They do.

Q. And what is the standard which they have to meet?

A. It is the specifications of the manual of Association of American Railways.

Q. Well, pounds of force applied to the gear to produce compression; what is the minimum amount of force?

A. Expressed in foot pounds, 18,000 foot pounds, or the equivalent of three to five hundred thousand pounds of push.

Q. You speak of three to five hundred thousand pounds of push. Is that the same character of pounds that are used in measuring the tractive effort of a locomotive?

[fol. 3112] A. The same designation, same values.

Q. Suppose we have a locomotive with tractive effort of 124,000 pounds coupled to a car equipped with a gear such as the M-17; does that mean that the locomotive can

pull only 124,000 pounds at the coupler to attempt to close the first draft gear?

A. That is all it can on slow steady load; that doesn't include impact.

Q. I am speaking of pull.

A. You are correct there.

Q. When pull is applied or impact is applied upon a draft gear, a certain amount of energy is required in order to apply that impact or pull, is it not?

A. Yes, sir.

Q. What becomes of that energy in so far as the draft gear is concerned?

A. The compression of the springs through distance against resistance and heat.

Q. You speak of heat. Is some of that energy passed off as heat by the draft gear?

A. A certain amount depending on how much is put in there.

Q. Where is the heat developed, and where is it dissipated?

A. Between the friction surfaces and radiated to the [fol. 3113] atmosphere.

Q. Then the function of the friction members is to transfer the energy of the striking or pulling, in so far as the draft gear is concerned, into heat which is dissipated into the air?

A. Yes, that would be the interpretation.

Q. Is it possible by the tests which you have mentioned, to develop the amount of compression for which a draft gear is built and the amount of its capacity?

A. That is one of the purposes of the test.

Q. Is it possible to measure the amount of compression as to capacity accurately or precisely?

A. Fairly so.

Q. Within what limits expressed in percentage?

A. It ought to be within ten per cent or less.

Q. Would it be as close as five per cent?

A. Probably as close as that, depending on how slowly you go to it, to repeat your operation.

Q. Have you, on the Santa Fe, made any tests of draft gears in actual operation upon particular cars?

A. We have, yes, sir.

Q. Will you describe the test that you have in mind?

A. In 1927, after some tests that we had made of draft [fol. 3114] gears, a joint test sponsored by the New York Central, the Santa Fe, the Milwaukee and the Nickle Plate Railroads, we built 150 70-ton gondola cars for sulphur service, hauling sulphur between Galveston and the mines, and as these cars operate in one particular service and in a restricted territory, it was decided to put six different kinds of draft gears, 25-car sets each, on these 150 cars. At that time we put in Cardwell Miner, National M-17, Edgewater, Waugh-Gould, and Westinghouse, and these cars were inspected to start with, at the end of three months, then six months, and then a year, two-year periods, with the idea of observing the action of the draft gear and the behavior, anything that could be seen from it, and measurements as to slack development, to get an idea of which would be the most desirable draft gear of the groups that were then available and considered satisfactory for freight service.

[fol. 3115] Q. Are some or all of these 150 gondola cars still in service?

A. They are, yes.

Q. Have you made further inspections of that equipment during the past two years?

A. The last inspection that I started on was early in December of last year. I didn't follow it through, I had an assistant follow it through and haven't had time to analyze the figures.

Q. Did you endeavor by that experiment or test to develop the capacities for wear and the endurance of the draft gears as well as their characteristics in service?

A. Observation to notice the performance as indicated by its action on the coupler.

Q. From your experience, Mr. Bohastengel, is it possible in actual operation to develop full compression or full extension of a draft gear?

A. Not simultaneously. You can develop one or the other with suitable conditions, but in actual service conditions you wouldn't have a condition that would develop from one extreme to the other.

Q. Would the maximum travel be developed from normal to, let's say, full buff position in an ordinary operation?

A. That would be possible, yes.

[fol. 3116] Q. Will you give us an example?

A. A train moving and setting the air on the locomotive, the train would push into a full buff of gears throughout part of the train at least.

Q. Suppose that you make a switching coupling between locomotive and car or between two cars, let's say, at a speed of four or five miles an hour, will that develop a full buff?

A. That will probably develop a full buff and also a reprimand for doing it.

Q. That would be rather a high-speed coupling, would it?

A. I would consider it so, yes, sir. There is no objection to moving four to five miles up to the place you are going to make the coupling, but to make it at four or five miles is rather severe.

Q. Will that severe coupling develop full travel from full extension to full compression?

A. It will develop it from normal to full compression.

Q. From normal to full buff, it is under compression at either of the extremes?

A. It might do this, when you make that kind of a coupling, it might kick the one or two cars ahead hard enough to jerk and break the knuckle. It might go in with a double [fol. 3117] action of compression and jerk, but they would be successive.

Q. You speak of breaking the knuckle. I take it that the various parts of the draft rigging are built to a certain standard of resistance to force, is that correct?

A. They are, yes, sir.

Q. What is the standard resistance to force of the coupler head apart from the knuckle, disregarding the knuckle for the moment, what is the breaking point there?

A. It is usually considered six hundred thousand or over.

Q. What is the breaking point of the coupler shank?

A. That would be as a unit from knuckle to shank because you would have to put a high elastic or especially strong knuckle in to develop the full strength of your coupler.

Q. Have the draft lugs in the gear pocket any standard of resistance to breakage or distortion?

A. They try to exceed the strength of the coupler or knuckle or yoke so that the removable member will fail before those elements will fail.

Q. As to the draft gear itself, as you said, it will go solid after a million pounds more or less?

A. Something of that nature.

[fol. 3148] Q. What is the breakage point?

A. The members being under compression at all times will begin to shorten at seven or eight hundred thousand or maybe a million pounds and your specifications allow only a certain amount of shortening, based on a certain number of over solid drops.

Q. The knuckle itself, is that built to a particular breaking point?

A. The older knuckles were in the neighborhood of 350,000 to 400,000 pounds. Newer type D, which has been in service for many years are usually thought of as about 500,000 pounds and the type E possibly around 525,000 pounds.

Q. Matching all these together, the knuckle appears to be the weakest member of the entire chain of connections collectively known as the draft rigging?

A. That is the intention, that is the easiest member to replace.

Q. Is it, so to speak, the fuse?

A. Just exactly, that would be the electrical designation of it; the part that would yield with the least amount of injury to equipment.

Q. When a train is made up and is traveling on the line, how much of the movement of the draft gear will be de-

[fol. 3149] veloped in ordinary operations?

A. That depends on your grade and the speed at which you are going. If you are starting and developing full locomotive tractive effort, 75,000 or 100,000 pounds, you will probably develop one-third or half travel of the draft gear from neutral to the full position. If you get a jerk in there, you may get a little more.

Q. Would that occur throughout a train of one hundred or one hundred twenty-five cars?

A. That would occur at the head end; the tail end would follow with less effort.

Q. Would this travel that you speak of in the draft gear be in addition to the seven-eighths of an inch of what you call "free slack" at the coupler facing?

A. It would; yes. By way of explanation there, I might point out one thing, that seven-eighths of an inch of so-called "free slack" in your knuckle, when you round

a curve or turn-out you have nothing. It is utilized to permit an angling of your coupler and it would disappear. If you didn't have it there, your train would naturally put it there and strain your equipment, so design has put it there to start with.

Q. Would it be possible by the application of a steady [fol. 3120] pull of a locomotive of a train which was being started and moved to develop the entire two and three-quarter inches of travel from normal to pull position, which is indicated by the lowest of the three drawings on exhibit No. 210?

A. It would be in the head end of the train on a number of cars but not on the rear of the train.

Q. You say it would be possible to develop the full travel by applying 124,000 pounds of tractive effort to the front car?

A. Not by 124,000, it would take more than that either in pull or in impact.

Q. I spoke of a steady pull.

A. I didn't understand it. I missed the "steady"; I understood "pull."

Q. In your experience, taking into consideration both the free slack at the coupler faces and the controlled resistance in the draft gears, what is the approximate amount of the movement per car of the train which would be developed in service conditions in the ordinary freight train expressed in inches?

A. A little over six inches.

Q. Will that be the average amount of motion including both free slack and controlled resistance?

A. That has been my experience.

[fol. 3121] Q. Have you conducted tests or measurements for the purpose of arriving at that figure?

A. We have.

Q. How do you get at that figure of six inches plus apart from any experiments or any trains that you have seen operating? Can you point out the factors on the drawing, exhibit No. 210?

A. If you are operating your train on some pull, you will extend part of that two and three-quarters inches at the head end of the train and very little of it past the middle or rear end of the train because your draft gears normally have five, ten, to fifteen thousand pounds initial compres-

sion, or it would take a pull of that much to even start them moving. If you were to set the brakes suddenly and could realize a complete compression from them throughout the train, you could only realize the two and three-quarters inches maximum plus your seven-eighths, or just a little over three inches per car end or a little over six inches per car throughout the train. You couldn't be fully extended throughout the train and then get full compression throughout the entire train. That is not a physical possibility in train operation.

[fol. 3122] The Court: Are you making any allowance in that computation for the play that you testified to this morning that would occur after the parts had been in use for some time of one-and-a-half inches?

A. That one and one-half inches, your Honor, part of it, assume that a half inch of it would develop in the gear pocket where you normally have two and three-quarters inches of engagement, and you develop one-half inch of free play in that gear pocket, that would restrict your controlled movement to two and one-quarter inches, it would take care of most of it, but not quite all of it. My figure, to answer your question without the illustration, it would take care of most of that inch-and-a-half allowable free slack.

Mr. Mason: And another portion of that inch-and-a-half is simply additional wear at the coupler faces over and above the seven-eighths' inches, isn't it?

A. No, that inch-and-a-half is from the coupler horn back.

Q. Now, do draft gears operate in one manner to absorb or reduce shocks which may arise in the movement of the train?

A. That is one of their functions.

[fol. 3123] Q. In what way do they operate to that end?

A. They cushion and gradually hold back as far as they can an impact that is coming toward closing them, instead of having a buff with a high shock, they cushion it the same as you would with your hand.

Q. Do the draft gears in actual operation tend to increase or reduce shocks at the rear end of freight trains?

A. They tend to reduce them.

Q. Suppose that because of features of operation, such as the movement of a train over a slight hogback or hump

or slight sag in the lines, there is a difference in speed as between adjacent cars or cars in different parts of the train, do the draft gears tend to absorb those differences in speed?

A. Yes, sir, they do, they iron it out and even it up.

Q. Does the draft gear function generally in any respect like the net of a trapeze performer?

A. That would be one way of thinking of it, it yields and then comes back to be in position to yield again.

Q. We have before us on the table here and in the drawing the reduced size of draft gears you testified pre- [fol. 3124] viously. What does the National M-17-A Draft gear actually weigh?

A. About 400 pounds. I would have to check my figure on that. I don't recall. I made tabulations some time ago, but I didn't try to commit them to memory.

Q. I show you a tabulation which appears to be in your handwriting and ask you if you will show that to Mr. Strouss, although it is your handwriting.

A. The weight in pounds of the National M-17, the second one with one follower, 441 pounds. The follower weighs 71 pounds, so it would be 370 pounds for this much of the draft gear, and the follower 71 pounds, 441 pounds.

Q. Now, what are the foot-pounds of capacity that that draft gear has?

A. On the official test, the average is 20,700 foot-pounds.

Q. What is that equivalent to in pounds of the same character as are used in measuring tractive effort?

A. That would be about 495,000 pounds.

Q. Is that draft gear generally typical as to weight and capacity in foot-pounds or any other measurement that you have recited?

[fol. 3125] A. The lowest weight that I have recorded is 333 pounds, and the highest weight 520 pounds for a draft gear for one car end, not both draft gears.

Q. There is a draft gear, of course, at each end of every freight car?

A. Yes, sir.

Q. Are there draft gears of higher capacity than the National M-17-A?

A. There are draft gears of higher capacities, and there are individual draft gears of the M-17 type that will, as they get a truer friction surface, develop higher capacity.

Q. But the capacity you spoke of, 495,000 pounds, is representative of the class?

A. It is representative; it may be a little more or less; it must be at least 18,000 or 440,000 pounds, something of that magnitude.

Q. You say 18,000?

A. 18,000 foot pounds.

Q. Just for the sake of the record, Mr. Bohnstengel, will you describe what you mean by a foot-pound? Do I understand that that is the force developed by the movement of a pound one foot vertically?

A. The way foot-pounds are figured in draft gear tests is to raise a hammer, let us say, the old 9000 pounds one [fol. 3126] foot, and that would be 9000-foot pounds, or if it drops two feet it develops 18,000 foot-pounds potentially at the instant that it strikes.

Q. I understand that that is complicated by the fact that where gravity is the impelling force the force increases with the square of the distance, doesn't it? Isn't there some such formula as that?

A. Yes, energy varies as the square of the impact speed, doesn't it; isn't that the relation?

Q. I remember some formula which would indicate that the energy of dropping 9000 pounds two feet would be greater at the point of impact than the energy of dropping 18,000 pounds one foot, because of the difference in the length of travel. 18,000 pounds dropped one foot would be 18,000 foot-pounds, but that doesn't work indefinitely; if you were to stretch it out to 300 pounds dropped thirty feet, you would get more than 9000 pounds dropped one foot?

A. By way of explanation there, a car coupling at two miles per hour has an impact force of four, the square of two; or four; at three miles per hour, the impact value, or the destruction value is nine. It varies as the square [fol. 3127] of your impact speed.

Q. Now, getting to the dropping of a weight, the law of gravity leads to the conclusion that the greater the distance of drop, the greater the speed at the point of impact; isn't that right?

A. I think that is right.

Q. And by that same formula, the force is equal the mass times the square of velocity?

A. Mass times velocity squared.

Q. A lesser weight from a greater height would lead to more force at the point of impact than to drop a greater weight a less height, even though the product of height times weight would be the same in both cases?

A. You are quizzing me on mathematics that I haven't thought of for some time, your Honor.

Q. I will abandon the question. Why did you go from a 9000-pound hammer to the 27000-pound hammer?

A. Because of the great surface disturbance and heat created by impact, which would not be as representative as a lower drop which just had the foot-pounds available.

Q. Which, in other words, represented merely the application of the weight without the force of the drop, is that correct?

[fol. 3128] A. Yes; in other words, if you take a small hand hammer and hit a heavy object at a high speed all you do is to disturb the surface. If you take a massive weight and just drop it at a small height but enough to be greater than that would resist, it would put an actual bend in it. You could hit all day with a small hammer and, surface-peck the thing. By the way, that 9000, I understand, was an accident too. They had a ten thousand weight on their first hammer, where I can't tell you, but they were going to use the 10,000 pound weight to do their dropping and they didn't have enough motive power to lift it; so they took off a thousand pounds to fit the job to the conditions that existed.

Mr. Mason: I think that is all. Thank you, Mr. Bolinstengel.

Cross-examination.

By Mr. Strouss:

Q. I had intended to ask you the question Mr. Mason asked you about the effect of speed, what effect it would have as to increasing the force of the impact. That law of physics was mentioned, mass times velocity squared is the force that applies not only in the case of gravity but any [fol. 3129] time where there is speed applied, Mr. Bolinstengel, mass applied to force, isn't that true?

A. I believe it does. Now, you see, with the 9000-pound hammer, we went up in one-inch increments, with the

27000-pound hammer they go up in half-inch increments, or quarter-inch increments.

Q. But, using an illustration other than the application of the force by gravity, using the locomotive that Mr. Mason referred to.

A. Yes.

Q. Having a tractive effort of 124,000 pounds, of course, the force with which the pull or impact the force pulled at the time of pull or impact would depend upon the speed as well as the tractive effort of the locomotive, isn't that true?

A. You could run into it, you could take slack and then run and you have your equation of tractive effort, it wouldn't hold at all.

Q. Well, your mass by velocity squared——

A. Well, you are developing kinetic energy.

Q. Would the formula of mass times velocity squared apply?

A. It would apply in that case.

Q. The same way with a car, the mass of a car, the pull or impact would depend upon the speed with which it is moving?

[fol. 3130] A. Yes, it is proportional to the mass and the velocity squared, if I remember, the impact.

Q. I just wonder if you would agree with this statement, Mr. Bohnstengel: "Draft gears in fair to good condition are not pushed in for pulled out, they are either driven in or jerked out, both implying a severe shock." Do you agree with that statement?

Mr. Mason: May I ask what document you are reading from, Mr. Strouss?

Mr. Strouss: I am reading from the air-brake rules and regulations of the Southern Pacific Company.

A. As a regular operating condition?

Q. Yes.

A. You don't get that at a truly slow speed, you have to have something more than a run-in or a push; there has to be some kinetic energy there, rather than just slow moving.

Mr. Strouss: Or, as used here, driven in or jerked out.

A. Driven in or jerked out.

Mr. Strouss: That is all.

Redirect examination.

By Mr. Booth:

Q. Take an automobile weighing a thousand pounds and [fol. 3131] running into a stone wall at the rate of five miles an hour, a speed of five miles an hour, does it make any difference whether that automobile travels twenty feet or twenty miles at five miles an hour as to the impact?

A. If, at the instant of impact, it is going five miles an hour, that is the thing that counts. How long it was in getting that speed wouldn't be a factor, it is just what it is doing at the instant of the impact.

Q. If one car runs into a stationary car at the rate of five miles an hour, it doesn't make any difference how far that car has run?

A. No, it is the rate at which it strikes.

Mr. Booth: That is all.

Mr. Strouss: That is again the application of that formula?

A. Yes, MV Square.

Mr. Strouss: That is all.

The Court: There is one question the Court would like to ask. This exhibit 210, of course, I take it, purports to show a single draft rigging complete with the coupler on the left here, which, I take it, is attached to the other car?

A. Yes, sir.

Q. Now, in making your computation as to the slack or [fol. 3132] play, if I may use those terms, I have forgotten what you used, between the two cars, are you taking into consideration the play in the draft-gearing at the end of the car where the coupling is made?

A. There shouldn't be much play in the draft gearing itself in the pocket.

Mr. Mason: I think what his Honor meant was, did you take into account your six plus inches per car in the train, the play in the draft gear at the end of each car, plus whatever play there may be in the couplers, is that what you had in mind?

A. That is what I tried to do when I was adding two and three-quarters for the one and two and three-quarters for the other, that is five and a-half, plus your seven-eighths,

is six and three-eighths, plus some free slack between six and seven inches, that is what I had in mind from a neutral to a fully compressed condition.

The Court: Then, in any given train length if you would multiply the number of cars by six inches plus, you would arrive at the total possible slack in that train?

A. The slack that you would ordinarily be able to develop by tying down an end and pushing in and pulling out. Now, you could run in real hard, tie down with a couple [fol. 3133] of locomotives at the end and get a lot of impact; you could increase that, but what you could develop ordinarily under normal operating or handling conditions, that is what I tried to show. You see, potentially you have four times this two and three-quarters plus the seven-eighths before you would start breaking anything, but you can realize of that only a little over six inches per pair of cars or per car. Do I make myself clear there?

The Court: Yes.

[fol. 3134] Mr. Mason: You spoke of slack in answer to the Court's question. Do you have in mind the two components of that slack that you described before, controlled resistance in the draft gear and the free motion of the couplers?

A. I was using the Judge's broader term as it is occasionally used in operating, slack, whether it is controlled or free.

The Court: Do I understand you in normal operations the weak point in this connection is the knuckle?

A. That is the intention of car construction because all you need to do is to pull the pin and put in a new one, while if you break a coupler your car is disabled and has to go to the repair track, or if you break a yoke your car is disabled.

The Court: In normal operations, would it ever occur that this draft gear would be pulled out? By that I mean that your break would occur there?

A. The possibility would be that these lugs designated as front draft lugs, that that bunch of rivets could be sheared. If they had less than the 500,000 pounds strength, you might pull coupler, yoke, draft gear, and all out. In other words, you would get the whole insides out of the [fol. 3135] car.

The Court: Does that occur in normal operation?

A. The cars are at present built or riveted strongly enough so that there is a good safety factor for the yoke or the knuckle. It is rather expensive to get that part when a lesser thing would be better to come out.

Mr. Mason:

Q. Mr. Strouss asked you in referring to page 12 of the Southern Pacific's air brake rules and regulations whether you agreed with that statement as to draft gears, that they are either driven in or jerked out. Do you necessarily mean in your agreeing with that statement that they will be either driven in or jerked out to the full extent of the two and three-quarters inches of travel indicated by exhibit No. 210?

A. The answer that I had in mind, Mr. Mason, was that we seldom slowly push in or slowly pull out a draft gear. In other words, you may get the first one but by the time you reach the second or third one you are moving to a certain extent and you get that much of an impact drive or impact jerk. It doesn't necessarily mean that it will come all the way. It may come halfway or two-thirds of the way [fol. 3136] or get the next car started without coming at all.

The Court: What happens to your draft gear, if anything, we will say with a head-on collision? Does it have any injurious effect to your draft gear rigging?

A. With a head-on collision?

Q. Or rear-end either; I take it the effect would be the same?

A. I would look for coupler shank shortening, your coupler shank should begin to shorten at about 600,000 to 650,000 pounds. You would absorb a little of your work and energy in shortening that. You would compress your car underframe; you might shear off some of the lugs, depending on how heavy the shock or uncushioned the shock would be. You might shorten a draft gear housing one-eighth or one-sixteenth or three-sixteenths of an inch. You could stretch the yoke to a certain extent or bend the key in a little bit where it pushes on the key or if it reaches that far. There would be several places of give and then it would tend to spring back again. Your car frame I think is built for about 800,000 pounds push before it starts to

yield and that would mean you would have some elastic compression of that which would spring back when your force was taken off.

[fol. 3137] Q. I believe you testified that so far as draft springs themselves were concerned that they were so cushioned and protected that they couldn't be broken?

A. The specifications require that they be so designed in length and spacing that the gear should go solid on its housing rather than solid on the springs with just the thought that you expressed that they should stay operative. If you would put the springs solid first, as some defective draft gear might in older times, you would tend to break the coil springs and would have an inoperative draft gear as the result.

Q. I notice that this exhibit refers to M-17, M-17-A and M-17-A (Certified). Do those cover essentially the same type of draft gear rigging but the later numbers having some slight improvement, or what does that indicate?

A. The M-17 draft gear was the designation under which the National Malleable and Steel Castings Company marketed a gear of essentially these dimensions, sizes, and parts. Then after a few years' service they found that these brass pads in the wedge were battering down or beating out, due to lack of lubrication, so they put in graphite plugs in there and changed the angle of the wedge [fol. 3138] two degrees from thirty to thirty-two, as I recall, and improved the wear by case hardening the stem from 400 Brinell to 700 Brinell hardness and left the wedges at 400 and gave that gear a new designation, M-17-A, under which designation it was tested and approved according to the specifications of the Association of American Railways. Then a few years later they obtained permission from the American Railway Association to take some of the older gears that had been sold or had been manufactured and might not have been sold but were on hand, several thousands of gears, and replaced parts in those gears to make them the equivalent of the M-17-A as far as their tests show, which they designated as the M-17-A (Certified) gear. Your M-17-A (Certified) would have a date prior to the time that they got their certificate of approval, it would have a casting date.

Q. But the basic principles in all three are the same?

A. If they would set the three out here, unless you knew the details of difference, you probably wouldn't be able to

recognize or distinguish one from the other, they would look essentially the same. They may have had several thousand draft gears on hand which couldn't be marketed [fol. 3139] as a certified or approved gear.

Mr. Mason:

Q. They couldn't be marketed as M-17-A unless they were fixed up?

A. Unless they were conditioned to be the equivalent of them.

Q. Did you make an inspection of the P.F.E. yard here in Tucson to see whether the National M-17 or M-17-A gear was applied?

A. I did, yes, sir.

Q. Do you remember how many cars you examined?

A. I think I examined about 244 car ends.

Q. How many National M-17-A's did you find in percentage?

A. Approximately 20 per cent, a little over 20 per cent were M-17-A's, without knowing whether it was M-17 or M-17-A, but the M-17 National gear.

The Court: You stated that these gears known as M-17 have been in use since the year 1925?

A. That is when the earliest service applications were made as far as I can find out. I rode back of some of them around 1925, as I recall, or late in 1925, in locomotive tenders.

Q. Do I understand that this particular type of draft gear designated on this exhibit No. 210 is considered the latest word in draft gears in railroading?

[fol. 3140] A. One of a group, not picked out as an individual but picked out as one of a group of a dozen draft gears.

Q. Do these other draft gears have the same basic principles or in what respects do they differ from the one shown here?

A. The Miner draft gear instead of using a stem with your friction segments around it, uses a barrel with friction shoes in it and a wedge and drives out; it uses a spring. I made some sketches just for my own information on that. Waugh Gould of which there are a good many in service use a pair of half-wedges and flat curved springs in between them to give the friction action. The Edgewater, which is

an approved gear, uses rings about one and one-half inches thick and nine inches in diameter, an inside ring and outside ring of corresponding taper and they force probably a pile twenty inches high, which would be in the neighborhood of twelve or fourteen rings, and they push them together, which when they go solid they go solid on each other. The Waugh-Gould 410 has put the springs on the outside and put the wedges in between. The Peerless, the Westinghouse, they use a barrel with a wedge to drive shoes out into the barrel and keep from pushing it in and a spring, [fol. 3141] of course, inside the barrel to keep the whole system tight, and the Cardwell, which if you have ever looked under a freight car is the one that has two broad springs on each side of the draft gear. They keep tension on some wedging elements which straddle some triangular shoes but it is all a principle of either barrel or stem and wedge and shoe, spring controlled, so that you get a component of your spring action translated into friction to give you the desired capacity which in the old A.R.A. tandem spring would be from sixty to sixty-five thousand pounds, as I stated this morning, and in this will be from three hundred to five hundred thousand pounds with less tendency to recoil.

Q. Then do I understand that the mechanical division of the A.A.R. of which you are a member approves of all the different types you have been describing here just now?

A. As shown in the Code of Rules, yes, sir.

Mr. Mason: One other question; you spoke of observing on the P.F.E.'s that you inspected some 20 per cent of National M-17's or M-17-A's. Were the other 80 per cent all friction and spring draft gears?

A. On the P.F.E.'s I saw no spring draft gears. I saw [fol. 3142] one Bradford rocker type, which is a spring and lever combination. I saw some Edgewater ring springs, some Waugh-Gould's as I just described, some Miner.

Q. Were they all friction draft gears?

A. They were all friction draft gears, yes, sir.

Mr. Mason: That is all.

The Court: We will take our afternoon recess at this time.

(Thereupon a short recess was taken, after which proceedings were resumed as follows.)

Mr. Mason: I take it that Mr. Bohnstengel is excused.
Mr. Strouss: Yes.
(Witness excused.)

B. S. Sines was recalled for further

Direct examination (continued).

By Mr. Mason:

Q. Mr. Sines, have you a statement before you in one sheet entitled, "Number of Passenger Trains of Different Lengths between El Paso, Texas, and Tucumcari, New Mexico, Year 1939"?
[fol. 3143] A. I have.

Mr. Mason: May we have this statement marked "Defendant's Exhibit No. 211"?
The Court: It may be marked for identification.
The Clerk: Defendant's exhibit No. 211 for identification.

Mr. Mason:

Q. From what sources was this exhibit prepared?
A. These were made from the passenger conductors' wheel reports for the territory El Paso-Tucumcari.
Q. Was it prepared under your direction?
A. It was.
Q. Has it been compared against the original sources?
A. Yes.
Q. Will you refer to the previous exhibits and state whether or not this exhibit is in any sense a companion?
A. It is companion to exhibit No. 188 previously introduced and completes the showing for the entire passenger operations from Los Angeles to Tucumcari, New Mexico. Exhibit No. 188 covers the territory Los Angeles-El Paso and this one goes on from El Paso to Tucumcari.
[fol. 3144] Q. This is really then a supplement to exhibit No. 188?
A. That is right.
Q. And for the same purpose?
A. Yes.

Mr. Mason: Have you any questions, Mr. Strouss?
Mr. Strouss: No; I have no questions.

Mr. Mason:

Q. Did you state whether the exhibit is true and correct?

A. It is.

Mr. Mason: We offer exhibit No. 211 in evidence.

Mr. Strouss: I object to it as irrelevant and immaterial.

The Court: Objection overruled, it may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 211.")

Mr. Mason:

Q. Is there any figure on this exhibit, Mr. Sines, that you wish to call particularly to the Court's attention?

A. Yes, the figures in the last line showing that during the year 1939 we had occasion to run between El Paso and Tucumcari 52 trains with a consist of over 14 cars.

[fol. 3145] Q. Will you take up now a statement in one sheet entitled, "Tucson and Salt Lake Divisions, Locomotive Assignment as of November 30, 1940"?

A. Yes.

Mr. Mason: May we have this exhibit marked No. 212 for identification?

The Court: It may be marked.

The Clerk: Defendant's exhibit No. 212 for identification.

Mr. Mason:

Q. Did you prepare exhibit No. 212?

A. It was prepared under my direction and checked by me.

Q. From what sources?

A. From report furnished each month by the motive power department showing what the assignment of locomotives has been for the previous month, or, rather, for the month ending with the day the report was issued. You will notice the title says, "Locomotive Assignment as of November 30, 1940." The assignment for that month is for the month of November.

Q. Have you the report for November 30th, 1940, available here?

A. I have.

The Court: This exhibit includes both freight and passenger locomotives, Mr. Sines?

[fol. 3146] A. That is right.

Mr. Mason:

Q. Have you shown the segregation of freight and passenger locomotives for each division as to types?

A. I have.

Q. Is the exhibit true and correct according to the underlying documents?

A. Yes.

Q. Will you furnish that to Mr. Strauss if he wishes it?

A. All right.

Q. When you speak of the Numbers (Not Continuous), does that mean the numbers of the locomotives assigned that fall within the range of numbers as shown?

A. That is right.

Q. Those are simply the locomotive numbers stenciled on the sides of the individual engines, are they?

A. That is all.

Q. They don't have anything to do with the engines other than as a means of identification?

A. That is right.

Q. Has the exhibit been compared?

A. Yes.

Q. Will you say whether it is true and correct?

[fol. 3147] A. It is.

The Court: Isn't it true in numbering those engines, for instance, you wouldn't put a four thousand number on a Mogul, would you?

A. No, those numbers are assigned at the time the locomotive was originally put into service or manufactured and that series of numbers stays with that locomotive until the end of the locomotive's life or until the end of the life of that particular type of locomotive.

The Court: That was my understanding.

A. Yes, sir.

Mr. Mason:

Q. For example, you can always tell that a 3600-class locomotive is in the F type?

A. Yes.

Q. And a 3700 class likewise is a particular series of the F type?

A. That is right.

Q. You can always tell that a 4300-class locomotive is a Mountain type?

A. That is right.

Q. Is that indicated to some extent by this exhibit?

A. Yes; in speaking of engines, railroad employees use all three methods shown in columns B, C, and D to identify [fol. 3148] locomotives or types. They will speak of them as "F's," as "2-10-2's," or as "3700's" and they all mean the same thing.

Q. Even sometimes they personalize the locomotive by calling it "the 3720," don't they?

A. That is right.

Mr. Mason: Have you any questions, Mr. Strouss?

Mr. Strouss: No questions.

Mr. Mason: We offer the exhibit as defendant's exhibit No. 212.

Mr. Strouss: I object to that part of the exhibit relating to the Salt Lake division as irrelevant and immaterial.

The Court: Objection overruled, it may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 212.")

Mr. Mason:

Q. Mr. Sines, the record is not so far I think entirely clear as to the tractive effort of these Articulated-Consolidation locomotives in the 4000 series, which you show in line 12 here. Can you tell from the locomotive books what the tractive effort of that series of locomotives is?

A. Yes, the tractive effort is 90,940 pounds. This is the locomotive book I have here in my hand that you mentioned [fol. 3149] last week, but I didn't happen to have it with me at the time.

Q. What is the tractive effort of the 5000-class locomotives shown in line 15?

A. From the same book, 84,200 pounds.

Mr. Mason: I think the record shows it but I want to be sure.

Q. Is there any other showing on exhibit No. 212 to which you wish to direct attention?

A. With the exception of the Articulated Consolidation engines, the assignments on both divisions are much alike. The passenger power is much the same. The principal passenger engines on both divisions are the Mountain type 1, 3, 4, and 5. We use F-4's and one F-5 on the Tucson division. We use F-4's on both divisions and one F-5 on the Tucson division.

Q. I take it that these Moguls and Ten Wheelers are in use in branch line or other similar service on the two divisions?

A. Yes, branch line and local service.

Q. Have you a statement before you in one sheet entitled, "Lengths and Capacities of Main Line Sidings in Arizona, Yuma-Arizona State Line to Arizona-New Mexico State Line Via Gila and Bowie, Year 1912"?

A. I have.

[fol. 3150] Mr. Mason: May we have this statement marked "Defendant's Exhibit No. 213"?

The Court: It may be marked.

The Clerk: Defendant's exhibit No. 213, for identification.

Mr. Mason:

Q. Did you prepare or cause to be prepared exhibit No. 213 for identification?

A. I did.

Q. And the sources are as shown at the foot of the exhibit?

A. That is right.

Q. Did you insert any information as to the length or anything else shown in columns B and C?

A. Yes, clear length is taken from the Tucson division timetable and the capacity in column C was computed by myself.

Q. You show the bases of the computations, do you, on the exhibit?

A. That is right, in the lower righthand corner.

The Court: I thought the testimony the other day was that the cars had a length of 46 feet?

A. They do now, but this is in 1912 and that length of 44 feet is from our engineering department's records on the basis they were using at that time.

[fol. 3151] Q. But the length now is 46 feet?

A. Yes, the average length of car used in computing siding capacity.

Mr. Mason:

Q. Now as to the locomotive length of 80 feet, is that considerably shorter than present-day main line locomotives?

A. Yes, our main line locomotives now are from 100 to 126 feet in length.

Q. I take it by this exhibit you are attempting to present the situation as it existed in 1912 with reference to 1912 equipment?

A. That is right, to show the situation that existed in 1912 when the Arizona 70-car limit law was passed.

Q. You show the situation as of December 22nd, 1912, by timetable No. 71. Was there any substantial change during the year 1912 of which you are aware according to the records?

A. I don't know. I have the file of all the Tucson division timetables and I didn't examine them particularly to see if anything in particular had occurred in 1912.

Q. Subject to examination of the prior timetables, Mr. Sine, is it fair to assume that this represents the condition as of the beginning of 1912 as well as at the end?

[fol. 3152] A. Yes, railroad plants don't change overnight or in the space of a few months; they are the gradual development of a number of years and within any shorter period of years a statement of this kind probably reflects a condition that existed over a twelve-month period.

Mr. Mason: Have you any questions, Mr. Strouss?

Mr. Strouss: No questions.

Mr. Mason: Do you have the underlying sources in connection with this exhibit available for examination if necessary?

A. Yes, I have the Tucson division timetables, including timetable No. 71, right here with me.

Mr. Mason: We offer the exhibit in evidence as defendant's exhibit No. 213.

Mr. Strouss: No objection.

The Court: It may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 213.")

Mr. Mason:

Q. Mr. Sines, I should like to ask you about some of these sidings. You show, for example, at Mohawk a capacity of 99 cars. Is that all on one siding?

A. No, the information that I took from time-table No. 71 is shown in column B and was expressed in "length of [fol. 3153] sidings, within clearance (feet)." I have duplicated those figures exactly in column B. The timetable does not indicate whether there was one or more tracks at Mohawk at the time the timetable was printed, but there are two tracks at Mohawk now of somewhat similar length and my conclusion was that there were two tracks at Mohawk at the time this timetable was printed because there would be no particular reason for changing the layout at Mohawk by taking up one track.

Q. Or by converting two sidings into one long siding?

A. That is right.

Q. Does the same situation obtain at Aztec where you show 101 cars?

A. Yes, that prevails at Aztec and at other stations where more than 70 cars were shown, say, in the neighborhood of 100 to 125 cars, as, for instance, at Sentinel, there was a yard at Ivalon, the third station from the top on the lefthand side. There are and probably were several tracks at Casa Grande, Red Rock, and then passing over to the Rio Grande division, with which territory I am more familiar than the territory west of Tucson.

Q. You speak of the Rio Grande division as it existed as one time to Tucson?

[fol. 3154] A. That is right. There are and were two tracks at Vail, Pantano, Mescal, Dragoon, Cochise, Willcox, and San Simon.

Q. What about Raso, is that a single siding?

A. I skipped that because I am not sure whether there is one long siding or two there.

Q. Is this district east of Tucson part of the district which you had under your jurisdiction as assistant engineer of the Rio Grande division?

A. I worked on the Rio Grande division in this particular territory for eight years. This was part of the territory I worked in for eight years.

Q. Have you a statement before you in one sheet, Mr. Sines, entitled, "Main Line Freight Trains of Various Lengths Operated between Yuma, Arizona, and El Paso, Texas, Via Gila, Arizona, and Lordsburg, New Mexico, and Via Douglas, Arizona, over South Line during June and August, 1938, Actual Operations Compared with Redispatched"?

A. I have.

Mr. Mason: May we have this statement marked exhibit No. 214?

The Court: It may be marked.

The Clerk: Defendant's exhibit No. 214 for identification.

Mr. Mason:

Q. Did you prepare exhibit No. 214, Mr. Sines?

[fol. 3155]? A. It was prepared under my direction and supervision and I have checked it.

Q. What was the source from which it was prepared?

A. The actual train sheets for the months of June and August, 1938, for the information shown on the lefthand side of the sheet under the caption "Actual" and the redispatch sheets for the months of June and August, 1938, for that portion of the sheet under the caption "Redispatch."

Q. Did you also use the white work sheets A concerning which you have testified?

A. Yes, we worked a two-way check on this exhibit by means of the white work sheets A because they also show train lengths.

Q. When you say "we," you mean yourself and your assistants?

A. Yes, the rest of the train limit party that did the statistical work.

Q. Has the exhibit been compared and checked against these underlying sources?

A. It has.

Q. Are these the same actual and redispatch sheets which have been furnished previously to Mr. Strouss?

[fol. 3156] A. Yes.

Q. And the white work sheets A, have they been furnished to him?

A. They have.

Q. Referring to the actual column here, the exhibit purports to show a grouping of trains according to their length in cars in columns A, B, and C. What train length, or, rather, at what point in the course of the progress of the train across the division is the train taken for the purpose of determining into which classification it falls?

A. This classification is according to the highest number of cars handled at any one time.

Q. I take it if a train had 49 or less cars at any one time it would fall into the classification in column A?

A. Yes, fifty and less.

Q. Is the count taken by examining the story of the train as it is written on the train sheets?

A. Yes.

Q. There are certain computations showing totals and percentages. Are those capable of being made and checked from the face of the sheet itself?

A. That is right. We have used a system of cross-addition and footings so that the computations are auto-
[fol. 3157] matically checked by arriving at the same total at the lower righthand side of the block in each instance.

Q. Will you explain how that is? Do you, for example, in connection with the actual between Yuma and El Paso show a certain total number of trains in column J opposite the words, "Grand Total"?

A. That is right.

Q. Is that total capable of being checked by the subtotals above?

A. That is right.

Q. And also by the column totals to the left?

A. That is right.

Q. And the same would apply to the totals shown in column T?

A. Yes, sir.

Q. Taking everything that appears in the subtotal footings above or the columns to the left as far as the double line?

A. That is right.

Mr. Mason: Have you any questions, Mr. Strouss?

Mr. Strouss: This is a summarization or recapitulation of the information appearing on exhibit No. 198 and other
[fol. 3158] white sheets similar to that covering the redispatch during the two periods and on the territory indicated?

A. That is right, with this additional explanation, that in all cases you will not be able to check the length of the trains off the white sheets because in a few cases the train reached its maximum length between initial terminal and final terminal and exhibit No. 198 simply shows the length of the train leaving the terminal and arriving at the terminal.

Mr. Strouss: That is true of the other white sheets of which this is typical?

A. Yes.

Mr. Mason:

Q. Then it is necessary in this connection to go to the dispatchers' train sheets for a complete check, is it?

A. Yes.

Mr. Strouss: You meant of the actual trains?

A. Of the actual trains for those on the left-hand side of the sheet and the redispatch on the righthand side.

Mr. Strouss: In other words, you would have to go to the train sheets for the redispatch in order to get that information as to redispatched trains?

A. That is right.

[fol. 3159] Mr. Mason:

Q. I take it that arises because some few of these trains may have picked up cars after leaving initial terminal and dropped them before arriving at final terminal?

A. That is right; not many trains do that, but a few.

Q. Is there any previous exhibit showing a train count according to maximum train length to which this exhibit corresponds?

A. I made one for the territory from Sparks to Ogden.

Q. Do you have in mind exhibit No. 186?

A. Yes.

[fol. 3160] Q. Is the train count undertaken here along the same lines and following the same classifications?

A. That is right.

Q. Now, I take it that the results of the entire showing are as indicated by the recapitulation at the foot where you compare actual operations with redispatched operations?

A. You have to do that in two parts. The recapitulations appear for the line Yuma to El Paso via Gila and Bowie

In the upper part of the sheet, and in the lower part of the sheet the recapitulations afford a comparison for the line Tucson to El Paso via Douglas.

Q. This doesn't relate in any respect to the Phoenix line, does it?

A. No, and on this exhibit I didn't attempt to throw the south line operation in with the north line operation to get a grand total.

Q. The Tucson-El Paso via Douglas is entirely separate from the upper part of the sheet so far as totals are concerned?

A. That is right. The reason for that was that the south line operation was affected relatively very little by the redispatch study. We ran the same number of trains in [fol. 3161] the actual as will be observed by reading the last figure in column J as we did on the redispatch, as will be shown by reading the last figure in column T.

Mr. Strouss: Why wasn't the Phoenix line shown?

A. Well, during June and August, it didn't offer any opportunity for redispatching or consolidating of trains, you might say, whatsoever.

The Court: In other words, Mr. Sines, on that particular line, even if the Arizona Train Limit law had not been in force and effect, you would not have been operating any trains over 70 cars in length?

A. It didn't appear so, for the months of June and August, 1938. You note we did make the redispatching study for December, 1938, where we showed quite a change.

Mr. Mason: Have you a subsequent exhibit to cover that?

A. That is right, that is another study that was listed on one of my——

Q. It is listed on Exhibit 197, I think, or 196.

The Court: Mr. Sines, in connection with actual operations, under Exhibit No. 214, it would indicate that the defendant here had studiously lived up to the Arizona [fol. 3162] Train Limit law during those two periods?

A. Yes, sir.

Q. There were two instances where the train had to be broken down at the state line in order to comply, or I should say four instances?

A. That is right, but let me make this clear. It was not necessarily at the state line, it was somewhere east of the state line. We had a record of the trains leaving Lordsburg and for the purposes of this exhibit we did not attempt to show just where those cars had been set out before the trains reached the state line.

Mr. Strouss: Or whether they were destined to the point where they were set out?

A. No, we didn't determine that either.

Mr. Mason: We offer the exhibit in evidence as Defendant's Exhibit No. 214.

Mr. Strouss: We make the same objection to this exhibit as was made to Exhibit 198, particularly to the part of this exhibit covering the redispatch.

The Court: Well, the Court is going to overrule the objection, and admit it in evidence.

(Thereupon the document referred to was received in [fol. 3163] evidence and marked "Defendant's Exhibit No. 214.")

Mr. Mason: Mr. Sines, in your discussion prior to the offer of the exhibit, you said that you operated the same number of trains over the El Paso-Douglas-Tucson line in the redispatch study as were operated in actual operations?

A. Yes.

Q. But, apparently, according to the exhibit, the train lengths were considerably changed in redispatching?

A. That is right. Whereas actually only two trains exceeded 70 cars, our redispatch shows that 51 trains would have exceeded the 70-car limit, or 17.23 per cent.

Q. How did you reach this result of operating 49 more trains with more than 70 cars? Did you operate more traffic over the south line?

A. That is right, we took empty cars off the north line and ran them through Douglas. With one train a day in each direction between Tucson and Douglas, and between Douglas and El Paso, there was still available on the redispatching study, and it was true in actual operations too, although we didn't have an opportunity to avail ourselves of it, there was still available additional engine capacity to haul more tonnage, so we took the empty cars, [fol. 3164] some of the empty cars off the north line, thereby

lightening the burden on the north line and sent them down through Douglas without increasing the train-miles or the train-mile expense doing it, except to the extent that you might burn a little bit more fuel because of the increased distance.

Q. Was this movement of empties predominantly westbound, particularly in June, over the south line?

A. Yes, that is shown in the Tucson-Douglas block, where on the redispatch westbound we operated sixteen trains of over 70 cars.

Q. And the same number between Douglas and El Paso apparently?

A. That is right.

Q. Were you present in the court room, Mr. Sines, when the dispatchers spoke of the unbalance of trains and consequently of locomotives at intermediate points, such as Gila and Lordsburg?

A. Yes.

Q. Does your exhibit indicate from the record of the actual operation, an overbalance in one direction or another of trains between Yuma, and Gila, for example?

A. It does.

[fol. 3165] Q. Will you point to the figures?

A. In the first block, Yuma to Gila, the total in column J indicates 228 trains east and 251 trains west.

Q. What happened to that unbalance of 23 trains in the month of June, 1938, on the redispatch?

A. On the redispatch we were able to redistribute the business so that there were 165 trains east and 164 trains west.

Q. Are similar figures available for each of the other blocks to indicate an unbalance in actual operation, and a partial balancing or approximate balancing in redispatching?

A. That is right, and that is true. As far as Lordsburg, from Lordsburg to El Paso it appears that a balance of 216 east and 219 west, and actual between 182 east and 189 west, an excess of three became an excess of seven. Just why that was, I don't recall.

Q. Now, referring again to the first block of the exhibit, the June movement between Yuma and Gila, the 228 trains eastward, and 251 trains westward, Mr. Sines, what was done to provide locomotives and crews for the other 23 trains?

A. Locomotives were double-headed, and train crews were deadheaded in the opposite direction to provide loco-
[fol. 3166] motives and crews to handle the excess cars.

Q. Does that mean, then, that you would have to move 23 locomotives approximately from Yuma to Gila without load?

A. Yes, sir.

Q. And 23 train crews deadheading?

A. That is right.

Q. But performing no service?

A. That is right.

Q. Would the same or substantially the same result be true as to each of the other cases in column J, where an unbalance is shown?

A. Yes.

Q. Again referring to the block between Yuma and Gila, and the same appears to be the case as to the block between Gila and Tucson, and Tucson and Lordsburg in the redispatching study, Mr. Sines, I notice that your eastward trains did not in any instance exceed 120 cars, and that the greater number of them fell in the block between 91 and 100 cars, whereas your westward trains in June, of course, fell in large number in the block between 121 and 130 cars. What is the explanation for the different preponderance of train lengths eastward and westward be-
[fol. 3167] tween Yuma and Gila during June when the actual number of the redispatched trains was almost the same?

A. There was an excess of westbound empties in June. In other words, we had more empty cars moving westbound than there were loaded cars moving eastbound, and not having any restriction placed on the maximum number of cars we could handle, we took care of this excess empty westbound movement by putting more cars in the westbound trains than in the eastbound.

Q. Do I understand that these are only empties moving westbound, or does that include loads as well as empties?

A. It also includes loads.

Q. Your unbalance is as between cars both loaded and empty in one direction over the other?

A. Yes, that is right. I spoke of the excess empties westbound because it is the empty cars that show the greatest amount of fluctuation.

Q. It is the empty movement that contributes largely to the unbalance?

A. That is right.

Q. And referring to these other blocks, Gila-Tucson and Tucson-Lordsburg, and Lordsburg-El Paso, would the same explanation apply?

A. Yes.

[fol. 3168] Q. Have you any other feature of the exhibit that has not been mentioned?

A. Yes. In the territory Lordsburg to El Paso, we see evidences of the efforts of Chief Dispatcher Herrell to make two trains out of three trains at Lordsburg in the eastward operation, and, also, it is apparent that there has been splitting up of long trains at Lordsburg in westward operation. He had for the two months shown, June and August, 14 plus 15 plus 156 plus 23, or 208 of the 678 trains over seventy cars. There is a comparison that you spoke about before the exhibit was introduced, between 186 and Exhibit 214, and the quickest comparison is to be made in the percentage of trains over 70 cars. Between Sparks, Nevada, and Carlin, Nevada, we had 72.4 trains over 70 cars, between Carlin, Nevada and the Nevada-Utah line we had 88.41 trains over 70 cars, and between the Nevada-Utah line and Ogden, Utah, we had 85.86 trains over 70 cars. On our redispatching study for the months of June and August, 1938, we had 80.06 trains over 70 cars for the line Yuma to El Paso, expressed in percentages.

Q. Mr. Sines, will you refer to a chart in one sheet bearing a rather long title, "Relative Train Length, California, [fol. 3169] Arizona, New Mexico, Texas, Through and Local Freight Trains," and so forth, based on redispatching study of June and August, 1938?

A. Yes.

Q. Did you prepare this exhibit or cause it to be prepared?

A. I had it prepared.

Mr. Mason: May we have this marked "Defendant's Exhibit No. 215 for identification"?

The Clerk: Defendant's Exhibit No. 215 for identification.

Mr. Mason: From what sources was this prepared?

A. This was prepared from the actual and redispatch train sheets for the months of June and August, 1938.

Q. Now, as to the district west of Yuma, did you use those sources?

A. No, that information was taken from a statement furnished by the auditor of equipment service accounts.

Q. How was the information prepared?

A. The territories included there are the freight runs between Indio and Yuma and between the Imperial Valley and Yuma, so that the average number of cars per train [fol. 3170] is the average of the trains entering Yuma from the west and departing from Yuma to the west.

Q. Is this average a composite average of trains over both those lines which converge just west of Yuma?

A. Yes.

Q. Is it based upon the conductor's wheel reports?

A. It is, and it is determined by compiling the car-miles and then dividing by the train-miles to get the average number of cars per train-mile.

Q. This figure west of Yuma represents the number of cars per train from the aspect of the trains arriving at Yuma from the west, from as far west as Indio or the Imperial Valley?

A. Yes, sir.

Q. What do the averages for the lines styled "Actual Operation" represent as shown here?

A. They represent the average length of trains arriving at the terminals indicated for the territory Yuma to Gila, for instance, in an eastward direction, at the bottom of the sheet, the trains arriving at Gila in actual operation averaged 64.3 cars; whereas, the trains arriving at Gila on the redispatched operation——

Q. The exhibit has not been offered. But these aver- [fol. 3171] ages are the average number of cars in the train, exclusive of caboose, is that correct?

A. Yes, this is exclusive of caboose.

Q. Entering the particular terminal indicated by the vertical line; is that correct?

A. That is correct.

Q. And all of the information as to the districts east of Yuma is taken from the actual and redispatch train sheets and the white work sheets A?

A. Yes.

Q. Has the exhibit been checked against the underlying sources?

A. It has.

Q. And as to the records shown in compiling the average west of Yuma, are those records available?

A. I have the statements furnished by the auditor of equipment service accounts, and I can get the conductors' wheel reports for that territory, if they should be required.

Mr. Mason: Will you need that, Mr. Strouss, for the territory west of Yuma?

Mr. Strouss: The conductors' wheel reports? No. West of where?

The Witness: Yuma.

[fol. 3172] Mr. Mason: The California portion of the sheet.

Mr. Strouss: No.

Mr. Mason: Have you any questions on the exhibit, Mr. Strouss?

Mr. Strouss: No, I have no questions.

Mr. Mason: I don't think you have explained, Mr. Sines, but do I understand that the top half of the chart above the line across the exhibit, which is designated by the zero, represents the average length, actual or redispatched, as the case may be, of westward trains?

A. That is right.

Q. Is that entirely separate from the showing on the lower half of the chart representing the lengths of the eastward trains?

A. That is right.

Q. What is the purpose or significance of the cross-hatching?

A. By means of the area that is cross-hatched on this chart, we have visual evidence of the effect of the Arizona Train Limit law in limiting the length of freight trains.

Mr. Mason: We offer the exhibit in evidence as defendant's Exhibit No. 215.

Mr. Strouss: The same objection as to the previous ex-[fol. 3173] hibit.

The Court: The objection is overruled. It may be admitted in evidence.

(Thereupon the document referred to was received in evidence and marked, "Defendant's Exhibit No. 215.")

Mr. Mason: Now, Mr. Sines, do I understand from the exhibit that the average length of trains entering Lords-

burg, rather entering El Paso from the west over the Lordsburg-El Paso line, is at present 68 cars?

A. Yes.

Q. And that the average length westward entering Lordsburg is 65.2 cars?

A. That is right.

Q. I notice also that you show in actual operation between Yuma and Lordsburg average lengths of 63, 64, and 65 cars, approximately, in the various districts?

A. Yes, sir.

Q. Although the law permits 70 cars. Will you explain why the average as computed by you in actual operation does not attain more closely to 70 cars?

A. There are two reasons, there are two very important reasons. The first one is that it is not always possible to [fol. 3174] put 70 cars in every train, the traffic simply isn't there. That is particularly true with the last train leaving Yuma at the end of the day's business, at the end of the day's business as it is received from California, and furthermore,——

Q. Mr. Sines, you say that the number of cars in the day's business at Yuma will not be an exact multiple of 70, is that the idea?

A. That is the idea.

Q. Why can't you leave those 40 or 50 cars which may be the odd cars and wait until you have an exact multiple of 70?

A. Because those cars with perishables in them are moving on schedule and are due in Chicago or some other eastern destination on a certain day, and cannot be left over at Yuma for any length of time. The local trains also have difficulty, probably very seldom, if ever, reach 70 cars in length. Those are the trains that pick up and set out and do local work along the road. We don't have any assigned locals in this territory, but occasionally trains will run each day doing more local work than others; a train leaving Yuma, knowing that he is going to pick up cars at Wellton, will leave Yuma with enough space under seventy [fol. 3175] to permit him to pick up to 70 cars at Wellton, then if he sets out some cars short of Gila he will have to run into Gila with a consist of less than 70 cars. The result of that operation is that the average length of the train for the entire run from Yuma to Gila may be considerably

less than 70 cars. This applies, of course, to all districts between Yuma and Lordsburg, and Yuma to Rodeo. The other important factor is the length of sidings as they exist today in Arizona. Originally, as shown by the exhibit which I have just introduced, Exhibit 213, we had a complement of sidings which were capable of, with few exceptions, of holding trains consisting of 70 cars and engine and caboose, but the engines and the cars got longer and the result is that today we cannot crowd 70 cars into all of these sidings. On the other hand that does not limit us necessarily to operating only 66 cars in both directions, we can still operate up to 70 cars in one direction on trains and run short siding clearance length trains in the other direction to permit these trains to pass. Another consideration is that it is not always necessary that all of the trains in the same direction be of 70 cars. By timing the departures from terminals, it is possible to run trains of [fol. 3176] up to 70 cars in each direction within the same twenty-four hour period. This can be done also by taking advantage of the few long sidings which we do have today in Arizona. The result of all of this is that instead of having an average more closely approaching seventy cars, we get down to the averages shown on my exhibit 215, but when it comes to seventy cars, the Southern Pacific Company has never felt justified in spending the hundreds of thousands of dollars that would be necessary to give them a complete line all the way across Arizona of sidings which would be capable of holding more than seventy cars.

The Court: This hearing will be recessed until tomorrow morning at ten o'clock.

(Thereupon the court stood at recess until January 29, 1941, at ten o'clock, A.M.)

[fol. 3177] January 29, 1941, ten o'clock A. M.

Proceedings were resumed at this time as follows:

Mr. Mason: Your Honor, Mr. Masson is here and has some further additional information in the shape of exhibits which were suggested at the time of his prior appearance, and if there is no objection I would like to inter-

rupt the course of Mr. Sines' testimony to put Mr. Masson on for that purpose and for any additional questions which Mr. Strouss may have.

The Court: If there is no objection, that may be done.

L. J. Masson was recalled to the stand and testified further as follows:

Redirect examination.

By Mr. Mason:

Q. Mr. Masson, at page 2317 of the transcript, with reference to Exhibit 166, it was suggested by Mr. Strouss that you give more of the detail of the cars and tonnage for the System and for the three states, Arizona, New Mexico and Nevada, in accordance with the major sub- [fol. 3178] divisions which the commissions recognize in the annual reports rendered to them. I will ask you now if you have prepared from the annual report of the company to the Interstate Commerce Commission for the year ended December 31, 1939, a showing of schedule 541, revenue freight carried during the year, showing the total of tons and cars by commodities and by classifications of commodities?

A. Yes. This exhibit is a photostatic copy of schedule 541 as it appears in the annual report to the Commission, except as to the heading, "Southern Pacific Company, Pacific Lines," and the legend which appears at the upper righthand corner.

Q. This is an exhibit of four sheets, the first sheet showing a photographic reproduction of printing "541. Revenue Freight Carried During the Year."

A. Yes, sir.

Mr. Mason: May we have this exhibit marked No. 216?

The Court: It may be marked.

The Clerk: Defendant's Exhibit No. 216 for identification.

Mr. Mason: Now, is Exhibit 216 an exact photographic reproduction of these particular pages of the annual re- [fol. 3179] port which are identified by number from 512 to 519?

A. Yes, except as I have stated.

Q. The identifying material at the top of the sheet has been added by typewriting before photographing?

A. Yes.

A. And being a photograph, it is an exact reproduction except as to size?

A. Yes.

Mr. Mason: Have you any questions on the exhibit, Mr. Strouss?

Mr. Strouss: No.

Mr. Mason: We offer it as defendant's Exhibit No. 216.

Mr. Strouss: No objection.

The Court: It may be admitted.

(Thereupon, the document referred to was received in evidence and marked "Defendant's Exhibit No. 216.")

Mr. Mason: In connection with the same subject matter, Mr. Masson, have you an exhibit in two sheets bearing the style in typewriting, "Southern Pacific Company, Pacific Lines, State of Arizona," and then showing on the first sheet schedule 941, revenue freight carried during the year?

[fol. 3180] A. Yes.

Mr. Mason: May we have this exhibit marked No. 217?

The Court: It may be marked.

The Clerk: Defendant's Exhibit No. 217 for identification.

Mr. Mason: Is this exhibit a photograph of pages 908, 909, 910, and 911 of the annual report for the year 1939, rendered to the Corporation Commission of the State of Arizona?

A. This is a typed transcript of the figures as they appear in the report to the Corporation Commission of Arizona on a form that corresponds to Schedule 941, which was subsequently photostated.

Q. Then these figures appearing here in typewriting, apart from the printed matter which appears in the photostat, are a typewritten transcript of figures rendered to that commission?

A. Yes.

Q. Why did you prepare this in typewriting?

A. Because our office copies are in manuscript.

Q. Has this exhibit been checked against the office copy of the annual report?

A. Yes.

Q. Will you state whether it is true and correct?

[fol. 3181] A. To the best of my knowledge and belief it is, yes, sir.

Q. Do I understand that this contains the information for the State of Arizona corresponding substantially to the information for the System as reported to the Interstate Commerce Commission, and shown on Exhibit 216?

A. Yes, sir.

Mr. Mason: Have you any questions, Mr. Strouss?

Mr. Strouss: No.

Mr. Mason: We offer the exhibit as defendant's Exhibit No. 217.

Mr. Strouss: No objection.

The Court: It may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 217.")

[fol. 3182] Mr. Mason:

Q. Mr. Masson, have you prepared an exhibit similar to No. 217 from the annual report rendered to the state commission of New Mexico for the year 1939?

A. Yes, sir.

Q. Was this exhibit prepared in the same way?

A. It was prepared in the same way, the figures that appear in the schedule of the report to the state corporation of the state of New Mexico for the year 1939.

Mr. Mason: May we have this statement marked No. 218 for identification?

The Court: It may be marked.

The Clerk: Defendant's exhibit No. 218 for identification.

Mr. Mason:

Q. I take it that exhibit No. 218 is in exactly the same form as exhibit No. 217 but relates to the state of New Mexico?

A. That is true.

Q. Has it been compared?

A. Yes, sir, and it is correct to the best of my knowledge and belief.

Mr. Mason: We offer the exhibit in evidence as defendant's exhibit No. 218.

Mr. Strouss: No objection.

The Court: It may be admitted.

[fol. 3183] (The document referred to was received in evidence and marked "Defendant's Exhibit No. 218.")

Mr. Mason:

Q. Have you a similar exhibit in two sheets relating to the state of Nevada and purporting to be a reproduction of pages 908 to 911, inclusive, of the annual report to the Nevada Public Service Commission?

A. Yes, sir.

Mr. Mason: May we have this marked "Defendant's Exhibit No. 219"?

The Court: It may be marked.

The Clerk: Defendant's exhibit No. 219 for identification.

Mr. Mason:

Q. Was exhibit No. 219 for identification prepared in the same way as the preceding exhibits Nos. 217 and 218?

A. Yes, sir.

Q. Has it been compared?

A. Yes, sir, and it is correct to the best of my knowledge and belief.

Q. It relates to the same subject matter but as set forth in the report to the Nevada Commission?

A. As set forth in the report to the Public Service Commission of Nevada for the year 1939.

Q. Are these forms of reports as rendered to the states [fol. 3184] insofar as concern schedule 941 identical or substantially so?

A. Yes, they are identical.

Mr. Mason: Have you any questions, Mr. Strouss?

Mr. Strouss: No.

Mr. Mason: We offer the exhibit in evidence as defendant's exhibit No. 219.

Mr. Strouss: No objection.

The Court: It may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 219.")

Mr. Mason:

Q. Mr. Masson, in connection with your exhibit No. 173, at page 2290 of the transcript, you stated as to item 18 there were no amortization charges included in the item. I will ask you if you have made a subsequent investigation to determine whether any such charges have been included in that item for any of the years represented on exhibit No. 173?

A. At the time of my answer I had before me the figures for 1939, in which year there were no amortization charges, but I overlooked the fact that there are charges for amortization of discount on funded debt in all of the years 1925 to 1938, inclusive.

[fol. 3185] Mr. Mason: May we have the understanding that the statement in the record at page 2290 may be considered corrected accordingly?

Mr. Strouss: Yes.

The Court: It is so ordered.

Mr. Mason:

Q. There was one other matter to which inquiry was made in connection with your exhibit No. 162. You were asked to give some breakdown of the mileage, I believe?

A. Mr. Strouss asked for a breakdown of the mileage for 1939, as I recall it, as between main line and branches on exhibit No. 162. That breakdown is as follows: main line, 5,129 miles; branch lines, 3,430 miles, which comes to the total of 8,559 miles as shown in the exhibit. That, I believe, completes all of the data you asked for.

Mr. Strouss: Yes, I believe so.

Mr. Mason: Have you any questions of Mr. Masson?

Mr. Strouss: No, I have nothing further to ask him.

Mr. Mason: Do you wish Mr. Masson to return at a later date for cross-examination?

Mr. Strouss: I don't believe so. I have gone over his testimony and I don't know of anything I wish to ask him about further.

[fol. 3186] Mr. Mason: Unless you find something, we will consider Mr. Masson is excused?

Mr. Strouss: Yes.

The Court: You may step aside.

(Witness excused.)

B. S. Sines resumed the witness stand for further

Direct examination.

By Mr. Mason:

Q. Mr. Sines, have you before you an exhibit consisting of a chart of a single sheet entitled, "Southern Pacific Company, Yuma, Arizona, to El Paso, Texas, June 18th, 1938, Train Movements"?

A. I have.

Mr. Mason: Your Honor, we ask that this chart be marked "Defendant's Exhibit No. 220" for identification.

The Court: It may be marked.

The Clerk: Defendant's exhibit No. 220 for identification.

Mr. Mason:

Q. Did you prepare exhibit No. 220 for identification or supervise its preparation?

A. It was prepared under my direction and I supervised it.

[fol. 3187] Q. The chart appears to be divided into two portions and I will ask you if the two are separate and distinct charts?

A. They are.

Q. Addressing yourself to the chart at the left side of the sheet which is headed "Actual," from what source was that prepared?

A. That was prepared from the actual train sheets reflecting the movement of trains on June 18, 1938, between Yuma, Arizona, and El Paso, Texas.

Q. Were the conductors' time returns and delay reports used in connection with the preparation of the chart?

A. They were.

Q. Is the showing on the chart headed "Actual" restricted to a particular route between Yuma and El Paso?

A. Yes, to the route via Gila and Bowie.

Q. From what source was the portion of the chart headed "Redispatched" prepared?

A. From the redispatched train sheets for the same date.

Q. Were the conductors' delay reports employed in connection with its preparation?

A. Only indirectly insofar as the conductors' delay reports were used to govern the movement of the redispatched [fol. 3188] trains, as I have previously described.

Q. The date referred to is June 18, 1938. Has that date any particular significance?

A. That is the day of maximum traffic during the month of June, 1938, between Yuma and El Paso.

Q. You mean maximum traffic with respect to train movement?

A. With respect to the number of trains operated.

Q. Would that also be the maximum number of cars moved between the points?

A. That would be a fair guess, although I didn't check the cars handled.

Q. Was that also the day on which the largest number of redispatched trains were operated or did you check as to that?

A. No, the check refers to the movement that occurred actually on June 18th.

Q. Going to the detail of the charts themselves, and referring for this purpose to the actual chart, I take it that the two charts are in a sense counterparts of each other?

A. They are; they are made out to the same time and distance scales.

Q. What is the significance of the figures under the word [fol. 3189] "Actual" and immediately at the top of the actual chart?

A. They represent the twenty-four hours of the day, June 18th, starting with twelve midnight and ending with twelve midnight.

Q. Are the hours plotted to scale horizontally across the chart?

A. They are.

Q. That is to say, the width of the chart is divided into twenty-four equal spaces?

A. Twenty-four equal spaces, yes.

Q. Those are the hours as designated by the figures A.M. and P.M., I take it?

A. Right.

Q. Proceeding down the chart and without reference first of all to the angling lines, what do the horizontal lines along the chart indicate?

A. They represent the station locations according to the names indicated at the left and right-hand sides of the chart.

[fol. 3190] Q. Are the distances between stations according to scale?

A. Yes, according to the miles between the stations.

Q. It appears, for example, that between Granite Spur and Ligurta is a considerably less space than between Ligurta and Wellton. Is that in accordance with the mileage between those points?

A. It is.

Q. Now, you show certain points or certain lines on the chart somewhat heavier than others. For example, I notice a heavy line at Gila and also a larger size of lettering used in designating Gila. Was there any particular reason for that?

A. Yes, we indicated the terminals with a heavier line and with larger sized printing.

Q. Then that particular designation applies also to Tucson, and Lordsburg, does it?

A. That is right.

Q. What is the significance of the cross-hatching that appears for example, between Yuma and East Yard, between Dome and Wellton, and between Stockham and Mescal?

A. The cross-hatching indicates the location of double track.

[fol. 3191] Q. Where there is no cross-hatching, what is the character of the operation?

A. Single track.

Q. I notice that in the double-track territory, between Stockham and Mescal, that the names of the stations on the lefthand side of the chart are not in all cases the same as the names of stations on the righthand side of the chart. Why is that?

A. That is because the location of the stations on the two tracks do not always coincide in the mileage distances from some given point, and is brought about because of the divergence of the tracks.

Q. Is that the district between Tucson and Mescal where the eastward and westward tracks are not on the same grade at all points?

A. Yes, and as I recall the distance, by the eastbound track is a mile or two longer than by the westbound track.

That difference in mileage is accounted for by shrinking or expanding the westbound track each time to conform to the eastbound mileage schedule. It would be impossible to draw the map, to draw this chart, and have exact scales in each direction, so we assumed that the eastbound scale is the governing scale.

Q. Does that have any substantial effect upon the chart [fol. 3192] itself?

A. It has very little effect; well, none at all on the information that the chart portrays.

Q. Now, what is the significance of the black lines which move across the chart, extend across the chart in a more or less diagonal fashion?

A. Those lines represent the progress of individual trains according to the time and distance scales upon which the charts are laid out.

Q. And are those trains identified in any manner on the charts?

A. Yes; those trains are identified with sufficient frequency so that a train may be traced from its first appearance on the chart to its final appearance on the chart.

Q. I notice that some of these lines sloping from the left to the right as one goes down the chart; that, practically all of them cross other lines from the left to the right as one goes up the chart. What do those intersections indicate?

A. If those intersections occur on single track, it means that the trains have met and passed in opposite directions.

Q. Do you indicate the meets by some particular method on the chart?

A. Yes, we drew circles around those meets in order the [fol. 3193] more easily to identify and count them.

Q. Now, if the lines intersect in a double track section, what does that mean?

A. Well, that means that the trains met, but that there was no interference between the trains, being on double track.

Q. They simply went by each other on opposite tracks?

A. Yes.

Q. I notice, also, that a sloped line changes its course frequently, that these sloping lines may come to the line indicating a station and then there will be a bend or elbow in the line?

A. Yes.

Q. The line, that is to say, extends to the right along the station line instead of continuing its course. What does that indicate?

A. It indicates that the train has stopped at that station for one reason or another, and the length of the elbow measured on the time scale indicates the length of time that the train was at the station.

Q. It appears that some of these circles which you have stated indicated meets have figures such as a 2 or 3 opposite them. What do those indicate?

A. When figures occur alongside of the circles it indicates [fol. 3194] the number of meets that have occurred between trains, for instance, a train in one direction may go into the siding and be passed by two trains running in the opposite direction. In that event we counted that as two meets, and the figure "2" alongside is also to assist in identifying and counting the meets.

Q. Now, some of these lines which you state indicated progress of trains are solid and others are dashed. What is the significance of that?

A. The long dash indicates passenger trains running on this particular day.

Q. Are they identified by their numbers?

A. They are.

Q. And what do the dotted lines indicate?

A. The dotted lines indicate movement of helpers and light engines without trains.

Q. Now, lines which start on the lefthand side of the chart and slope to the right and downward indicate movement in what direction?

A. Eastward, generally from Yuma toward El Paso.

Q. How do you indicate westward movement?

A. By a line beginning at the lower left and progressing toward the upper right.

Q. Suppose that a train at midnight is at or near an [fol. 3195] intermediate station between Yuma and El Paso such as Gila, for example, how do you indicate that? Where does its line start?

A. If it be the midnight between June 17th and 18th, the line will start at that station and the further progress of the train will then be indicated by the manner in which the line is drawn. If it be the midnight between June 18th and 19th, the train is shown passing off of the chart at the

particular location, or near the particular location that it happened to be at midnight.

Q. Now, has this exhibit been checked against the dispatchers' train sheets and the time returns and daily reports?

A. Several times.

Q. Was the chart showing the movement of redispatched trains prepared in the same way and along the same lines as the chart depicting actual movements?

A. Yes, sir.

Q. The description which you have given of the chart as to actual applies likewise to the redispatched?

A. That is right.

Q. Now, I notice at the foot of the sheet there is a tabula- [fol. 3196] tion as well as a legend. Where do you get those figures?

A. Those figures can be checked by making a count of the particular items indicated directly above.

Q. That is, you can count the number of actual trains by just counting the number of lines eastward or westward, can you?

A. Yes.

Q. The same way as to the redispatch?

A. Yes.

Q. And you can find the number of meets by taking the number of circles and figures of meets shown on the chart and adding them up?

A. That is right. That explanation is true as to meets and passes, but a further explanation should be made with respect to the count for the number of trains. In making that count, we found it was necessary to establish an arbitrary rule and we counted those trains which left any terminal within the 24-hour period. Fractional trains that started at midnight at some intermediate station, we did not count.

Q. Unless they left a terminal during the twenty-four hours?

A. That is right.

[fol. 3197] Q. Then a train which came on the chart, let us say, at Wellton at or near midnight and went only to Yuma before going off the chart, would not be counted as a train?

A. No.

Q. But if it left Gila at or near midnight and went on to Yuma, it would be counted?

A. Yes.

Q. And the same way, if a train came on the chart moving eastward at a point between Lordsburg and El Paso, it wouldn't be counted as a train because it didn't leave Lordsburg within the 24 hours?

A. That is right.

Q. I notice that some of these circles, according to the legend at the foot of the chart, instead of being in solid line are in dashed line.

A. Yes.

Q. What does that signify?

A. That signifies a pass.

Q. How do you define a pass as distinguished from a meet?

A. A pass occurs when a train overtakes a train going in the same direction and passes it, goes by the preceding train.

Q. Does that happen, for example, when a passenger [fol. 3198] train overtakes a freight train in the same direction on single track and runs around the freight train?

A. That is right. That can happen on both single and double track.

Q. Meets normally occur only in single-track territory?

A. Yes, sir.

Q. Whereas, passes may occur in either?

A. Both single and double line track.

The Court: Mr. Sines, referring to that exhibit under the actual operations, see if I follow the chart: take for instance the progress of the train designated C-4-13 in the upper lefthand corner. Now, that train left Yuma near midnight of June 17th-18th, and proceeded on its eastward course, but only reached during that 24-hour period the division point at Lordsburg, when we lose track of it; is that correct?

A. That is correct, although apparently that is C-413 leaving Lordsburg at approximately 11:30 and passing off the chart between Elmoris and Lisbon. You will notice that the preceding train leaving Lordsburg is CY412 and west of Lordsburg the preceding train was also CY412.

The Court: Now, taking a passenger train, for instance [fol. 3199] No. 6, that left Yuma between four and five

A. M., it reached El Paso, Texas, at eight P. M. that evening?

A. That is right.

Mr. Mason: What is the purpose of the charts shown here, on Exhibit 220 for identification?

A. There are two primary purposes. The first is to give visual evidence of the difference in operation between operations under the 70-car limit, the actual, and under unrestricted operation, the redispatch. Just by a glance of the eye it is possible to obtain an appreciation of the reduction in the number of trains possible with an unrestricted operation. The second purpose is to demonstrate the reduction in interference occurring as a result of the reduction in the number of trains operated. The second purpose is largely the reason for the tabulation appearing at the bottom of the sheet where the number of trains and the number of meets and passes establish a relationship which I develop later to make an estimate of what would occur during the year 1938 under an unrestricted operation.

Mr. Mason: Have you any questions on this exhibit, Mr. Strouss, at this time?

Mr. Strouss: No; not at this time.

[fol. 3200] Mr. Mason: Your Honor, there are certain other explanations that could be made with profit on the exhibit, but would involve some of its details. I prefer to ask them after the exhibit has been received in evidence, if it is received. I offer the exhibit in evidence as Defendant's Exhibit No. 220.

Mr. Strouss: The same objections to this exhibit as were made to Exhibits 198 and 214 and 215, particularly as to the redispatch part of the exhibit.

The Court: The objection is overruled. It may be admitted in evidence.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 220.")

[fol. 3201] By Mr. Mason:

Q. Mr. Sines, I wish you would take some particular train on the exhibit and indicate its progress. Take, for example, C-413 in actual operation. That train apparently left Yuma somewhat before midnight of June 17th; you first see it at East Yard, is that correct?

A. That is right. That train probably left Yuma about eleven-thirty or sometime around eleven-thirty and, arriving at East Yard at the end of the double track, it met a westbound train DF-3627, meaning "dead freight with engine 3627." We counted that as a meet because inspection of the train sheet and conductor's delay report indicated that the progress of 413 had been delayed a little by the DF-3627 leaving the single track and going on the double track.

Q. Does that mean that C-413 waited at the end of double track for the other to clear?

A. Yes. 413 then progressed to Araby and went into the siding to meet passenger train 43; went to Fortuna and went into the siding to meet train No. 5. He then proceeded to Gael and the little jog to the right is an inspection stop. He then proceeded to Mohawk and went by dead freight 3625, which had gone into the siding at Mohawk. C-413 was not delayed by that meet. C-413 then proceeded [fol. 3202] to Stanwix where C-413 went into the siding and trains SSW First and Second 17 consolidated with GBW-16 passed, followed immediately by SSW Third 17. C-413 departed from Stanwix after SSW Third 17 had gone by and doubled from Lava to Sentinel. The double is indicated by the jog to the right and by the amount of time consumed by the train in going from Stanwix to Sentinel. At Sentinel he met DF-3321 which was waiting for him but which did not delay C-413 and then went to Tart on where he met DF-3612, again not being delayed by DF-3612. He had another meet with DF-3638 at Smurr. There was no delay to C-413 at Smurr either. Then approaching Gila the conductor's delay report showed that the train had flagged a block into Gila and that is the reason for the slow progress being indicated by the less steep slope of the line beginning halfway between Smurr and Gila.

Q. You say he flagged a block, what do you mean?

A. It means that approaching Gila yard he found the block signals at "Stop," and sent a flagman ahead to walk in advance of the engine and flag the train into the station at Gila.

Q. He had to wait, did he, before he could pass the block with the signal in "Stop" position?

[fol. 3203] A. Yes, the flagman has to go out there a safe distance ahead, I think it is something like half a mile or a mile that the flagman has to go out ahead of the train

in order to properly protect his train. C-413 arrived at Gila at approximately 6:15. He was in Gila about thirty-five minutes, departing at 6:50 and proceeded to Estrella. At Gila he picked up a helper, the helper being cut off at Estrella and returning to Gila. The return of the helper from Estrella to Gila is indicated by the short dashed line leaving Estrella almost immediately after the departure of train C-413. C-413 progressed to Mobile and went into the siding to permit passenger train No. 6 to pass him. He then went to Enid where DF-3660 was already in the siding, having met passenger train No. 6. C-413 went past Enid without delay and progressed to Maricopa where there is a stop indicated, that is a water stop as I remember, or he might have been there for switching. He then progressed to Casa Grande where he met DF-3636 without being delayed and progressed to Picacho where there was a delay for one reason or another which I don't remember. He went on to Rillito where he stopped again for five or ten minutes and then progressed to Cortaro where he met DF-3615 without being delayed inasmuch as DF-3615 had [fol. 3204] gone into the siding. He then progressed to Tucson, arriving at Tucson at approximately 12:35. As he was entering the Tucson yard and between the end of double track at Stockham and the yard at Tucson he met DF-3617 departing from Tucson. C-413 departed from Tucson at approximately 1:40—I want to explain that these times are approximate as I read them off this scale.

Q. They are actually shown, I take it, on the train sheets and the time returns and delay reports?

A. Yes, that is right. He went to Mescal without stopping. He stopped at Mescal probably for an inspection, went to Chaniso where he met DF-5021, DF-5021 having taken siding, and then C-413 went to Benson where he met two passenger trains, first 43 and second 43; C-413 taking the siding. Leaving Benson he went into the siding at Curvo for merchandise train 5026 and also took siding at Sibyl for SSW First 18 and GBW-17. Then he went to Dragoon and took siding for SSW Second 18 and apparently waited there also for DF-5037. There is no indication on this chart as having had a helper from Tucson to Dragoon, but I would say that he did have one because [fol. 3205] he had a helper between San Simon and Steins.

Q. If he had a helper, it is possible that the helper engine may have been attached as a double-header to one of the westward returning trains?

A. Yes, that would have occurred at Dragoon and the presence of the helper would not have been disclosed.

Q. Because it would not be a separate movement?

A. That is right.

Mr. Strouss: I think the testimony of what probably was there should be stricken.

The Court: Yes, it may be stricken.

By Mr. Mason:

Q. In any event, whether or not a helper was used will be revealed by the train sheets?

A. That is right.

Q. And the movement of the helper, if it was double-headed, is likewise indicated by the train sheets?

A. That is right. He progressed to Willcox where a delay of five or ten minutes is indicated and then went to Bowie where he was delayed ten minutes and also met DF-3742. At San Simon he stopped for a helper and went to Steins where the helper was cut off, the return of the helper being indicated by the short dashed line, and then [fol. 3206] progressed to Pyra where he met DF-5014 without being delayed and reached Lordsburg at approximately 10:45. He departed from Lordsburg about 11:35 and passes off the chart between Ulmoris and Lisbon at midnight.

Q. You point out in the progress of this train various places at which he took siding either for passenger trains or for freight trains. When a train goes into a siding to wait for a passenger train or another freight train which it is to meet or which is to pass it, who throws the switch which permits it to enter the siding?

A. The head brakeman of the train entering the siding.

Q. When the train pulls out of the station after the meet or pass has been accomplished, is the switch again lined up for the main line?

A. Yes, by the rear brakeman of the train leaving the siding.

Q. After a train has taken siding and while it is waiting, is the switch which it has used to enter that siding lined up for the main line?

A. Yes, the rear brakeman of the train taking siding does that also.

Q. When the train leaves the siding to return to the main [fol. 3207] line, does the head brakeman throw the switch for it?

A. That is right.

Q. Can these switches be thrown by these brakemen while they remain on the train or must they get off the train for that purpose?

A. They have to get off the trains to do that.

Q. Do they get off the trains while the trains are moving?

A. Yes.

Q. And climb on the trains again after the trains have started?

A. That is right.

Q. With reference to the actual chart again, I notice that some of these lines, for example, the line indicating the movement of train No. 901 at the top of the chart extends only from Wellton to Yuma. What does that indicate?

A. 901 is the Phoenix line local coming on to the Yuma-Gila line at Wellton and moving from Wellton into Yuma on the Yuma-Gila line.

Q. I notice that there are certain lines down toward the center of the chart which appear to begin at Picacho and extend only between Picacho and Tucson or from Picacho eastward. Is there a similar explanation in their case?

A. Yes, those are the trains operating between Tucson [fol. 3208] and Phoenix which use the line from Picacho into Tucson.

Q. For example, passenger train No. 2 apparently has no progress west of Picacho on the chart but is shown as extending from Picacho eastward?

A. That is right.

The Court: We will take our morning recess at this time.

(Thereupon a short recess was taken, after which proceedings were resumed as follows.)

Mr. Mason:

Q. Mr. Sines, I will ask you whether the incidental delays which occurred to individual trains in actual operation are indicated on the diagram of the actual showing here,

for example, those due to flagging of blocks or engine failure or whatever may have happened?

A. That is right.

Q. Are those incidental delays indicated on the redispatched chart as having been assigned to a particular train or group of trains about the same time and in the same locality?

A. They are.

Q. That is the method pursued by you throughout the redispatch?

A. That is right.

Q. This is a sample of the method pursued throughout [fol. 3209] the redispatch?

A. Exactly.

Q. I take it also that, generally speaking, the freight trains operated on the redispatch side of the chart had more cars per train than those on the actual side?

A. That is right.

Q. And the length of those trains is shown by the underlying documents, the train sheets and the white work sheets A which have been furnished to Mr. Strouss and are now in his possession?

A. That is right.

Q. Is it possible from this chart to count the number of trains in the district, for example, between Yuma and Gila?

A. Yes.

Q. Have you made that count?

A. Yes, I have.

Q. How many trains are shown on the actual here as operated between Yuma and Gila in both directions during the twenty-four-hour period?

A. Counting them in the same manner that we counted them for the tabulation at the bottom, we have ten trains eastbound.

Q. Are you counting freight trains only?

A. No, I counted passenger trains also, thirteen trains [fol. 3210] westbound in the actual operation. I should make this observation, too. A moment ago I mentioned that we made an arbitrary rule to follow in counting these trains and I described how we confined that count to trains only leaving terminals between midnight and midnight. With respect to these trains that operated to Phoenix and which appear at Wellton and again at Picacho and which

operated through Douglas and which appear at Mescal and Anapra, we eliminated those trains also; so that we have in our count only those trains operated on the main line between Yuma and El Paso via Bowie and Gila and departing from terminals between midnight and midnight. The count that I just made between Yuma and Gila was made in that manner.

Q. And does not include the trains between Yuma and Wellton at all if they operated only that distance?

A. No.

Q. I take it that your total includes passenger trains as well as freight trains both on the exhibit itself and as stated by you for the Yuma-Gila district?

A. Yes.

Q. Counted in the same manner?

[fol. 3211] A. Yes.

Q. How many meets and passes were made in actual operation between Yuma and Gila?

A. In actual operation I make it forty-three meets and passes between Yuma but not including meets indicated at Gila.

Q. That is giving to each meet or pass its value as indicated by the adjoining figure or the value of one if no figure is shown?

A. Yes.

[fol. 3212] Q. Now, will you count the number of trains operated between Yuma and Gila as shown by the redispatch chart?

A. Eight trains eastward. Seven trains westward.

Q. And how many meets and passes between Yuma and Gila in redispatched operations?

A. Eighteen.

Q. Counted in the same manner?

A. Yes. I would like to check this at my leisure and would like to correct the record if I have made any errors.

Mr. Mason: Have you any questions on the exhibit, Mr. Strouss, before we pass to the next one?

Mr. Strouss: Not at this time.

Mr. Mason: Mr. Sines, I will ask you to refer to an exhibit in two sheets, entitled "Year 1938, Yuma, Arizona,

to El Paso, Texas, via Gila and Lordsburg, Estimated Number of Meets and Passes Eliminated by Long Train Operation."

A. Yes.

Mr. Mason: May this exhibit be marked Exhibit 221 for identification.

The Court: It may be marked.

The Clerk: Defendant's Exhibit No. 221 for identifica-
[fol. 3213] tion.

Mr. Mason: Did you prepare Exhibit No. 221 for identification, Mr. Sines?

A. It was prepared under my direction and I have checked it, and it is correct.

Q. Now, from what sources did you take the information shown on the first sheet in the block headed "Actual?"

A. That is taken from the actual train sheets and the count of trains in columns A and B is made in the same manner as the count which I have previously described with Exhibit 220.

Q. And where do you get the figures in column D under the heading "Actual?"

A. That comes from the sheet 2 of this exhibit and are figures read off of the chart.

Q. Then, in order to get the showing on sheet 1, you first must go to the showing on sheet 2, is that correct?

A. Yes.

Q. Will you then explain what you have done on sheet 2?

A. Yes. The first thing we did was to make a count of trains and meets and passes in a manner exactly similar to that which I have just described in connection with Exhibit
[fol. 3214] 220 for the days indicated on the chart, those days being August 17, August first, June first, June second, June twenty-third, June fourteenth and June eighteenth, 1938. The number of trains operated those days are indicated at the top of sheet 2, and the number of meets and passes are shown alongside.

Q. Is this based upon the actual trains operated?

A. Yes, that count is from the actual train sheets in all instances, rather, that data is taken from the actual train sheet in all instances.

Q. Do I understand then you took the actual train sheet for the dates in 1938 which are indicated on sheet 2 and counted from the train sheets the number of trains in ac-

cordance with the method that you used and explained on Exhibit 220?

A. Yes.

Q. And also counted the number of meets and passes made by these trains in the district between Yuma and El Paso via Gila and Lordsburg?

A. Yes.

Q. And then plotted the points indicated by the dates to scale on this scale, is that correct?

A. That is right.

Q. Now, what does the figure at the top of sheet 2 "41" [fol. 3215] indicate? Is that the number of trains on August first?

A. That is August 17th, directly above the point August 17th.

Q. And that is plotted according to the scale at the foot of the sheet, is it?

A. Yes.

Q. Then what does the figure "74" indicate?

A. The number of meets and passes which occurred on August 17th.

Q. As represented by the actual train sheets?

A. Yes.

Q. That is plotted according to scale on the righthand side of the sheet?

A. That is right.

Q. Then, each of these other figures or pair of figures at the top of the sheet may be read down to its corresponding date, is that correct, to a plotted point?

A. That is right.

Q. Then, having plotted these points on a scale of this kind, what was the next step?

A. We then computed the probable path of a line drawn through or near those points and determined the equation of the line which is indicated in the block in the middle of the chart.

Q. Is the plotting of the equation of the line, having given [fol. 3216] a sufficient number of points to determine its course, a common and ordinary problem in analytical geometry?

A. Yes, sir.

Q. And is that the problem which you undertook to solve here?

A. That is right.

Q. And did you obtain the equation which would obtain the course of this line?

A. That is right, the equation.

Q. Will you read the equation, please?

A. The equation indicated in the center of the chart reading "M equals 0.042946 T to the 1.925 power," where M equals the number of meets and there should be added "and passes", and T equals the number of trains.

Q. Now, what use can you make of this curve as determining the number of meets and passes which will occur on the district between Yuma and El Paso via Gila and Lordsburg?

A. By means of this curve and given the number of trains operated on any particular day, it is possible to determine quite accurately in the average aspect the number of meets and passes which will probably occur.

Q. Now, what use did you make of the curve and the [fol. 3217] equation on sheet 2 then in plotting and making the showing on sheet 1?

A. We then proceeded to count the number of freight and passenger trains which had actually been operated between Yuma and El Paso on the first and fifteenth day of each of the twelve months of 1938. The results of that count are shown in columns A, B and C.

Q. And then how did you compute the figures in column D?

A. Then, taking the total shown in column C we go into the chart on sheet 2 and above the number of trains indicated in column C we find the point where the line crosses that number of trains and then go to the right to read the probable number of meets and passes.

Q. For example, to get the figure for January first, you plot the point at which the total number of trains falls on the scale of number of trains?

A. Yes.

Q. And then read the point at which the curve for the number of trains corresponds with that shown for January first across the scale of the number of meets and passes?

A. Yes, sir.

[fol. 3218] Q. Did you do that for each of the other 23 days shown for 1938 on sheet 1?

A. We did.

Q. How do you get the figure shown in column E for each of these days?

A. Column E is the figure in column A reduced by the percentage indicated at the head of the column.

Q. Where do you get the percentage indicated at the head of the column?

A. That comes from the block at the foot of the sheet and is derived from the number of trains actually operated and the number of trains operated on the redispatch in those four territories for the month of June and August, 1938. There is a blank showing for the exhibit, and I rearranged the order of my exhibits the other day, and I now find that the exhibit indicated is going to follow Exhibit 221 instead of preceding Exhibit 221.

Q. Your exhibit No. 214 contains the showing as to some of these districts?

A. It does as far as Lordsburg, but for the territory Lordsburg to El Paso Exhibit 214 includes several short El Paso Strauss turnaround trains which I didn't use in making this percentage computation.

[fol. 3219] Q. Are those the El Paso-Strauss turnarounds mentioned in the testimony of Mr. Herrell?

A. Yes. Some were operated in actual performance, but we operated more on redispatch.

Q. Well, I take it that the total figures in the lower block on Exhibit 221 for identification, may also be checked against the train sheets?

A. That is right.

Q. And the white work sheets A?

A. Yes.

Q. And the exhibit which you speak of which is to be introduced following Exhibit 221 for identification is likewise predicated upon the train sheets and white work sheets A?

A. That is right.

Q. You derive a ratio between the actual train and the redispatched train as shown by the actual train sheets and the redispatched train sheets for the entire territory covered, did you?

A. Yes.

Q. And that is the ratio of percentage which you used in obtaining the figure in column E?

A. That is right.

Q. Now, did you make any similar reduction in obtaining the total of redispatched passenger train, column F?

[fol. 3220] A. No, they were left the same. This percentage reduction applies to freight trains only.

Q. If there were any fewer trains operated, fewer passenger trains operated under this redispatching study, that has not been carried into this showing?

A. That has not been taken account of here.

Q. Now, to obtain the figures in column H, did you follow the same process as in obtaining the figures in column D?

A. That is right.

Q. By the use of the curve on the second sheet?

A. That is right.

Q. Now, as to the recapitulation, is that simply an addition of the figures appearing in the columns above?

A. Yes.

Q. Plus the multiplication to expand the showing for the annual bases?

A. Yes.

Mr. Mason: Have you any questions, Mr. Strouss?

Mr. Strouss: Yes. Mr. Sines, how did you determine the days that you used on page 2?

A. Those were selected to give us as big a range as possible by which to locate the course of the line. It wouldn't [fol. 3221] have done, for instance, to select days which would give a group of points immediately in the middle of the chart. We took a peak day, the peak day of 1938, June 18th, then went to August, which we know is the lightest month of 1938, and picked one of the lightest days in August, which is August first, in order to get a point way down on the curve.

Q. Now, then, column A on sheet 1, how did you arrive at that figure?

A. That is a count of freight trains from the actual train sheets made in the same way that we made the count of trains for the date as shown on sheet 2 of this exhibit, and also, as I have described in connection with Exhibit 229.

Q. Well, in other words, this is an actual count of trains operated on the day indicated, counting a train for each division through which it passes?

A. Yes.

Q. Then, passenger trains in column B, that would be the same?

A. The same.

Q. Now, then, column D is the application of the formula that you arrive at on page 2 to the totals shown under column C?

[fol. 3222] A. That is right.

Q. To arrive at what you denote as the probable meets and passes?

A. Yes.

Q. Now, the figure shown in column E, how did you arrive at that? I didn't quite understand that.

A. Well, by the tabulation at the foot of the sheet, I determined that the ratio of actual trains to redispatched trains was as 100 per cent is to 72.30 per cent, actual against redispatch, and that is again in its average aspect because we have June and August in there, so I applied that 72.3 against the count which I had previously made in column A.

Q. And by that arrived at the figures shown in column E., That would again be the probable number of freight trains operating in the redispatch?

A. Yes, that is right. Excuse me now. As the probable number of trains that would have been operated had we conducted a redispatching study on every one of those days.

Q. Now, the passenger trains, there is no change from the actual, is there?

A. No.

[fol. 3223] Q. Then column G is the total?

A. Yes.

Q. And column H, using that total in your formula, you arrive at what you term the probable number of meets and passes on redispatch?

A. Yes.

The Court: Your redispatching study didn't cover, though, all of the year 1938?

Mr. Strouss: No, June and August, wasn't it?

A. No, our redispatching study just covered two months of 1938, June and August.

The Court: Pardon me, then where do you arrive at these figures out here in the redispatch columns E and F for the ten months not covered by your redispatching study?

A. By applying the ratio of percentage there, 72.3. In the beginning, when I first described this redispatching

study, I said that we have chosen the months of June and August, 1938, because June is a peak month and August is the month of lightest traffic, and the results from that selection would reasonably give us a cross-section of operations for the year 1938. Now this 72.3 is taken from that, is taken from the maximum and minimum months, and I have applied it against the entire year.

[fol. 3234] Mr. Mason: 72.3 represents the number of trains operated during the two months of June and August on the redispatching study assigning a value of 100 to the number of trains actually operated during the months of June and August, does it?

A. That is right.

Q. So that, taking June and August as a cross-section of the year, you may fairly assume that the entire year's trains will be reduced in the same proportion?

A. Yes.

Q. Is that what you have done here?

A. That is right.

Mr. Mason: Have you any other questions, Mr. Strouss?

Mr. Strouss: No.

Mr. Mason: Has the Court any other questions?

The Court: No.

Mr. Mason: We offer the exhibit in evidence as Exhibit No. 221.

Mr. Strouss: The same objection as to the previous exhibits, as irrelevant and immaterial, calls for the conclusion of the witness, assumes facts not in evidence and purely speculative.

Mr. Mason: As to the assumption of facts not in evidence, [fol. 3225] I take it, your objection is not because the exhibit has not yet been introduced, because the train sheets, the actual and redispatch, and the white work sheets A, really form the foundation of the computation as to the number of trains, and those are in your possession, but as to the exhibit, that will be introduced.

Mr. Strouss: No.

The Court: Well, I will hear you on that, Mr. Mason. I am inclined to think the objection is good to this particular exhibit.

Mr. Mason: Your Honor, I think if the exhibit is understood, that the objection is no more tenable than the objection made to prior exhibits.

The Court: I might shorten this up—I don't know that you need to take this in the record unless you want to. It seems to me that we are rather building an inference upon an inference here.

Mr. Mason: I don't think it goes to that end. We are applying a mathematical formula to facts which we know. First of all, the formula itself is derived from the actual operations, and does not depend to any extent nor in any degree upon any redispatched operations; the formula is simply the derivation from the plotting of points which [fol. 3226] relate entirely to actual operations. Mr. Sines, as he explained in his testimony, selected altogether nine dates during the months of August and June of 1938, counted the trains operated on those dates, and from the actual train sheets counted the number of meets and passes which were made by those trains; then plotted those points on a chart, and then from the location of those points was ably, by the use of rather common mathematical process, to determine a curve which would pass through those points or so close to them as to indicate that it was the curve upon which those points would be located. Then, having located that curve and determined its equation, we proceed to the redispatching study. Now, the redispatching study shows for the two months which are representative of the year, the actual number of trains operated and the number of trains necessary to be operated to carry the same traffic without the restriction.

The Court: It seems to me, Mr. Mason, that that is the weakness in your link here.

Mr. Mason: Well, if the redispatching study is admissible or, let us say, for example, and I don't think there is any question about it, that Exhibit 220 is admissible as [fol. 3227] showing how trains did operate and how trains would be operated or were operated on the redispatching study by the same dispatchers, and it seems to us there can be no question as to that, then it is equally proper to take the work of those dispatcher as showing the number of trains actually operated during the entire two months' period and the reduction of those trains which would be accomplished, reduction in their number, I mean, which would be accomplished by operating free of the restriction. That is to say, that you can find out if you were operating 27.7 per cent less trains—that is not exactly the figure—but you would operate 72 trains, let us say, where before

you had operated 100 trains. The redispatching study shows that just as concretely as it makes the showing on the exhibit 220, which indicates that during the days there were operated 89 trains and under the redispatched operations there would have been operated 68 trains. Now, if we show during those two months we operated 100 trains and under the redispatched we would have operated 72, then taking those two months as representative of the year, we can expand that showing for the entire year and say that for the year, because the two months are representative, 72 trains would have been operated under long-train operation as compared to 100 trains operated under short-train operation, or, as the exhibit shows, as the train sheets show, 2,968 trains were operated during the two months actually, and without the law 2146 would have been operated. If the showing for the two months is representative of the years shown, it is representative for the purpose of obtaining a comparison of the number of trains to be operated during the entire year; and then it is only necessary to indicate the number of trains which would have been operated for each day, because the same ratio by and large will hold for the year, and every day of the year. It may be that more than the 72 trains operated would have been run on January first, but it is equally likely that the variation from 72 per cent would iron out when you take 24 days, or, especially, when you take the entire year. The purpose of the exhibit is not to show, necessarily, that exactly this number of meets and passes would have taken place either actually or with the lesser number of trains, but substantially what the proportion and the reduction would be. We know that the reduction would occur in accordance with the equation. The only thing necessary to do is to associate it with a series of days in order to obtain [fol. 3229] a cross-section of the year. This undertakes to show 24 days of the entire year. I can't see that it is building inference on inference, it is rather using a cross section of the year for the purpose of obtaining a result. We agree that it is possible that with the redispatched operation there would be more than 1,711 meets and passes for the 24 days, or more than that number expanded by 15.2 per cent for the entire year, and it might well be less, but it will vary very little from that figure, and certainly the relationship as between actual operation and redispatching operation is going to persist, because the mathematical formula used is

unquestionable. There cannot be any dispute as to that. Another mathematician of equal or greater competency than Mr. Sines would arrive at the same result, would arrive at the same curve, and would solve it in the same way, and the equation is not in any sense a speculation.

Mr. Strouss: I think the Court has stated my position entirely. Mr. Mason has shown the soundness of the objection. His whole argument is an argument of "ifs." This is purely a speculative proposition, taking trains which are shown by the actual and having two months of operation, [fol. 3230] then from that build up the year, assuming first the number of trains will be run in the redispatch, then having assumed that they assume that the meets and passes would occur; it is an assumption all the way through, and on top of that, of course, in order to build up through the year, they have to assume that the operating conditions would be the same all year around. If there was ever a case of evidence that is speculative, this is it.

Mr. Mason: In a sense, the redispatching study is predicated, of course, upon the assumption of a condition which, as we know, does not exist. It is predicated on the assumption that the law is inoperative and set aside.

The Court: So far as your redispatching study is concerned, the Court has ruled with the defendant. In that, the Court felt that you laid the proper foundation; you showed by experienced, skilled men who have spent months in these operations, and after all these various factors had been taken into consideration in these assumed operations, and in order to permit you to make the comparison the Court admitted in evidence the redispatching studies. But now, it seems to me, and I am not finding fault with the exhibit on account of a mathematical calculation involving [fol. 3231] the well-known principles of mathematics, even though it gets up into the higher realm, into trigonometry to do it, but, as Mr. Strouss has stated, it seems to me it is predicated upon too many "ifs" and too many different assumptions to make it of very much value. It seems to me it is highly speculative. The Court will sustain the objection to it.

Mr. Mason: I take it that the objection was principally because of the showing as expanded to the year by the application of the same ratio.

The Court: I think that is one of your weakest points.

Mr. Mason: That is probably the only point of the objection; there hasn't seemed to be any serious question, I don't think there has been any serious question by Mr. Strouss that the two months are representative of the year. We can show the ratio, of course, that the two months' traffic bears to the entire year. The point is this, a study of this kind could be made and restricted, if you will, to the two months, June and August, 1938, and escape the principal ground upon which the objection was made.

The Court: We will cross that bridge when we get to it.

Mr. Mason: We might make that study because I think [fol. 3232] it would be informative. There is no way of disputing the fact that with an increasing number of trains, meets and passes will increase and they will increase out of proportion. No one questions that seriously, I don't Mr. Strouss does. Again I suggest also that Sheet 2 of this exhibit which contains the derivation of the formula and which is based upon actual observations, observations of the actual operations and not in any sense upon the redispatch, is not open to the objection made and might well be received even though the conclusions on the first sheet are subject to the objection.

The Court: Well, of course, the exhibit was offered as a whole.

Mr. Mason: That is correct.

Mr. Strouss: I can't see where there would be any materiality to the second sheet.

The Court: The second sheet forms the basis for the data contained on the first sheet.

Mr. Mason: I take it that the second sheet in and of itself would still show, and I think it is very material to the case because the more meets and passes the more interference, and as our answer alleges, the more meets and passes the more hazards because men getting on and off trains to open [fol. 3233] and close switches must run to catch up with their train and must run ahead of the train.

The Court: There is nothing before the Court, Mr. Mason. It is so near the noon hour, we will take our noon recess at this time.

(Thereupon, at twelve o'clock M. the court stood at recess until two o'clock P. M. this day.)

[fol. 3234] 2 P.M., January 29, 1941.

All parties being present as heretofore noted, proceedings were resumed as follows:

B. S. Sixes resumed the witness stand.

The Court: You may proceed.

Mr. Mason:

Q. Mr. Sines, have you before you a chart in one sheet entitled, "Yuma, Arizona-El Paso, Texas, Via Gila and Lordsburg, Locomotive Requirements for Long Train Operation, June 16th to 20th, 1938"?

A. I have.

Mr. Mason: May this be marked exhibit No. 222 for identification?

The Court: It may be marked.

The Clerk: Defendant's exhibit No. 222 for identification.

Mr. Mason:

Q. From what source was this exhibit prepared?

A. This was taken from the redispatch train sheets.

Q. For what period?

A. For the period June 16th to June 20th, 1938.

Q. Why did you take that period?

A. That is the maximum five-day traffic period during [fol. 3235] June, 1938.

Q. What is the purpose of exhibit No. 222?

A. The purpose is to determine the minimum number of locomotives which will be required to fulfill the locomotive requirements developed by the redispatching study.

Q. Is it to obtain the figure of the minimum number of locomotives of the type contemplated for the redispatching study required to handle the maximum day's or maximum volume of traffic during the redispatching period.

A. Yes.

Q. Did you prior to the start of the actual work of redispatching have any discussion at your conferences with respect to locomotive requirements?

A. Yes.

Q. Did you reach any conclusion as to the probable number of locomotives which would be required to carry out the plan as then contemplated?

A. Yes, as a result of those discussions I estimated we would require thirty AC-8 locomotives to fulfill the requirements for the road locomotives. That was based upon actual performance of 1938 when we were running eight or nine trains in each direction daily, and I estimated [fol. 3236] that removal of the restriction of the 70-car limit law would permit us to reduce the movement of eight or nine trains to approximately six trains per day in each direction.

Q. Over each subdivision?

A. Yes, and then considering the distance from the terminals through which those locomotives would operate it was apparent we would need about five times those six locomotives in order to man the service and that gave me the total of thirty.

Mr. Booth: You said "ave times six locomotives." You mean five times the six trains, don't you?

A. That is right.

Mr. Mason:

Q. Was the study represented by exhibit No. 222 undertaken after the redispatching study was completed?

A. Yes.

Q. What were you undertaking to ascertain by this study?

A. What the absolute minimum requirement would be under that thirty. When I started the redispatching party of dispatchers that worked at Los Angeles at the beginning of the study, I gave them instructions relative to thirty AC-8 locomotives.

Q. Did you tell them they would have thirty AC-8 loco- [fol. 3237] motives in the pool for the main freight line between Yuma and El Paso?

A. That is the number I was figuring on tentatively although I expected to reduce that a little bit, but I did not want them to take the time and effort to redispatch the locomotives for the entire sixty days. I intended to take the train redispatching for the maximum period such as this, the five days between June 16th and June 20th, and assign locomotives to the trains as the requirements ap-

peared during that peak period after their redispatching study was completed.

Q. Could you by a study of the peak period determine the number of locomotives required for any other day during the period?

A. Do you mean for any other day other than the peak period?

Q. Perhaps I should reframe the question. Would the determination of the minimum number required for the peak period of traffic also constitute a determination of the number required for any other day during the two months' period studied?

A. Yes, if we found that a certain number of locomotives were able to move the trains during the peak period, surely that same number of locomotives would move a lesser number of trains.

[fol. 3238] Q. In your redispatching study, how did you contemplate that the locomotives assigned as train locomotives would be operated, that is, into and out of terminals and with respect to time at terminals?

A. For the purposes of this chart I figured that the locomotives would operate on the first-in-first-out basis and provided in all instances that there would be standby locomotives to man the services. It was possible to do that, I say in all instances with the exception of very short periods which will appear later and to which I will call attention. When I say first in and first out, I mean taking a terminal like El Paso where there would be several locomotives in the terminal at any time, that the locomotive that had been in there the longest or that had come in first would go out first.

Q. Did you contemplate any servicing at El Paso?

A. Yes, El Paso would be the point where the major repairs would be performed and would generally be the point where engines would be blown down and washed.

Q. Would they receive such servicing as necessary at Yuma or Tucson?

[fol. 3239] A. Yes, that same washing service would and could be performed at Tucson and Yuma also.

Q. Are you familiar with the requirements for periodical inspection of locomotives?

A. Yes, in addition to the washing which is given a locomotive after a certain number of miles has been covered

it is necessary that the engine also be given a Federal inspection at least once every thirty days.

Q. Does that take some time?

A. The engine should be out of service a minimum of twelve or fourteen hours.

Q. That is from the time it is received at the roundhouse until it leaves the roundhouse to go in service again?

A. From the time it comes into the terminal until the time it can go out again.

Q. Did your plan contemplate sufficient time at El Paso or some other terminal for the purposes of Federal inspection?

A. That is right.

Q. Is that Federal inspection performed by company employees, do you know?

A. Yes, it is performed by company employees.

Q. And a record is made of it, is it?

A. Yes.

[fol. 3240] Q. Now, will you explain just how this chart, Exhibit No. 222, is drawn? Does it purport, for example, to show the movement of locomotives?

A. It shows movement of trains and the assignment of locomotives to those trains.

Q. Is it somewhat similar to the chart which has been received in evidence as Exhibit No. 220?

A. Yes; exhibit No. 220 shows the train movements for June 18, 1938, and this chart also includes the train movements for June 18, 1938.

Q. You don't show any stops at intermediate points here?

A. No, the lines are drawn continuously from terminal to terminal except in the case of unusual occurrence, such as engine failures, and we had two during this five day period.

Q. Now, you show types of locomotives by different indications, do you?

A. Yes, both by indication and by engine type numbers written on the lines which represent the engines.

Q. Is there a particular designation for the AC type locomotive, for example?

A. The AC type locomotives is a continuous full line without any number designation at all. That is indicated by the legend in the middle of the sheet at the bottom.

[fol. 3241] Q. And what do the numbers or lettering, various phrases and numbers alongside the lines, indicate?

A. They indicate the designation of the trains to which these engines are assigned.

Q. Now, taking this solid line, I notice there is a somewhat heavier line which starts at the lefthand side of the sheet. What does that indicate?

A. I took two lines, one of them starting at the lefthand side of the sheet, and caused it to be drawn somewhat heavier than the rest of the lines merely to make it convenient to follow with the eye should we care to describe the history of that particular locomotive.

Q. Does the heavier line indicate anything more than any of the other solid lines?

A. No.

Q. It is simply for ease in following?

A. That is all.

The Court: Then you mean, Mr. Sines, that on this exhibit, taking one of your heavy lines for instance, would illustrate the movement of that particular locomotive during the five days in question?

[fol. 3242] A. That is right. I brought that heavy line up to the middle of June, 18th, and then an engine failure occurred there causing us to swap engines and trains, so I simply picked up another engine at Tucson, which was the first one ready to go, and followed that across the chart.

The Court: Well, I believe that the other day, in response to a question from Mr. Strouss, that you stated in your redispatching study that you didn't give numbers to the locomotives used, you had a pool from which you drew but no specific numbers were assigned?

A. That is right.

Q. Now, on this exhibit is a specific number assigned to the locomotive?

A. No, I still haven't assigned any specific number to the locomotive, neither do the dispatchers.

Q. But, even if a specific number is not assigned, the heavy line that we have just referred to does designate definitely a locomotive and its movements during the period covered by this exhibit?

A. Yes, with the explanation in the middle of the chart, I jumped from one engine to another.

Mr. Mason: Now, Mr. Sines, referring to this heavy [fol. 3243] line, I notice that it starts out at Lordsburg and is level; that is, it has no slope one way or the other for a considerable period. What does that indicate?

A. It means it is standing in Lordsburg awaiting service.

Q. From midnight until a later hour?

A. Yes, sir.

Q. Is this a chart of hours on the lefthand side of this chart?

A. Yes, that is a chart showing the hours, it shows a 24-hour period.

Q. The chart up and down indicates the district Yuma to El Paso?

A. Yes.

Q. According to scale?

A. Well, it is a pretty good scale.

Q. What happened to this heavy-line locomotive at 3:15 or 3:30 A. M. Thursday, June 16th?

A. He was put on a train and went to El Paso.

Q. Does the line indicate when he went to El Paso?

A. Yes, the time can be read approximately.

Q. Then the line, I notice, crosses perpendicular to the long axis of the chart down toward the foot of the chart; what does that mean?

[fol. 3244] A. That goes to the foot of the line of engines that are awaiting service.

Q. He is the last in, is he?

A. He is the last in, yes.

Q. All these lines above are engines in earlier, is that right?

A. That is right.

Q. Now, the line goes along parallel to the central axis of the chart. What does that mean?

A. That he stays in El Paso almost twenty-four hours.

Q. Does he stay in El Paso until he becomes first out?

A. That is right.

Q. How do you find out that he became first out?

A. Well, as trains leave El Paso subsequent to his arrival at El Paso, those engines that were there ahead of him are assigned to trains successively until he stands first out and he catches a train at the time indicated.

Q. Now, these lines at which these angling lines strike the line representing El Paso, represents arrivals or de-

partures of trains as the case may be, as shown by the redispatch train sheets?

[fol. 3245] A. Yes.

Q. Then your level black line at El Paso then returns to the El Paso station line at a point approximately ten A. M. on Friday, June 17th?

A. That is right.

Q. Then what happens?

A. He goes west on S. S. W. third 17.

Q. Does this angling line from El Paso to Lordsburg indicate that he is enroute during that period?

A. Yes.

Q. Then the time that the angling line strikes the station line to Lordsburg indicates his arrival at Lordsburg?

A. That is right.

Q. Then what happens?

A. Well, there is an engine available and ready for service at Lordsburg when he gets there, so they take him off to be serviced and the engine that is ready takes his train out.

Q. What happens to the locomotive represented by the heavy line?

A. He stays at Lordsburg for about four hours.

Q. Is that what you call "dropping back?"

A. Yes.

Q. And what is the effect of dropping locomotives back [fol. 3246] in that fashion?

A. That means that you have to provide more locomotives than where those engines run through.

Q. Does it mean that you generally have a locomotive available at the drop-back intermediate terminal?

A. Yes.

Q. Now, you show this same locomotive as staying at Lordsburg then until about five-thirty?

A. That is correct?

Q. Then what happens?

A. He catches a drag west going to Tucson.

Q. Now, between five-thirty, apparently, and about seven-forty-five, there is no locomotive at Lordsburg at all, is there?

A. That is right.

Q. Do I understand that where there is a locomotive line parallel with a station line, that indicates a locomotive stands at that terminal?

A. Yes, sir.

Q. If there is more than one such line, there is more than one such locomotive?

A. Yes, you can count them and that will give you the number of locomotives standing at the terminal.

Q. Do you show the progress of your locomotive with [fol. 3247] the heavy line westward toward Tucson?

A. Yes, he got as far as Benson where he was delayed for about forty minutes, and then went to Mescal where he became involved in an engine failure of another train.

Q. When was that; what time of the day?

A. About three A. M.

Q. On June 18th?

A. Yes.

Q. Now, do you show that occurrence in your chart of the movements of redispatched trains on June 18th on Exhibit 222?

A. That is right, that is on the redispatch chart on Exhibit 220.

Q. 220, yes.

A. It is also on the actual chart.

Q. There was an engine failure on the actual at Mescal, was there?

A. Yes.

Q. Shown on the chart on Exhibit 220?

A. That is right.

Q. And reproduced on the redispatch at Mescal at the same time?

A. That is right. Then we came along to determine what the locomotive requirements would be for this period, and [fol. 3248] we worked our way through that locomotive failure also.

Q. And the way you worked it through is indicated on the chart, Exhibit 222?

A. Yes, sir.

The Court: Well, was that particular locomotive withdrawn from service then during the balance of this period, June 19th to 20th?

A. Now, the locomotive failure occurred to an engine which was on Y308-309 going east, and when our engine

that we started originally at Lordsburg got to Mescal, they took that engine off the westbound drag and put it on the eastbound train, Y308-309. A helper then took our westbound drag into Tucson, and that is indicated by the dash line with the figures 5,000 under it. The locomotive which failed on Y308-309 is shown standing at Mescal until 2:10 P. M. when another drag train came along west, picked him up and pulled him into Tucson, and there is a notation there which says, "To shop," meaning that this particular engine on the redispatch went into the shop, and thereupon, for the rest of this two-and-a-half day period on this chart and also for the rest of the month we considered that that engine was out of service because that is what actually happened, the engine which failed at Mescal on June 18th [fol. 3249] at 3:00 A. M. didn't show up for service any more during June, 1938, it was in the shop at Tucson.

[fol. 3250] Mr. Mason:

Q. You mean you reproduced in the redispatch what actually occurred to the locomotive that actually failed early in the morning of June 18, 1938?

A. That is right.

Q. In order to trace the further course of the locomotive, did you pick up another AC locomotive which was standing ready for service at Tucson?

A. I might have turned back on Y-308-309 to follow the particular engine I started out with but I wanted to go over to Gila and Yuma for purposes of demonstration and illustration so I jumped up to the engine which was first out at Tucson and picked him up about 5:15. You will notice the horizontal line becomes heavy directly beneath the word "Ajo."

Q. That is another AC locomotive which you can trace from somewhere else?

A. Yes.

Q. You have only made it heavy here in order to bring it to the west of Tucson?

A. That is right.

Q. What does that locomotive do for the next few hours after you picked him up?

A. He has been at Tucson since a little before eleven P. M. the day before and he stays at Tucson until a little [fol. 3251] after eleven A. M. the next morning, when he goes out on the drag train leaving Tucson about 11:20 A. M.

Q. Where does he go?

A. He goes to Gila, drops back at Gila, catches the second train out of Gila after his arrival at Gila, and goes to Yuma. He is at Yuma five hours, catches the Colton fruit block back to Gila, drops back at Gila, catches the Y-316-317 to Tucson. He is at Tucson five hours, goes back on the GBW to Gila. He is at Gila only an hour and a half when he returns to Tucson and this time he stays at Tucson approximately nine hours before taking a train west.

Q. How can you tell that a locomotive is first out at a particular terminal?

A. By the mechanics of drawing this chart.

Q. When there are no lines between the station lines and the locomotive's own line drawn parallel to the station line?

A. Yes, that is the thing that determines whether he is first out or not.

Q. I notice at Tucson you show a number of dashed or dotted lines. What do those indicate?

A. Those indicate helper locomotives assigned to the Tucson-Dragoon territory.

[fol. 3252] Q. When those locomotives are standing still at Tucson, how is that indicated?

A. The line continues horizontally to the right.

Q. And when those locomotives are in active helper service handling or assisting trains, how is that indicated?

A. They are drawn along closely parallel to the train which they are assisting.

Q. Do you show them also returning light from the cut-off point back to Tucson?

A. Yes, they return light to Tucson in some instances and they are also shown coupling in with westbound trains at both Dragoon and Benson.

Q. I take it that the chart is entirely a time chart and does not attempt to show distances traveled by the locomotives but rather the time that they were engaged in particular services or waiting, is that correct?

A. Time is the essential element but you could compute miles off of this if you had the timetable in one hand and the chart in the other.

Q. You could figure out the locomotive miles made?

A. Yes.

Q. Could you also figure the hours enroute between ter-[fol. 3253] minals as contrasted with the hours spent in terminals awaiting service?

A. Yes.

Q. You show at the top of the chart immediately under the title the figure "27" for midnight June 17-June 18 and the figure "26" for midnight June 18-19. Are there other figures on the chart which correspond to those?

A. There are.

Q. What do they mean?

A. That is the count of the AC-8 locomotives made over twenty-four hours to indicate the number of AC-8 locomotives on that chart. The difference to which you called attention which occurs on June 18th with 27 in the morning and 26 at night is due to the fact that one of our AC locomotives has gone to the shop at Tucson and he stayed in the shop. As I have indicated heretofore, this count is also a verification of the accuracy of the chart. We start out at midnight, June 15th, June 16th, with 27 AC locomotives, that is, you can actually count them, 27 locomotives on that midnight line. Then the next midnight we can still count 27 locomotives, we get the same thing the following night and so on across the chart. In other words, [fol. 3254] we haven't picked up but we haven't lost any locomotives.

Q. You called attention to the showing of engine failure at Mesyal on the morning of June 18. Is there a showing of another engine failure on the chart on another day?

A. Yes, on June 19th in actual operation there was an engine failure at Cambray at approximately three A. M. to the engine pulling Colton block 413. We reproduced that on our redispatch train sheet and of course provided for it on this exhibit No. 222.

Q. How did you take care of C-413 and bring it to El Paso? Does the exhibit show?

A. Yes, on our redispatch operation the chief dispatcher Herrell allowed enough time for the train crew at Cambray to notify the dispatcher's office at El Paso that their engine had failed and to permit the office at El Paso to call a new engine crew and get a new engine ready and get it started west to Cambray. Its departure at El Paso is indicated about 4:30 and its movement thence to Cambray is indicated by the line with the word "light" above it. That engine got over to Cambray and about thirty minutes later towed

the dead engine and train C-413 into El Paso. That was not a serious failure, however; the engine returned to [fol. 3255] service. As I remember, that was just an air pipe that broke on that engine.

Q. You duplicated on the redispatch operation the actual failure including the actual disability that occurred to an engine in actual practice at Cambray at that time?

A. Yes. I should qualify that to this extent; I determined that it was an air pipe that broke but just when that engine went back into service at El Paso, I didn't check that.

Q. Would it be possible to make a chart of the actual engine movements from the actual train sheets during the period June 16th to June 20th, 1938, for the territory covered by exhibit No. 222 for identification?

A. Yes.

Q. Would it resemble this chart somewhat in the same manner, for example, as the actual and redispatch charts on exhibit No. 220?

A. It would look very much like it only it would have more lines on it just as the actual chart on exhibit No. 220 has more lines.

Q. I take it this showing covers only freight train locomotives and the helper locomotives used to handle those freight trains?

A. Yes.

[fol. 3256] Q. There is nothing here with reference to passenger trains or passenger locomotives?

A. No.

Mr. Mason: Have you any questions, Mr. Strouss?

Mr. Strouss: No questions.

Mr. Mason: Has your Honor any questions?

The Court: No.

Mr. Mason: We offer exhibit No. 222 in evidence.

Mr. Strouss: The same objection as made to the previous exhibits.

The Court: Objection overruled, it may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 222.")

Mr. Mason:

Q. Will you explain again, Mr. Sines, just how you got the actual number of AC-8 locomotives required for the maximum or heaviest day?

A. The requirement developed by this chart applies for each day of the five-day period and not only for the maximum day; but the five-day period does include our maximum day, therefore, we know that the assignment that we have here will take care of any other situation that might [fol. 3257] arise in 1938. By providing sufficient lay-over time at El Paso, Tucson, and Yuma to service and wash these engines and by providing sufficient time at Gila and Lordsburg for servicing and by having standby engines at all these terminals with the exception of the short periods, some of which we have indicated here, we determine that 27 AC-8 locomotives will have been required for the first two and one-half days and that thereafter we could have gotten along with 26 locomotives. The actual determination itself is made simply by counting the number of locomotives in service at any one time.

Q. Including those standing by at terminals?

A. Yes.

Q. And the number of locomotives in service can be determined simply by counting the number of solid lines you cross at any hour?

A. That is right. I have counted them at midnight, but that count could have been made at any other hour during the day.

Q. Does the chart show how many locomotives were standing by available at any of these terminals at any particular hour that you want to select?

A. Yes.

Q. Simply by counting the number of parallel lines? [fol. 3258] A. That is right.

Q. Were you able by means of this chart to determine the number of helper locomotives required for the purposes of the redispatching study?

A. As to that I verified the judgment of the chief dispatchers who themselves figured on the number of locomotives they would require at Gila and Estrella and San Simon and Steins. You will recall in their testimony they said that they put engines and helper crews in service as needed. Mr. Baker provided for two 5000's and one 3700 engine at Gila and two 5000's at San Simon, and when we drew this chart it appeared that Mr. Baker's helper assignments were adequate. At Tucson I determined the helper locomotives from the assignments which had been made to individual trains as they were operated

out of Tucson on the redispatching study and those locomotives bear the same relationship to the making of this assignment as do the locomotives operating out of Yuma and El Paso.

Q. Does the chart show the use of train locomotives other than the A6' class where such locomotives were used?

A. Yes, on the redispatching study, dispatcher Baker figured he would have an assignment of 3600's, those are [fol. 3259] the light 2-10-2's, operating between Yuma and Tucson to handle trains known as the Ajo drags and the TXM's. Occasionally those trains were heavier than what a 3600 would handle, however, and it was necessary to put a 4100 on the Ajo drags and the TXM's. When the redispatching train sheet indicated that dispatcher Baker had done that, we reproduced his selection on this chart. The 3600's are indicated by the dashed line. One of them is shown leaving Yuma at 6:30 P. M., and prior to 6:30 P. M. at Yuma two of them are shown standing at Yuma awaiting service.

The Court: Mr. Sines, is the ore from the mines at Yuma hauled to the smelter at Douglas, or what is the nature of that load?

A. Those are concentrates and come from Ajo, coming into our main line at Gila, not Yuma. The concentrates are handled on trains from Gila into Tucson and go to Douglas.

Mr. Mason:

Q. Have you another statement in one sheet entitled, "Locomotive Assignment, Weight and Investment, Yuma, Arizona, to El Paso, Texas"?

A. Yes.

Mr. Mason: May this statement be marked "Defendant's Exhibit No. 223" for identification?

The Court: It may be marked.

[fol. 3260] The Clerk: Defendant's exhibit No. 223 for identification.

Mr. Mason:

Q. Did you prepare exhibit No. 223?

A. I prepared a considerable part of it, it was done under my supervision. I have checked it and it is correct.

Q. From what sources did you prepare it?

A. The information under the "Actual" is taken from the mechanical department's report of locomotive assignments as of June 30th, 1938, and also from an inspection of the actual train sheets to determine the locomotives which were in service, that is, I checked the mechanical department's locomotive assignments to see that the locomotives were actually in operation between Yuma and El Paso. The information shown under the "Redispatch" comes from the exhibit previously introduced, No. 222, with an allowance of 10 per cent for shopping, and finally I made a check between the actual and the redispatch based upon the reduction in the amount of service that would be required by the redispatched assignments.

Q. When you say an increase of 10 per cent to allow for shopping, you mean you allowed more locomotives than are shown for road service on exhibit No. 222?

[fol. 3261] A. Yes.

Q. Where does that appear? In what line and what column of exhibit No. 223 for identification?

A. In line 6, column D, the number there is larger by 10 per cent than the requirement which I indicated on the previous exhibit, No. 222.

Q. Did you assign helpers as indicated by the redispatched train sheets?

A. Yes.

Q. Are they included in your column D for redispatched assignments?

A. They are, and they may be checked against exhibit No. 222 directly with respect to the Gila-Estrella helper district and the San Simon-Steins helper district. The Tucson-Dragoon helper district assignment on exhibit No. 223 is larger by three units than the requirement indicated on exhibit No. 222. This was because at other times of the month of June dispatcher Baker used engines other than what had been used during the five-day period.

Q. Having gotten the figures in columns C and D in the manner that you have explained, how did you get the figures in the recapitulation, lines 9 and following? Was that entirely by computation?

A. Yes, average light weight of locomotive and tender [fol. 3262] comes from averages I made from mechanical department's record of weight of these locomotives.

Q. Those are based upon the actual records of the mechanical department, are they?

A. Yes, and the actual assignment, column G, is a recapitulation as indicated by a check of the total; column H is a multiplication of the weight in column F by the number of units in column G. The same process is followed with respect to columns I and J. Lines 17, 18, and 19 are derived from information shown in line 16 and also the price per pound indicated in the note at the bottom of the exhibit.

Q. Where did you get that figure of the price of an AC-8 locomotive as shown in the note at the bottom of the exhibit?

A. That was an estmiate which was furnished to me by the mechanical department and it was testified to by Mr. F. E. Russell when he was here at the beginning of the trial.

Q. Is that the figure testified to by Mr. Russell on the first day of the trial?

A. Yes, sir.

Q. I take it that the computation of the price per pound is simply a division?

A. That is all.

[fol. 3263] Q. Have you checked these computations?

A. Yes.

Q. Have you checked the information in the upper block of the exhibit against the actual and redispatch train sheets in the preceding exhibits to determine its correctness?

A. I have.

Mr. Mason: Have you any questions, Mr. Strouss?

Mr. Strouss: No questions.

Mr. Mason: Has the Court any questions?

The Court: This exhibit shows, then, by the use of this heavy equipment or consolidated locomotives that in your redispatch you are able to decrease by twenty-one the number of locomotives necessary?

A. That is right.

Q. And there is an actual increase in the locomotive weight as shown in line 18?

A. Yes.

Q. And then your computation down on line 19 would indicate that your capital investment to provide these

heavier locomotives would run into the last figure shown on line 19?

A. That is right.

Mr. Mason: We offer the exhibit in evidence as defend-
[fol. 3264] ant's exhibit No. 223.

Mr. Strouss: Same objection as made to defendant's exhibit No. 221.

The Court: Objection overruled, it may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 223.")

[fol. 3265] Mr. Mason: Now, Mr. Sines, have you any method of checking the correctness of your computation as to the number of locomotives required for the redispatch operation?

A. Yes; for June 1938, the actual locomotive miles compiled as a part of our redispatch study for the territory Yuma to El Paso was 312,931, and for the same month of June the redispatched locomotive-miles were 214,018. This means that there was a reduction of 31.5 per cent in locomotive mileage during the month of June, actual against redispatched. The locomotives assigned to the main line between Yuma and Tucson were 69 in number, that is, 74 less the five shown between Tucson and El Paso on the south line.

Q. You say between Tucson and El Paso, you mean between Yuma and El Paso via the north line?

A. Yes, that is right, via Gila and Bowie,—will reduce the 69 by the 31.5 per cent, and we find that 47 locomotives would be required if the locomotive requirements descended in the same proportion that the locomotive-miles go down. I have actually provided 48 locomotives for that same territory on the redispatch operation, 48 being the difference between 53 and five on the south line.

[fol. 3266] Q. You have made no reduction in the number of locomotives required for the south line?

A. No, the number of trains operated were the same each day, actual and redispatched.

Q. You haven't calculated the locomotive-miles on the south line in the computation you have made in the relationship there?

A. No.

The Court: We will take our mid-afternoon recess.

(Thereupon, a short recess was taken, after which the witness B. S. Sines was recalled to the stand, and proceedings were resumed as follows:)

The Court: You may proceed.

Mr. Mason: Mr. Strouss, Mr. Sines asked me to say that he has the 1938 locomotive assignment which was used in connection with Exhibit No. 223.

Mr. Strouss: That is the one I had yesterday.

The Witness: That was November, 1940. This is the one that was used to provide part of the information on Exhibit 223.

Mr. Strouss: I think I will enjoy myself looking at the lines rather than at the figures.

Mr. Mason: Mr. Sines, have you before you an exhibit in one sheet entitled, "Tucson and Rio Grande Divisions Through Freight—Pool Service Additional Cabooses and [fol. 3267] Caboose Investment Required by Arizona Train Limit Law."

A. I have.

Mr. Mason: May we have this statement marked No. 224 for identification?

The Court: It may be marked.

The Clerk: Defendant's Exhibit No. 224, for identification.

Mr. Mason: Did you prepare this exhibit, Mr. Sines?

A. It was prepared under my direction. I have checked it and it is correct.

Q. Now, from what source did you take the information shown, let us say, in column D, for these various districts?

A. That comes from the white-work sheets A, the recapitulations, which show the train miles operated in those districts for the month of June.

Q. Do you get the column G figure from the same source?

A. Yes.

Q. Where do you get the figure in column E?

A. Column E comes from a record entitled "Car Dispatcher's Record of Trainmen," also known as Form 7080.

Q. Now, how can you determine from the record of train- [fol. 3268] men the cabooses in service on a particular district?

A. Each time a crew departs and leaves a terminal, a record is made of it on this form showing the names of members of the crew and the caboose used at time of departure or arrival, and also identification of train upon which the caboose was operated. By examining the crew record for a month and counting the numb.. of cabooses that appeared thereon, it was possible to determine the total number of cabooses assigned.

Q. Generally speaking, is each assigned crew also provided with an assigned caboose?

A. Yes.

Q. Now what provision, if any, do you make for extra crews or spare cabooses, if any are required? Does your book show those too?

A. Yes, when extra crews are called, the book shows the departure of those crews and the caboose number that they used on the train.

Q. Did you from examination determine the actual number of the separate individual cabooses that were used in June on the Yuma-Gila district, for example?

A. Yes, sir.

Q. And the same way for each of the other districts?

[fol. 3269] A. That is right.

Q. Was the same process followed in August?

A. Yes.

The Court: Is a freight conductor assigned a specific caboose which he uses whenever he is on the run?

A. If he is in regular assigned service, he does have a regularly assigned caboose. That caboose stays with him sometimes for long periods.

Q. Is that true with an engineer with his locomotive?

A. No, sir; an engineer may have a succession of different engines on each run.

Mr. Mason: Now, how do you obtain the figures in column F?

A. That is the result of a mathematical computation, dividing the train-miles in column D by the number of assigned cabooses in column E, and produces the average miles per month per assigned caboose.

Q. Now, then, the figure in column G is obtained from the redispatch train sheets through the white work sheets?

A. That is right.

Q. Then, how do you proceed from that point of the ex-
[fol. 3270] hibit?

A. Using the same average number of miles per month per caboose, we determine what the caboose requirements would be for a reduced number of train miles. That is done by dividing the figures in column G by the average monthly miles in column H to produce the figure in column I. That didn't always come out even, but the next highest full number was used in putting the result in column I.

Q. In disposing of fractions then, you took the next highest whole number if you didn't have an approximate exact division, is that correct?

A. Yes.

Q. I take it that the figures in line 5 are simple additions?

A. That is right.

Q. And the division of column G by column H is for the purpose of checking the figure shown as the total in column I?

A. Yes.

Q. Did you follow the same process as to August?

A. Yes.

Q. Why did you work out the August requirements having the June requirements worked out?

A. Well, to demonstrate that there will be a reduction in
[fol. 3271] requirements in both August and June.

The Court: How do you account, Mr. Sines, for the fact that there would be such a difference between the month of June and August there as to make the saving in cabooses twenty-one for the one month, and for the other only ten?

A. The total train-miles in each month is considerably different. For instance, in line 5, we see 262,000 train-miles, for June, whereas in line 11 there are only 153,000 train-miles. Now, reducing each one of those by the same percentage will mean that the reduction for the smaller number will be smaller than the reduction for the larger number.

The Court: In other words, the business in June was far in excess of what it was in August?

A. Yes, there was 70 per cent more business in June than in August, basing that on train-miles operated.

Mr. Mason: How do you arrive at the figure of unit cost of a caboose?

A. That was the recorded cost of the last steel cabooses which we had manufactured when this exhibit was prepared.

The Court: When you say "steel caboose" you mean steel underframe?

[fol. 3272] A. No, sir, all steel construction.

Mr. Mason: Is that the type of caboose now being purchased or built by the company?

A. Yes.

Q. From what source do you take that cost figure?

A. From records of the mechanical department.

Q. I take it that in getting the final figure in line 13, you simply multiply?

A. That is right. May I add a little something to this with respect to the question a moment ago why I had shown both August and June. I wanted to be sure and to demonstrate that after I had reduced the 21 cabooses in June, leaving 56, that that number would not be smaller than the net figure left after I had reduced my August assignment.

Q. In other words, you wanted to make sure that your June assignment would still cover your August requirements?

A. Yes.

Mr. Mason: Have you any questions on the exhibit, Mr. Strouss?

Mr. Strouss: No, not at present.

Mr. Mason: Has the Court any further questions?

The Court: No.

Mr. Mason: We offer the exhibit in evidence as defend-
[fol. 3273] ant's Exhibit No. 224.

Mr. Strouss: The same objection as to Exhibit 221 for identification.

The Court: The objection is overruled. It may be admitted.

(The document referred to was received in evidence and marked, "Defendant's Exhibit 224.")

Mr. Mason: Have you before you, Mr. Sines, a statement in one sheet entitled "Yuma, Arizona-El Paso, Texas, Summary of Investment Charges and Annual Charges Incident to Adoption of Long Train Operation?"

A. I have.

Mr. Mason: May we have this statement marked Exhibit 225 for identification?

The Court: It may be marked.

The Clerk: Defendant's Exhibit No. 225 for identification.

Mr. Mason: Did you cause this exhibit No. 225 to be prepared, Mr. Sines?

A. Yes, I prepared some of it, and have checked it and it is correct.

Q. Are the figures shown hereon taken from preceding exhibits?

A. That is right.

Q. What is the source of the figures shown in column A [fol. 3274] for siding extensions, is that Mr. Herbert's exhibit?

A. Mr. Herbert's exhibit. I guess I could have saved some time by indexing these. Exhibit 202 shows $685,985 total increased investment in sidings.

Q. Now, where do you get the roundhouse and shop facilities, the figure in column A, is that Exhibit 205?

A. Exhibit 205 shows an increase of $453,832 in roundhouse and shop facilities.

Q. And the locomotive investment is from one of your own exhibits recently received?

A. That is right. That is from——

Q. 223?

A. Yes.

Q. And the caboose investment decrease is from exhibit 224?

A. That is right.

Q. What is the purpose of the showing in columns B and C?

A. To convert these investment figures into annual charges by applying interest and maintenance and depreciation rates.

Q. Now, first as to the item of interest, columns B and C, you show a particular figure in column B as the interest [fol. 3275] rate. Where do you get that figure?

A. Well, four per cent is a percentage rate which is a judgment figure of what we can do in getting new money nowadays, and it is on the conservative side, inasmuch as our last bond issue in 1936 was at the rate of three and three-quarters per cent, and money which we are getting on equipment trusts is at a much lower rate of interest than that.

Q. Locomotive and caboose investment would be on an equipment trust basis?

A. Yes.

Q. Now, have we any current obligations on which the interest rate is less than four per cent, well, for example, the R. F. C. borrowings?

A. Yes, just what it is I don't know, but I checked these interest rates before I used the four per cent and I know it is less than four.

Q. When you say "conservative" you mean this is a higher rate than the cost of money has been to the company for purposes of this kind in recent years?

A. Yes.

Q. If a higher rate were used here, would that increase the annual charge?

[fol. 3276] A. Yes, sir.

Q. Now, what is the source of the figures shown in column D, as the maintenance cost for sidings?

A. That is a judgment and experience figure which I draw from my own experience in the maintenance department, and which provides at the rate of ten cents per track-foot, a maintenance charge of $528 per track-mile. That $528 per track-mile compares favorably with branch line maintenance charges of $250, $300, and $400 per track mile, where I have had occasion to make studies to determine the maintenance charge per mile or per track-foot.

Q. Will you say whether or not, based upon your experience in the maintenance department, ten cents per track-foot for siding is an ample allowance or a mere average allowance?

A. Fully adequate.

Q. Now, what about the depreciation rate or maintenance rate in per cent shown in column D for the roundhouse and shop facilities?

A. That is the result of a study which was made by the valuation department at my request, and is based upon an analysis of investment and maintenance charges to account [fol. 3277] 235. The title of account 235 is "Shops and Engine Houses." The maintenance rate for the caboose investment is a figure derived from the 1938 annual report. (Addressing Mr. Strouss) I think you have the 1938 annual report.

Mr. Strouss: To the I. C. C.

A. Yes.

Mr. Mason: This figure is taken out of the 1938 annual report, is it?

A. Yes, it is a computed figure, dividing the cost of repairing our freight-car equipment, including cabooses, by the total investment in that equipment. We don't have any repair rate per caboose-mile, so I developed this percentage rate from the figures that I have described.

Q. Cabooses are maintained and repaired in the same facilities and in much the same way as freight boxcars, are they?

A. Yes.

Q. Now, where do you get the depreciation figures in columns F and G?

A. Well, the locomotive investment depreciation figure is the rate which we are charging, and shows in schedule 284 of our annual report to the Interstate Commerce Commission, as does also the figure of 3, the depreciation rate [fol. 3278] for caboose investment, in which I use the depreciation rate for freight car equipment. Again, we don't have a caboose investment depreciation rate.

Q. They are grouped with the other freight-train rolling equipment, are they?

A. Yes, in our reports to the Interstate Commerce Commission.

The Court: Well, Mr. Sines, I find difficulty in reconciling your Exhibit 225 with reference to the caboose item with your Exhibit 224. Now, on Exhibit 224 you conclude that there is an additional caboose investment required, $71,694, which item is carried forward into column A, your total investment here, but throughout on this line of caboose investment you have indicated a decrease.

A. That is right. That is probably due to my selection of words in describing the items on 224. My total says "additional cabooses and caboose investment required by Arizona Train Limit Law." Putting the reverse on that means an investment which would be saved if the law were set aside.

Mr. Mason: Do you mean that the exhibit No. 224 shows, in so far as the figure at the bottom is concerned, that is a $71,000 plus investment, which would be unnecessary and [fol. 3279] would be saved if long train operation according to your contemplated plan were followed?

A. Yes.

Q. Whereas, in the case of locomotives there would be an additional investment of $284,000 to carry out the long train operation?

A. That is right.

Q. So, one of these is a credit charge against the debit charge of the other?

A. That is right.

Q. Whichever side of the picture you chose to look at?

A. Yes, and I reversed this procedure here without thinking where it might lead to.

Mr. Mason: Does that make it clear to your Honor?

The Court: Yes.

Mr. Mason: Now, in this computation here, have you taken the reduced caboose investment as a credit against the added investment required for the other items?

A. I have. The total is the net figure. The total in the last line is in each case a net figure of the sum of the first three figures in the column minus the caboose investment figure.

Q. Do you undertake by exhibit 225 for identification to [fol. 3280] show what the annual increased charges would be incident to the changes in investment required if the law were set aside and the company were to operate as contemplated by the redispatching study?

A. Exactly.

Q. And this amount indicated as the net annual increase in charges would be an offset against whatever money the company might save as operating charges or otherwise, if it operated long trains according to the plan that you have outlined?

A. Yes.

Mr. Mason: Have you any questions, Mr. Strouss?

Mr. Strouss: No.

Mr. Mason: Has the Court any questions?

The Court: I think not.

Mr. Mason: We offer the exhibit as No. 225.

Mr. Strouss: The same objection as to the previous exhibit.

The Court: The objection is overruled. It may be admitted.

(The document referred to was received in evidence and marked, "Defendant's Exhibit No. 225.")

Mr. Mason: Have you a statement before you, Mr. Sines, in two sheets entitled, "Redispatch Study—Operating Sta-
[fol. 3281] tistics, Yuma, Arizona, to El Paso, Texas, Excluding Phoenix Line for Period June and August, 1930?"

A. I have.

Mr. Mason: May we have this statement marked No. 226 for identification?

The Court: It may be marked.

The Clerk: Defendant's Exhibit No. 226 for identification.

Mr. Mason: Did you prepare Exhibit No. 226, Mr. Sines?

A. It was prepared under my direction. I have checked it, and it is correct.

Q. I take it that it has been checked several times?

A. That is right.

Q. From what sources?

A. From the white work sheets A.

Q. Does that go back to the original and redispatch train sheets?

A. Yes, the white work sheets are recapitulations of the actual and redispatch train sheets.

Q. What is the grouping of districts; what is the purpose of that?

A. To analyze the results of the redispatching study for for the territory, Yuma to El Paso via Gila and Bowie, set-
[fol. 3282] ting those results up by individual freight train districts, then to show the results on the south line between El Paso and Tucson via Douglas, show the total on the south line, bring the total north and south lines together, show what the changes are in percentages, and, finally, to expand the changes to an annual basis.

[fol. 3283] Q. I take it that the designation "North Line" as used here means the main freight line via Gila and Lordsburg?

A. That is right.

Q. And the term "South Line" as we have been using it throughout these proceedings is the line via Douglas?

A. Right.

Q. You show on the face of sheet No. 1, particularly in columns E and F certain note references, and F note one of those is carried in other columns. Are those explained on the second sheet?

A. Yes, the second sheet contains those note references and also the derivation of the percentage used in the subdivision XIII at the bottom of sheet No. 1.

Q. The ratio shown in subdivison XIII of the exhibit is derived by taking the actual operations for the two months and the actual operations for the year and comparing them?

A. Yes.

Q. And is used solely for the purpose of indicating what the redispatching study develops for two months carried to an annual basis?

A. That is right.

Q. It does not enter into the computations otherwise [fol. 3284] on the sheet, does it?

A. No.

Q. In obtaining these figures of number of trains, are these by an actual train count?

A. That is right.

Q. And the train-miles are likewise from an actual count of the figures for each train as they appear on the white work sheets A?

A. Yes.

Q. What about the other locomotive-miles?

A. For every train-mile there must be at least one locomotive-mile, but in addition to that one locomotive-mile per train mile there will be helper-miles, helpers returning light, light engine movements, double-header engine movements, which go to make up the total locomotive mileage in any district. You will see by checking that the figures in column D are the sums of the figures in the preceding two columns.

Q. When you speak of "saving for period," do you mean just the two months, June and August, 1938?

A. That is right.

Q. Are those, generally speaking, the differences between the actual figures and the redispatch figures?

[fol. 3285] A. They are.

Q. When you get over to the number of cars, have you made an actual car count of the cars handled on the actual trains and the cars handled on the redispatched trains?

A. Yes, those are the cars accounted for on the actual and redispatch studies and consist of the count made of the trains entering the terminals. For instance, the first count

is made of trains entering Gila. Some point had to be chosen to make the count, and we arbitrarily selected the arriving terminal.

Q. That would be of eastward trains, I take it?

A. Yes.

Q. Westward you would count the trains as they entered what terminal?

A. Yuma?

Q. Between Yuma and Gila?

A. That is right.

Q. Referring to column E, how did you get at the number of cars, is that an accurate count of the cars as they were handled?

A. That is the number of cars that entered Gila eastward and Yuma westward added together.

Q. You explain by reference to note No. 1 on sheet No. 2 just what this difference between the cars handled amounts [fol. 3286] to and how it came about?

A. Yes.

Q. How do you arrive at the figure in column F? Is that a division in column E by the corresponding figure in column A?

A. It is.

Q. Except, of course, as to the saving for the period?

A. Yes, that has to be a difference.

Q. Is the same process gone through with in blocks 1, 2, 3, and 4 that you have indicated for block 1 in these last few questions?

A. That is right.

Q. Going to block 5, will you explain the "turnaround trains"?

A. In actual operation during June and August there were a number of turnaround trains operated which are indicated in column A, but on the redispatch operation there were a large number operated. Turnaround trains operated from El Paso to Strauss usually with an even one hundred cars. They set those cars out at Strauss and return with a light engine and caboose to El Paso. In counting the number of turnaround trains, the movement west was counted as one train and the movement east was counted as one train, so that a roundtrip of this turnaround train was [fol. 3287] counted as two trains in column A, but in column E we only have deliveries being made at Strauss on the westward leg of each of these trips and in order not to lead

to any misconception, when we computed the average in column F we didn't take the sum of westward trains and the sum of eastward trains, one train of 100 cars and the other of no cars and get an average of fifty, but we have shown the number handled on the westbound leg of the trip.

Q. Does this El Paso-Strauss turnaround operation enter into the averages that are shown under the heading in block 6, "Cars per Train," column F?

A. No, and their absence is indicated by note No. 6 on sheet No. 2 which says, "Average cars per train computed, omitting El Paso-Strauss turnaround trains and cars handled by those trains."

Q. Going to the South Line block, blocks VII, VIII, and IX, Mr. Sines, you show, for example, that there were more cars handled in redispatch than there were in actual operation, is that correct?

A. Yes, we took trains off the North Line, we took empty cars off the North Line and sent them through Douglas both eastward and westward.

[fol. 3288] The Court: The same explanation applies to this as to what you have already testified heretofore?

A. Yes, sir.

Mr. Mason:

Q. This is simply a grouping in one place showing operating statistics derived from the redispatched train sheets and white work sheets A?

A. That is right.

Q. Is the entire exhibit brought to one total in block XI.

A. Yes.

Q. And that again is explained as to the totals and averages in column F by note No. 11?

A. That is right.

Q. These percentages in block XII, are those computations from the figures immediately preceding in block XI?

A. Yes, and are capable of check from the face of the exhibit.

Q. I wish you would go to the block on sheet No. 2 of the exhibit, "Derivation of Ratio." How did you determine the gross ton-miles for the months of June and August?

A. That is from information regularly compiled by our accounting department in connection with statistics that [fol. 3289] appear on form 521. 521 is not broken up into

these particular districts, however, so I went back of the form 521 in that regard but they are figures regularly compiled.

Q. These are figures from the same sources as form the basis for the forms 521?

A. Yes.

Q. Are they kept by months?

A. Yes.

Q. They are computed for those districts, I take it, from the conductors' wheel reports?

A. Those are the basic records, yes.

Q. Of course, the same source would give you the figures for the entire year 1938?

A. Yes, sir.

Q. What does the percentage figure at the foot of the block, "Derivation of Ratio," represent?

A. That represents the percentage that the business handled during June and August bears to the total business handled during the year 1938.

The Court: Those are actual figures?

A. Yes, sir.

Mr. Mason:

Q. This is business actually handled and moved over the line in the year 1938 for the two months referred to?

[fol. 3290] A. That is right.

Q. What use do you make of that ratio that you thus developed?

A. I expend the results obtained during June and August, 1938, to indicate what the figures would be on an annual basis.

Q. That is somewhat similar to multiplying the two months' figure by six to get a twelve-month figure except you have used a different multiplier?

A. We have done that, one sixth would be 16.67 per cent and it happened that in 1938 the business for those two months was 17.89.

Q. Is this the same method of expanding to an annual basis that has been used in the previous redispatch studies in the first Arizona case and the Nevada Train Limit case?

A. Yes, the first Arizona case had three months and they expanded their three months to an annual basis; the Nevada case had two months and we expanded those two months

to an annual basis. This study has two months, and I hereby expand those two months to an annual basis.

Q. Would you say, Mr. Sines, basing your answer upon your experience in connection with this and the prior Nevada case and other cases and matters in which you have [fol. 3291] made studies and your general experience in the Bureau of Transportation Research, whether this expansion of a cross-section of a year to an annual basis by this method represents a fair method of arriving at the total for the year?

A. It does.

Mr. Strouss: I object to that as calling for a conclusion.

Mr. Mason: I based it upon his experience, your Honor, and I think he is fully qualified in that respect.

Mr. Strouss: Whether he has used a fair method or not, I think is objectionable.

The Court: The objection will be sustained.

Mr. Strouss: I move the answer be stricken.

The Court: It may be stricken.

Mr. Mason: I take it that the objection being sustained the question and answer are of no significance in the record. Have you any questions, Mr. Strouss?

Mr. Strouss: No.

Mr. Mason: Has your Honor any questions?

The Court: No.

Mr. Mason: We offer the exhibit as defendant's exhibit No. 226.

Mr. Strouss: The same objection as made to exhibit No. [fol. 3292] 221 for identification.

The Court: I will hear you on one phase of that. It seems to me that the Court to be consistent with the ruling made on exhibit No. 221 that possibly the last block, block XIII, might be objectionable. However, there may be a distinction there between the principle governing the two exhibits and I will hear you on it. I am going to overrule the objection as to the first twelve blocks of the exhibit.

Mr. Mason: Your Honor, I think perhaps some distinction can be observed between the two. The showing on exhibit No. 221 for identification was simply taken by months for two days of each month for a twenty-four-day showing and then expanded to an annual basis after being averaged. Here, the two months, it has been testified, are the high and low months of the year, and they have been testified to

without objection to be representative months of the entire years. In order to obtain an annual figure which will have some significance, and I may say that it doesn't make a great deal of difference except for the purpose of obtaining some fairly accurate result whether you take a multiplier of six or a multiplier represented by one hundred divided by 17.89 or what multiplier you wish to take, but there must [fol. 3293] be some multiplier taken to expand two months' showing to indicate an annual result. Now, it seems to us, and the witness testified that he had taken the gross ton-miles, which, of course, represent the total tonnage hauled over the district during the two months and during the twelve months. It is certainly reasonable and certainly fair to assume that if in the two months' period studied approximately 18 per cent of the year's business was handled, then the number of actual trains operated in the course of a year would be in the proportion of eighteen to one hundred, or rather, one hundred to eighteen, approximately, and that in the same way if the business was handled in the redispatch study for those two months in 2,498 trains, in the course of a year the figure representing the total business handled would be approximately five and one-half times as much, or would take about five and one-half times as many trains. We suggest there is no other method, short of taking some multiplier, by which a cross-section of a year's business can be expanded, so as to represent the total for a year, other than this method here. It does not necessarily mean that you have to take the gross ton-miles. Perhaps the train-miles for the year would have been an equally [fol. 3294] satisfactory figure, and probably would not have produced a greatly different result. Perhaps the total car-miles, or some other figure between a two months' period and twelve months' period on some other basis, could have been used. It would have been perhaps sufficient to multiply the result of six, except that we know the business is not exactly constant and this exhibit shows it; but there must be some method short of studying the entire twelve months and redispatching it to get a figure for the twelve months which will be sufficiently accurate for the purposes of this case. The objection, in short, does not go to the admissibility of the testimony, but rather goes to the weight which is to be given, having in mind this particular method of expanding the showing for the two months so as to represent the showing for the twelve months.

Mr. Booth: I should like to be heard just a moment, your Honor.

The Court: You may proceed, Mr. Booth.

Mr. Booth: I think we should approach the reception of evidence of this kind with a somewhat realistic view as to how the testimony is being applied. If this were a suit against the state of Arizona for damages for enforcement [fol. 3295] of the Train Limit Law, it is obvious it would be much different and a more definite type of evidence would be required than has been presented by this exhibit and the other companion exhibits. If this were an action upon an insurance policy to recover damages, the same would likewise be true. But this evidence is addressed to the issue as to whether this law burdens interstate commerce being carried on by this defendant and is responsive to the allegations in the answer that it does burden and burdens it substantially. Now it make- no difference for the purposes of this case whether our annual burden is two hundred thousand or five hundred thousand or a million dollars. The only thing we are required to show under any of the decisions with which I have any acquaintance is that the damage be actual and that it be substantial. I think no one could listen to the testimony in this case or even contemplate the case without hearing any testimony, without being convinced that there could be a substantial saving to this company by the operation of trains free from the restrictions of the law. Everyone knows that it costs a certain amount per train-mile depending on the type of power used, the amount of fuel consumed, wages paid, and all that sort of thing to run a train one mile and everyone [fol. 3296] must know and certainly the evidence in this case has already fully developed that the defendant in this case could run a substantially less number of trains in the state of Arizona to transact its business that is originated here, delivered here, and moves across the state if it were not for the restriction of this law. To come back to my first proposition, I think we should approach the reception of evidence of this kind from a realistic standpoint. The defendant is trying to prove that its operations are substantially burdened by this law in that at a large expense it is necessary for it to run a substantially greater number of trains day in and day out than it would otherwise run if it were not for this law. As I said before, we are not held down to a meticulous showing of any definite amount per

year; for we are not asking for judgment in any amount; but are simply presenting evidence which in the last analysis the Court must draw the conclusion whether or not the defendant is substantially burdened by the enactment of this law. The production of these figures, as Mr. Mason very well said, could have been on a train-mile basis. That was one method used in one of these cases. It could have been on a car-mile basis. It might have been on almost any [fol. 3297] basis, but no matter what basis was used, if you consider what might be done, as has already been abundantly shown, if this law were lifted, no matter what basis was used, some substantial saving would have been effected and it is for the purpose of proving substantiality rather than any definite amount that this evidence is offered.

Mr. Strouss: That is sort of an invitation to me to argue the evidence before it is in, but I refuse. What Mr. Booth has said is true, of course, on the question of whether the cost is substantial or not or that they would be required to prove a definite amount, but we have in the last two exhibits a situation where this one just offered, by taking two months and multiplying by a ratio would develop that two months' so-called "savings" into a year's savings. Then, on the other side, we have the picture of their idea of the investment which would be an added cost by reason of long-train operation, one to offset the other. Now there may come a situation here where this investment cost and the claimed savings would be rather close together and there would be considerable question whether there would be a substantial saving or not. There is hardly anything [fol. 3298] upon which to determine whether there is a substantial saving or substantial burden by reason of additional costs.

The Court: You have this situation with reference to this exhibit, as I understand Mr. Sines' testimony, that the percentage of 17.89 is an actual percentage based—I am not speaking now of the redispatch operations—but it is based upon the percentage of the actual operations for the months of June and August as compared with the total operations for the year.

Mr. Strouss: That is true, but it does of necessity have to assume that operating conditions, in order to have the same relative savings as claimed here, there would have to be an assumption of operating conditions, availability of

traffic, and all of the other things that would go to the redispatch trains in some of those other ten months as the two months here.

The Court: Well, the Court is of the opinion there is a distinction between the two exhibits, and might say I am wholly satisfied in my own mind as to the ruling made on exhibit No. 221. I will overrule the objection and let the exhibit in evidence. We will take a recess at this time until tomorrow morning at ten o'clock.

[fol. 3299] (The document referred to was received in evidence and marked "Defendant's Exhibit No. 226.")

(Thereupon the court stood at recess until ten A. M., Thursday, January 30, 1941.)

[fol. 3300] January 30, 1941, ten o'clock A. M.

Proceedings were resumed at this time as follows:

B. S. Sines was recalled to the stand, and testified further as follows:

Direct examination (Continued).

By Mr. Mason:

Q. Mr. Sines, will you take up next a statement in six sheets entitled "Arrival Time at El Paso, Texas, of Fruit Blocks and Manifest Sections, Actual Operation Compared With Redispatch Operation, With No restriction and Using AC Power and Long Sidings. Months of June and August, 1938?"

A. Yes.

Mr. Mason: May that be marked Exhibit 227 for identification?

The Court: It may be marked.

The Clerk: Defendant's Exhibit No. 227 for identification.

Mr. Mason: Was this exhibit prepared under your supervision, Mr. Sines?

A. It was. I have checked it, and it is correct.

[fol. 3301] Q. From what sources was the exhibit prepared?

A. From the actual and the redispatch train sheets.

Q. Now, I take it that the first sheet is merely a summary of the detail showing on the second and succeeding sheets down to and including the sixth, isn't that right?

A. Yes.

Q. Will you then go to the second sheet and explain the examples shown there, or a few of them?

A. Well, the dates of arrival at El Paso are indicated in column A; the identification of the train is indicated in column B; and the arrival time at El Paso is indicated in column C. Columns B and C relate to the actual performance; then column D indicates the identification of the redispatch train.

Q. Is that the corresponding train shown in column B?

A. Yes.

Q. These are rather perishable blocks than trains, are they?

A. That is right. Then column C indicates the arrival time at El Paso of the redispatched train, and columns F, G and H are computations, or observations made as a result of the comparison of columns C and E. For instance, in [fol. 3302] the first line the redispatched train arrived in El Paso in advance of the time that the actual train arrived by the amount indicated in column F. The second and third trains arrived at El Paso at the times indicated in column C, but on the redispatch the perishable blocks Y257 and Y258 arrived at El Paso as one train at the time indicated in column E. The comparison between arrival times then of the two trains actual against the one train redispatched is shown in column F; the first train arriving somewhat in advance of the second train resulted in the differences as shown in column F.

Q. Do I understand that in the redispatch where you show these parentheses following the block identification, that two blocks which moved in separate trains in actual operation moved in one train in the redispatched operation as they arrived at El Paso?

A. Yes, the parentheses indicate when that occurs.

Q. And where you have a single arrival time at El Paso of two blocks indicated by parentheses that aga indicates

that the blocks were consolidated into a single train for the [fol. 3303] purposes of the operation into El Paso?

A. That is right.

The Court; Were any of these operations over the south line through Douglas?

A. No, sir. I have been discussing those blocks which arrived in El Paso in advance of actual performance. Column G contains instances when the redispatched trains arrived in El Paso later than in actual performance, and column H indicates instances when the redispatched and actual trains arrived at El Paso at the same time, and when that occurs the word "same" is used.

Mr. Mason: Then, in obtaining the summary on the first sheet, did you first of all count from the actual train sheets the number of trains which were moved?

A. Yes.

Q. With perishable or manifest sections in them?

A. That is right.

Q. And likewise count the number of redispatched trains which carried the same perishable or manifest sections?

A. That is right.

Q. Those are the figures appearing in lines 1 and 2 in each of the blocks June and August, 1938, in the sum[fol. 3304]mary?

A. Yes. The amount of consolidation that was performed is evident from the difference in figures in lines 1 and 2.

The Court: What do you mean by "Ice House Arrival" on these sheets?

A. The trains arriving at El Paso in June usually went to the ice house where the trains received servicing, which is located about two miles west of the Union Station in El Paso.

Q. And you used that point as the point of destination for the purposes of this study?

A. Yes, and the point of comparison; but in August the ice house was not operated, and arrival time of the trains was taken in the yard at El Paso. In that case the time of arrival is taken from the train sheets for August where it is shown down in the yard. The time of arrival at the ice house in June is taken from the conductor's delay reports.

[fol. 3305] Mr. Mason:

Q. In each case where you make comparisons of arrival times between actual and redispatch, are you comparing arrivals at the same point in El Paso whether ice house or yard office?

A. Yes.

Q. As to line 4 and its subdivisions in each of the blocks on the summary sheet, sheet No. 1, is that a summarization of the information which appears in columns F, G, and H?

A. Yes, that is a count, just an item count of the items indicated in those columns.

Q. Is line 5 and sublines A and B worked out the same way by aggregating the totals of advance or later times, as the case may be?

A. That is right.

Q. How did you arrive at the information on line 6?

A. That is a mathematical computation, dividing the figure in line 5A by the figure in line 4B.

Q. And the same process as to line 7?

A. Yes, that is the division of 5B by 4C.

Q. Do all of these times which are shown in line C and E check against the dispatchers' train sheets or the time returns and delay reports, as the case may be?

A. Yes.

[fol. 3306] Q. How do you obtain the time of arrival at the ice house at El Paso of redispatched trains for which there were no time returns and delay reports?

A. That was a part of the redispatching operation. The dispatcher performing that work set the actual train performance against the redispatch train performance.

Q. He moved these particular redispatched trains which in actual operation had been moved to the ice house before going to the yard and he also moved the redispatched trains with the same blocks in them to the ice house?

A. Yes.

Q. And took his time of arrival at the ice house?

A. That is right.

Q. Are there any particular details of sheets two to six, inclusive, which have not been already referred to which require further explanation? I notice, for example, on sheet No. 3 you show a double cross-reference there. Is

that the same engine failure on the 19th which was referred to in your exhibit No. 222?

A. Yes.

Q. Has the exhibit been compared and checked through [fol. 3307] out?

A. Yes.

Q. Will you say whether or not it is a true and correct representation of the underlying sources?

A. It is.

Q. Have the computations all been checked?

A. Yes, I did that checking myself.

Q. Will you state the purpose of the exhibit?

A. To demonstrate the result of removal of interference in permitting arrivals at El Paso on the redispatch operations in advance of arrivals at El Paso on actual operations.

Mr. Mason: Have you any questions, Mr. Strouss?

Mr. Strouss:

Q. This time of arrival at the ice house, was the same time allowed the redispatched train in the yard movement as the actual train took or was there a redispatched movement of the train after it arrived in the yard?

A. The ice house is at the west end of the yard, there is no yard movement involved in this.

Mr. Strouss: I was wondering why you use in some instances the yard arrival and in other instances the arrival at the ice house?

A. Depending on whether the actual train went to the [fol. 3308] ice house or to the yard. We sent our redispatched train to the ice house or to the yard according to what had happened in actual performance.

Mr. Strouss: If the arrival shown here is not at the ice house, that means that the train never went to the ice house?

A. Yes.

Mr. Mason: Perhaps you should explain it a little more fully, Mr. Sines.

Q. Is the ice house on the direct line from the west as trains move toward the center of El Paso?

A. Yes.

Q. And a short distance east of the bridges across the Rio Grande River?

A. That is right.

Q. Is it a fact that trains may go either direct to the ice house as they come to El Paso or by-pass the ice house and go to the yard?

A. That is right.

Q. If they go to the ice house direct, they go to the yard later, is that correct?

A. Yes, sir.

The Court:

Q. Mr. Sines, referring to your cover page of exhibit [fol. 3309] No. 227, particularly to line 3 of June operations and line 3 of August operations, I take it from those figures that in your redispatching study it is possible to combine blocks?

A. What has happened there is indicated on the following sheets by the word "Part" and comes about because at Yuma it is necessary to cut blocks in two or more parts sometimes in order to comply with the 70-car limit. On our redispatch operation it was necessary to cut those blocks in parts less frequently. We could take a train as it arrived from California and dispatch it east without cutting a block in two.

The Court: You might clarify the mind of the Court if you would define the term "block." I recall distinctly the testimony with reference to the Phoenix block and the Yuma block and the Colton block, but what I am concerned with now is what constitutes a block as applied to your actual train operation.

A. Blocks originate for our purposes on this southern route at Colton, California, and again at Yuma. Block numbers are given to the train loads of P. F. E. cars departing from Colton and at that time one block number is assigned to all P. F. E. cars in that particular train. [fol. 3310] Thereafter the cars that left Colton on that train are kept track of and traced by means of that block number no matter how many times the block may be broken up.

The Court: I believe that answers the question.

A. The same thing applies to trains that come from the valley into Yuma.

Mr. Mason:

Q. You mean from the Imperial Valley?

A. Yes.

Q. You stated that blocks originate at Colton and Yuma. Your exhibit No. 227 for identification shows also an "A" block. Do you recall the testimony regarding the block from the Salt River Valley?

A. That is right.

Q. They originate at Phoenix, do they not?

A. That is right.

Q. And come into this picture at Tucson?

A. That is right.

Q. Have you an example on sheet No. 2 of the Yuma or Y block being broken up in actual operation on June 9th?

A. The first one indicated by the word "Part" is an example.

Q. Does that indicate that part of Y-276 went with Y-275?

[fol. 3311] A. Yes.

Q. And the other part with Y-277?

A. That is right.

Q. Whereas in redispatch operation the Y-276 was not broken up at all?

A. Yes. A moment ago I said sometimes it was necessary to break them up to comply with the law but there is an instance, the first one, of where in order to fill the train out to 70 cars it was necessary to cut the block in half, to cut 276 in half. That filled Y-275 out to near 70 cars, but then the part of Y-276 that was left over went forward with Y-277, filling that train up.

Mr. Booth:

Q. What happened on the redispatch on that block?

A. That block was not broken up on the redispatch but went forward intact with block Y-277.

The Court: The term "block" is only used as applied to perishable products?

A. That is right.

Q. And all of the cars containing perishables that are made up into one train at these points that you have heretofore indicated constitute a block?

A. Yes, sir.

[fol. 3312] Q. And is given a specific number so that any car of perishables from that original train carries that number on through to its destination?

A. That is right.

[fol. 3313] Mr. Mason: Mr. Sines, does the breaking up of these blocks into parts in order to move on separate trains, as you indicated, involve additional switching at Yuma or any other point where the break-up may occur?

A. Yes, that requires more switching than would otherwise be necessary.

Mr. Mason: Are there any further questions from the Court?

The Court: No.

Mr. Mason: We offer the exhibit No. 227 for identification in evidence.

Mr. Strouss: The same objection as to Exhibit 221, it is immaterial, calls for the conclusion of the witness, purely speculative.

The Court: The objection is overruled. It may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 227.")

Mr. Mason: Have you an exhibit before you now, Mr. Sines, bearing the title "Arrival Time at Yuma, Arizona, of 'SSW' and 'GBW' Westward Manifest trains—Actual Operation Compared with Redispatched Operation, With No Restriction and Using AC Power and Long Sidings, Months of June and August, 1938."

[fol. 3314] A. I have.

Q. Being in four sheets?

A. Yes.

Q. Did you prepare this exhibit or cause it to be prepared?

A. It was prepared under my direction and supervision.

Q. And from what sources was it prepared?

A. From the actual and redispatched train sheets.

Q. Were the conductors' time returns and daily reports used?

A. Not in this exhibit, because we have the arrivals at Yuma indicated in all instances on the train sheets.

Q. Was this exhibit prepared in the same manner and along the same lines as Exhibit No. 227?

A. Yes.

Q. And, I take it that this relates to the westward movement of identified or scheduled trains in the same manner as No. 227 relates to the eastward movement?

A. That is right.

Q. There are no ice-house or other arrivals except at the destination or the yard office at Yuma involved here? Are there?

[fol. 3315] A. That is all.

Q. I take it that the first sheet is a summary sheet of the same type as the first sheet of exhibit 227 and that the details are shown on sheets 2, 3 and 4?

A. Yes.

Q. Will you go to sheet 2 and take an example on that sheet and explain just what was done.

A. The arrival time of the first train is shown in column C and the date of arrival is shown in column A. The identification of the train is shown in column B; the same identification appears in column D, and the arrival of the redispatched train is indicated in column E. The actual and redispatched trains arrived at Yuma at the same time, which fact is indicated by the word "same" in column H. On that same day the GBW arrived at Yuma on the actual and redispatched at different times, and the result of that comparison is given in column G. In column F, the fourth train, we have an example of a train arriving at Yuma at different times on actual and redispatched, with the redispatched arrival in advance of the actual arrival. Consolidations on this exhibit are indicated again as they were on the previous exhibit, 227, and the computations were [fol. 3316] performed in exactly the same manner as the previous exhibit 227.

Q. The totals and averages in lines 5, 6 and 7 are worked from the proper columns of sheets 2, 3 and 4 in the same way?

A. Yes.

Q. Will you state the purpose of this exhibit?

A. The purpose of this exhibit is to indicate what the removal of the interference of the Arizona Seventy-Car Limit Law would permit in the way of early arrivals at Yuma to westbound manifest trains.

Q. Has the exhibit been compared and checked against the underlying sources?

A. It has.

Q. Will you say whether or not it is true and correct?
A. Yes.

Mr. Mason: Have you any questions?
Mr. Strauss: No.
Mr. Mason: Has the Court any questions?
The Court: No.
Mr. Mason: We offer the exhibit in evidence as No. 228.
Mr. Strauss: The same objections as to the previous exhibit.
[fol. 3317] The Court: I will overrule the objection. It may be admitted.

(Thereupon the document referred to was received in evidence and marked "Defendant's Exhibit No. 228.")

The Court: Now, Mr. Sines, do you have any perishables going west? I mean under these operations in June and August?

A. No, I don't suppose we have a western perishable movement of any volume at all.

Q. You use the expression "blocks" here. Now, in your westward movement, I thought I understood you, that that only applied to the perishables?

A. Well, I suppose that that is because the word "blocks" is shorter than using the term "manifest section."

Q. Well, then the term "block" is not exclusively applied in railroading to the perishables?

A. Well, about 99 per cent of the time it is, your Honor. They have the same significance, however, both the word "block" and "manifest section" in that it involves a group of cars as to which particular attention is being paid regarding schedule performance and keeping track of the progress of the cars in those blocks or sections.

The Court: Well, now, if you had a train load of empty refrigerator cars going west, would you term that a block [fol. 3318] or a manifest?

A. That would be neither a block nor a manifest, that would just be a drag. The PFE Company just keeps track of the movement of their loaded cars in blocks.

The Court: You may proceed.

Mr. Mason: Generally speaking, Mr. Sines, blocks and manifest sections which are treated on exhibit 228 are the

loads moving west under schedule in the manifest trains, are they not?

A. That is right.

Q. This does not undertake to treat of the movement of westbound empties?

A. No.

Q. As such?

A. No.

Q. I will ask you to refer, if you will, please, to a statement in one sheet entitled "Redispatch Study Wage Data?"

A. Yes.

Q. "Yuma, Arizona to El Paso, Texas for Period June and August, 1938."

A. Yes.

Mr. Mason: May we have this statement marked defendant's Exhibit 229 for identification?

The Court: It may be marked.

[fol. 3319] The Clerk: Defendant's Exhibit 229.

Mr. Mason: Did you prepare or supervise the preparation of this exhibit, Mr. Sines?

A. I supervised the preparation of the exhibit and assisted in a large part of it.

Q. From what sources was it prepared?

A. The information in columns A, B, and F was taken from the white work sheets A, and the information in columns C, D, E and G, G, H, I, was taken from the white work sheets A, information shown in columns J, K, L are computations of the figures in columns C, D, E, and G, H, I.

Q. Now, those lines which are identified severally throughout the exhibit as saving for a period, or increase for a period, are those computations subtractions from the lines immediately above them?

A. Yes.

Q. Now, getting at the basic and variable wages actually paid to trainmen and enginemen, I take it those were from the white work sheet A entries explained by Mr. Garverick?

A. That is right.

Q. Which in turn were taken from the time returns and delay reports rendered by the conductors or engineers?

[fol. 3320] A. Yes.

Q. As to the basic wages for the redispatched trains for trainmen and enginemen, those again were entered on the white work sheets A, were they?

A. Yes, the basic wages.

Q. How did you arrive at the variable wages so called here?

A. The variable wages were treated as lump sums and are computations based upon the percentage reduction and train-miles actual against redispatched, with the exception of certain continuing items which we knew would continue at the same volume without relation to length of trains, such items as station switching at Gila, which is done by road crews, and station switching at Lordsburg, which is done by road crews, and which is not affected one way or the other by length of trains, were continued at the same level; but other items involving overtime, initial switching, terminal switching, and held-away-from-home terminal time, were reduced in the ratio of the train-mile reduction.

Q. Those items vary with the amount of the train-service performed measured in train-miles?

A. Yes, with the opportunities for their accumulation. [fol. 3321] Then, I take it, referring to the Yuma-Gila block, that the amount of variable wages shown for trainmen for the redispatched represents the relationship of the redispatched train-miles to the actual train-miles, and bears the same proportion to the variable wages for the actual operation as the redispatched train-miles do to the actual train-miles, subject to the explanation that you made as to the continuing level of the amounts paid for station switching at Gila?

A. That is right, and Lordsburg.

Q. Well, Lordsburg wouldn't be involved in the Yuma-Gila block?

A. That is right.

Q. And the same explanation would apply to the reduction of variable wages for enginemen from the figures shown for the actual and the figures shown for the redispatched?

A. Yes, and there the computation is based on locomotive-miles.

Q. In the case of enginemen, the computations are based on locomotive miles?

A. Yes.

Q. As shown in column F?

A. Yes.

[fol. 3322] Mr. Mason

Q. Now as to the figures in block VI, total North Line, are those simply the additions of the figures appearing above for each of the separate blocks?

A. That is right.

Q. These totals of basic variable and total in columns J, K, and L, are those cross-totals as well as vertical totals?

A. Yes, sir.

Q. Do you bring the total showing for both North and South lines together?

A. In block XI.

Q. That represents in block XI the totals for the actual and the redispatch operations for both lines and the differences between the two in the line identified as "Saving for period"?

A. That is right.

Q. What operation is undertaken in obtaining the figures in block XII?

A. We expanded the two months' showing to an annual basis using the ratio indicated, whose derivation is shown in the block at the bottom of the sheet.

Q. That is, you obtained the figure for the year by comparing the total traffic in gross ton-miles for the two months with the total traffic in gross ton-miles for the year?

[fol. 3323] A. Yes.

Q. I think you have explained these figures before in connection with the previous exhibit, No. 226. Are these the same figures which appear in the block on the second page of exhibit No. 226?

A. They are.

Q. Are these the same figures of trains, train-miles, and total locomotive-miles which appear on that exhibit?

A. Yes.

Q. How do you arrive at the figure shown in line 13?

A. During 1938 the combined railroad retirement and unemployment insurance tax rate was 5.75 per cent, but those percentages apply to salary payments only up to $300 per

month. Over that there was no tax so we investigated a considerable number of payments to trainmen and enginemen—I just forget how large a volume of figures we worked with—and developed that for trainmen the combined retirement and unemployment insurance tax was 5.65 per cent instead of 5.75, the one-tenth of one per cent difference being due to the fact that some of those trainmen received more than $300 per month.

Q. And the excess over $300 per month was exempt from [fol. 3324] tax in this case?

A. That is right. A similar computation was made for enginemen and there were more enginemen getting over $300 a month than trainmen so it brought that percentage down to 5.44.

Q. Do I understand that the application so far as conductors and trainmen are concerned of 5.75 per cent on the total compensation up to $300 in any one month is equivalent to the application of 5.65 on the total compensation including that above $300 a month?

A. That is right.

Q. That is how you got this figure?

A. Yes.

Q. A similar explanation would be correct as to the 5.44 percentage figure for enginemen?

A. Yes. Then we applied those percentages in columns E and I and added them to the saving figure in block XII to produce the grand total saving in line 14.

Q. Are all of the figures of wage payments shown on the exhibit down to and including block XII exclusive of these Federal taxes?

A. They are, because they are not shown nor computed on the time returns and delay reports. That is done after the timekeeping is done on the paycheck and it is done in [fol. 3325] lump sum computation just as it is on this exhibit here.

Q. Does the company pay this tax to the Federal government or to the railroad retirement board as a lump sum payment on its entire payroll exclusive of compensation of over $300 per month to any one person?

A. I am sorry, I don't know just how we handle that after we get past the timekeeping stage.

Q. Will you say whether or not it is a Federal payroll tax paid by the company?

A. Yes, it is.

Q. And is in addition to the wage payments and not deducted from them?

A. That is right.

Q. Do you know and, if so, will you state whether there is in addition a deduction from the wage payments made for account of each employee and paid directly to the Federal government?

A. That is right, each employee makes a contribution to those funds also.

Q. To the retirement fund but I think not to the unemployment fund?

A. You are right.

Q. That is not included in this account at all?

A. No.

[fol. 3326] Mr. Mason: Have you any questions on the exhibit, Mr. Strouss?

Mr. Strouss: Not at present.

Mr. Mason: Has the exhibit been carefully checked, Mr. Sines, with the underlying sources?

A. It has.

Q. Have the computations been carefully checked?

A. They have.

Q. I take it that line 12, column L, represents the amount of monetary payments of wages to employees which would be saved on the annual basis as computed here and that the figure in line 14, column L, represents the total of payments for account of wages and payroll taxes on those wages which would be saved by the company under the circumstances contemplated by this exhibit?

A. That is right, yes.

Mr. Mason: Has the Court any questions?

The Court: No questions.

Mr. Mason: We offer it in evidence as defendant's exhibit No. 229.

Mr. Strouss: The same objections as to the previous exhibits.

The Court: Objections overruled, it may be admitted.

(The document referred to was received in evidence and [fol. 3327] marked "Defendant's Exhibit No. 229.")

The Court: Mr. Sines, for the moment referring to that same exhibit, in column A, if I recall the previous testimony,

you are taking a train from Yuma to El Paso through the four divisions or districts indicated, which would be classed as four trains rather than one train?

A. That is right.

The Court: We will take our morning recess at this time.

(Thereupon a short recess was taken, after which proceedings were resumed as follows:)

Mr. Mason:

Q. Mr. Sines, have you a statement in one sheet entitled, "Los Angeles, California, to El Paso, Texas, Passenger Redispatch Study for the Year 1938," etc.?

A. Yes.

Mr. Mason: May we have this exhibit marked as "Defendant's Exhibit No. 230" for identification?

The Court: It may be marked.

The Clerk: Defendant's exhibit No. 230 for identification.

Mr. Mason:

Q. Did you prepare this exhibit, Mr. Sines?

A. Yes.

Q. From what sources?

[fol. 3328] A. From the white work sheets A which were used to make the passenger redispatch studies for the year 1938.

Q. Does this cover the entire year 1938?

A. It does.

Q. What does this reflect as to passenger train operations during the year 1938?

A. It indicates the additional and extra passenger train service which we determined was brought about by observance of the Arizona 14-car limit law.

Q. Contrasting the passenger train redispatch study with the freight redispatching study, why is it you are able to make the study of the entire year according to the appearance of the exhibit comparatively much more simply and easier than in the case of the freight redispatching study?

A. In the case of a passenger redispatching study it is much easier to indicate what would have been done if the 14-car limit law had not been operative. For instance, take the simplest example, a train comes to Yuma with 15 cars none of which can be set out but which must move forward

on the schedule of that train. It is then necessary to provide a second or extra section to handle that one car to its destination if it be in Arizona or across the state to Lordsburg if it be east of Arizona. It is very easy to say if there had not been a 14-car limit that train could have gone through Arizona handling 15 cars and we could point our figure accurately and exactly at that extra section and say "That is the train which would have been eliminated," but with a freight redispatching study where a day's business is handled in fleets of trains, fleets of six, seven, eight, or nine trains per day, all of those trains observing the 70-car limit and their redispatching that business in a fewer number of trains, it is impossible to point your figure at any one train and say "This is the train that would have been eliminated." All you can do is say that the actual operation amounted to nine trains and the redispatch operation amounted to six or seven trains, and there would have been saved two or three trains; and you get at the difference by subtraction instead of by actual determination.

The Court: You don't mean to infer from that that in actual operations where you might bring 15 cars to Yuma from Los Angeles that you would actually run a separate section of that train across the state with only one car?

A. Yes.

[fol. 3330] Q. That is actually done?

A. Yes, sir.

Mr. Mason:

Q. In actual practice, Mr. Sims, if you had 15 cars, would you run two sections of eight and seven or something like that instead of fourteen and one?

A. In the year 1938 I have known where both occurrences happened. We handled one car in our extra section and fourteen cars in the regular section. The reason for that is you cannot take one Pullman car and take it away from the diner because you have to feed your passengers. You cannot take an observation car off a train very well because you have advertised to the passengers that they are going to have an observation car to use, so you will take a head-end car with mail or express that has to move on that schedule or that has the passengers' baggage and other equipment in it and you make a train out of that head-end car. On a short trip where they don't need a diner you might run

a two car train with a passenger car and a buffer. In that event it means you are subjecting yourself to the additional expense of hauling that additional buffer car.

Q. Referring to exhibit No. 230 for identification, will you take some of these examples and explain just what you have [fol. 3331] done here?

A. All of these examples are listings of the second and extra sections of the trains identified in column A which were determined by means of our study would be necessary to run.

Q. Taking the first example, was there an extra section of train No. 2 operated from Yuma to El Paso via Phoenix and Bowie?

A. There was.

Q. Which made the number of train-miles shown?

A. Yes.

Q. By your study with the dispatchers' actual train sheets and the white work sheets, you determined that that train extra section could have been eliminated?

A. Yes, because of the increased number of cars which would have been handled from Tucson east to Lordsburg, we would have provided a helper for that larger train out of Tucson and incurred the additional expense indicated in column F in order to eliminate the necessity for an extra train the entire distance across the state.

Q. In other words, the locomotive-miles in column F identified with the letter "O" are light and helper miles which would have been run on the consolidated train which were [fol. 3332] not run on the two separate trains within the 14-car limit?

A. That is right.

Q. And are an offset against any saving of locomotive-miles that would have been made by running one instead of two trains?

A. That is right.

Q. Do you get the total in column G by subtracting the figure in column F of the line representing train No. 2 from the total locomotive-miles shown in column E for that particular train?

A. That is right.

Q. And the same way as to the second one?

A. Yes, occasionally, or it is more often than occasionally, in running these additional or extra sections we run one more train in one direction or one more train than we have

scheduled as an everyday occurrence in one direction than we do in the other direction and that means that we have to balance passenger engines and the engine crews and the passenger train crews in the same manner as we have described for freight operations in order to get them over to the point where they will be required for service or return them to their home terminals after they have completed their service. In that event, by eliminating this extra section we have also eliminated the necessity for paying these crews [fol. 3333] for the dead-head movement in the case of the train crews and the double-head movement in the case of the engine crews and we will also eliminate the locomotive mileage in both directions even though the train itself only sees service in one direction. The additional locomotive-miles over and above the locomotive-miles during which time the locomotives are handling the train are indicated in column F also.

The Court: Do I understand you to say in your normal operations now there is an unbalance of both power and men due to the fact there is a greater movement in one direction of passengers than there is in the other?

A. Did you say "normal"?

The Court: Yes.

A. No, the normal situation is that we have four passenger trains in each direction through Arizona each day.

The Court: What did you mean when you referred to an unbalance?

A. When we run one additional train in one direction, we then have five passenger trains in one direction and four passenger trains in the other direction.

The Court: And that is what creates the unbalance?

[fol. 3334] A. These additional and extra sections caused by the Arizona 14 car limit law.

Mr. Mason:

Q. You mean where an extra section of a train is run because you have fifteen or sixteen cars in one direction and only fourteen in the other on some particular day or pair of days?

A. Yes, under the circumstances I have described.

Q. And the circumstances studied in exhibit No. 230?

A. Yes.

The Court:

Q. However, if it happens that on that same day in the opposite direction you also had a long train, there wouldn't exist this unbalance that you mention?

A. Not necessarily, that is right.

[fol. 3335] Mr. Mason: If your eastward long train happens to be moving over the south line, and the westbound long train happens to be moving over the north line, you would have a double unbalance, wouldn't you, Mr. Sines?

A. That is right.

The Court: We are now getting into the theoretical.

The Witness: No, you are talking about actual conditions that we have to meet every day, and it also depends, to some extent, upon seasons. During the Christmas season we will have long trains or extra sections running in both directions which will cancel out.

The Court: With your passenger trains, Mr. Sines, running from Yuma to El Paso, do you count that as one train, or do you count it as you do your freight train, one train for each division or district through which it operates?

A. I didn't attempt to define that, your Honor. I just said that that happened so many times.

The Court: Well, I undersand that this exhibit doesn't refer to it, but I am asking you now, in the other exhibits let us say that may be in evidence here, how was it designated, the passenger trains, or do we have any such?

[fol. 3336] Mr. Mason: We have such an exhibit; yes, the exhibit No. 220 has a train count on it.

The Witness: There are no passenger trains on there, are there, 220? Yes, you are right, and in that event the passenger trains on exhibit 220 have been counted once on each freight district.

Mr. Mason: In the same manner as the freight trains were counted?

A. Yes, but as far as any passenger studies are concerned, I have not identified them as trains by any kind of an arbitrary count.

Q. I should like to have you, on exhibit 230, explain this offset of 150 motor-car-miles. How does that come about?

A. That is indicated by the note alongside of the item at the bottom of the sheet and was brought about by elimination on our redispatch of a section which operated through Phoenix, but which had some Phoenix passengers on it.

Q. You say operated through Phoenix?

A. Yes. When we took the train off through Phoenix, it meant that the equipment went through Gila. In order to get those passengers up to Phoenix we said, "We will run a motor car down to Picacho to pick them up and take them to Phoenix."

Q. And that accounts for the 75 miles of motor car oper- [fol. 3337] ation light from Phoenix to Picacho, and loaded from Picacho to Phoenix?

A. Yes, sir.

Q. Mr. Sines, as I recall it, your passenger operations as distinguished from your freight operations, that your 1938 redispatching study as well as the actual operations for the passenger cover the entire year, whereas for the freight it only covered the months of June and August?

A. That is right.

Mr. Strouss: I didn't understand where that motor car operation appeared in there.

A. The note at the bottom, and it doesn't appear in any of the totals above there.

Mr. Mason: Have you any other comments on this exhibit, Mr. Sines, prior to its offer?

A. No.

Mr. Mason: Have you any further questions, Mr. Strouss?

Mr. Strouss: I was trying to see where this is different from Exhibit 199.

Q. Exhibit 199 would include this, but in addition, other interferences?

A. Yes, sir. This information on 230 is an operating statistics exhibit to develop the quantities necessary to make an estimate of the money which could have been [fol. 3338] saved, but the other exhibit that you speak of, No. 199, is an interference exhibit.

Q. Now, what is this item, "Indio Helper Service?"

A. When the two trains, 43 and 5, operate through Tucson westbound, either one of those trains would have more than fourteen cars west of Tucson or either one of them would pick up west of Tucson so as to increase their consist over fourteen cars if it were permissible. It is the practice to take the cars off one train and put them on the other train if the second train has available space under the fourteen car limit to permit it. We reroute the cars and reassign the cars to the other train. This may mean that both trains will leave Tucson with fourteen cars and that they will go through to Yuma with fourteen cars. Now, operating west from Yuma to Los Angeles, it is our practice to furnish helper service for passenger trains of over ten or eleven cars——

Mr. Mason: Between what points westward?

A. Between Indio or Garnet and the top of the hill at Cabazon.

Q. Banning?

A. Banning.

[fol. 3339] Q. Is that the Beaumont grade?

A. Yes.

The Court: Is that to enable them to maintain their schedule?

A. Yes.

Q. The locomotive could pull the train but not maintain its schedule, or is that a matter of contract with the brotherhoods?

A. Oh, no; I don't know whether they could get up there with fourteen cars or not, but it assists in maintaining schedule, yes. We don't reswitch those trains at Yuma because of the time and inconvenience that would be necessary, but let both those fourteen-car trains go over to the bottom of the helper grade, and then it means that both those trains will have to have a helper to assist them up the hill. Now, if it had been possible originally at Tucson to permit one train to go out with ten or eleven cars and the other train to go out with fifteen or sixteen cars, only one train would have required the helper, and the other train could have gone single. We had several instances in 1938 where both trains, under the circumstances I have de-

scribed, required helpers but where reconsisting the trains made it possible to eliminate the helper on the second train, [fol. 3340] and we have accounted for that on this exhibit.

Mr. Strouss: No more questions.

Mr. Mason: We offer the exhibit in evidence as Defendant's Exhibit 230.

Mr. Strouss: The same objection as to the previous exhibits.

The Court: The objection will be overruled. It may be admitted in evidence.

(Thereupon the document referred to was received in evidence and marked "Defendant's Exhibit No. 230.")

Mr. Mason: Have you before you, Mr. Sines, an exhibit in one sheet entitled "Los Angeles, California, to El Paso, Texas, Saving in Passenger Train Service and Costs Account Discontinuance of Fourteen Car Limit on Passenger Trains in Arizona, Year, 1938?"

A. I have.

Mr. Mason: May this be marked Exhibit 231?

The Court: It may be marked.

The Clerk: Defendant's Exhibit No. 231 for identification.

Mr. Mason: From what sources was this exhibit prepared, Mr. Sines?

A. This was prepared from information shown on Exhibit 230 as to train and locomotive-mile savings and I [fol. 3341] have applied against those mileage the costs shown in our form 521 for passenger service for the year 1938, as to items in 3D, 3E, and 3F, the items of fuel, enginemen's wages and trainmen's wages is taken directly from the reports regularly made as the result of the operation of those trains. A special computation was made with respect to the fuel item to separate the fuel consumed by the engine as contrasted with the fuel consumed by the trailing load.

Q. And are all these computations either taken directly from the reports of the wages or, as the case may be, from form 521?

A. Yes.

Q. The figures I notice for fuel and so forth, particularly for fuel, rather, between Los Angeles and Yuma are

different than those between Yuma and El Paso. Is that because of a difference in the figures reported in form 521?

A. Did you say the fuel?

Q. Yes.

A. Well, that is because I had the fuel separated by the Fuel Bureau at Yuma to give me the fuel consumed by trains west of Yuma and the fuel consumed by trains east of Yuma and then after I made the split of fuel between [fol. 3342] locomotive and trailing load, the fuel consumed per locomotive-mile was greater west of Yuma than it was east of Yuma.

Q. Then that accounts for the difference in unit cost between the districts west of Yuma and east of Yuma?

A. That is right.

Q. Now, this is entirely addressed to the train or locomotive miles saved rather than in comparison with the total operated and the total which would have been operated?

A. That is right. An explanation should be made with respect to the cost of gasoline motor car operation, the expense figure indicated there in line 8 comes from a statistical statement prepared by our accounting department covering the cost of operation of motor cars similar in form and substance to the form 521. I have a copy of that motor car statement here, which I can give Mr. Stronss.

Q. This is simply a unit cost developed in the same fashion as the unit costs which are developed on form 521?

A. Yes.

Q. And all of these unit cost figures relate to the forms 521 for the year 1938, do they?

[fol. 3343] A. Those which I have mentioned, except 3A, 3B and 3C, which are direct segregations.

Q. Has the exhibit been compared against these underlying sources to determine its correctness?

A. Yes.

Q. Are there any other computations other than those which appear on the face of the exhibit which you have not already explained?

A. Well, yes. There is especial consideration given to the out-of-pocket cost feature from this viewpoint: The cost of fuel, enginemen and trainmen items is charged out at 100 per cent of its value, engine house is charged at 43 per cent of the unit cost figure shown on form 521, other locomotive supplies are charged at 100 per cent, and locomotive repairs are charged at 80 per cent. The reasons for

reducing the engine house and locomotive repairs to percentages less than one hundred is that in eliminating occasional operation such as this, the expense of supervisory forces and some of the labor expense will continue even though the locomotive-miles themselves be reduced. We won't cut down our foreman's expense, for instance, in the roundhouse because we don't operate a particular passenger train.

Q. The same way as to locomotive repairs, there will be [fol. 3344] some stand-by expense which will not be eliminated even though the locomotive-miles are eliminated, occasionally eliminated as you say?

A. That is right, and the percentages that I have mentioned are percentages that we have developed in the Bureau of Transportation Research and which I have used for a number of years.

Q. By charging these expenses at a percentage figure rather than a total of 100 per cent, do you reduce the amount indicated as a saving or do you increase it?

A. I reduce it.

Mr. Mason: Have you any questions on the exhibit, Mr. Strouss?

Mr. Strouss: Yes. I am not quite certain that I understand that 3A, 3B and 3C. 3B and 3C, if I understand you correctly, you have taken the actual figures of wages paid out, actual wages paid out?

A. Yes, to the men manning the particular trains which we say would be eliminated.

Q. Now, in 3A, Fuel, you didn't use the unit cost which you have set up in your form 521?

A. No, we went to our Fuel Bureau and had them give us the amount of the fuel consumed by every one of these particular extra sections.

[fol. 3345] Q. On the particular engines used on those operations.

A. Yes, and that gave us the fuel for the movement of the locomotive and cars. Now, most of these cars would go ahead anyway regardless of the fact that we cut the train off, so, in effect, all that we do is to eliminate the operation of the locomotive and these buffer cars that I speak of, so I made this computation to split the fuel as between locomotives and cars and that is the resulting unit figure that I have shown on the exhibit.

Mr. Mason: That represents the fuel required to move the locomotive apart from the cars?

A. Yes.

Q. You figures that you only saved the locomotive-miles and not the car-miles?

A. That is right.

Mr. Strouss: In other words, in the actual train, if these cars had remained in that train there would have been additional fuel in order to move those cars in the actual train?

A. That is right.

Q. And you have made an allowance here for what that additional fuel would have been in the actual operation, and this then would bring it down to what you consider the [fol. 3346] fuel necessary to move the locomotive alone?

A. That is right.

Mr. Strouss: That is all.

Mr. Mason: We offer the exhibit in evidence as defendant's Exhibit No. 231.

Mr. Strouss: The same objection as to the previous exhibits.

The Court: The objection is overruled. It may be admitted in evidence.

(Thereupon, the document referred to was received in evidence and marked "Defendant's Exhibit No. 231.")

Mr. Mason: Have you a statement before you, Mr. Sines, entitled "Passenger Redispatch Study—Year 1938, Los Angeles, California, to El Paso, Texas, Extra-Territorial Effect of Arizona Train Limit Law between Los Angeles, California, and Yuma, Arizona, and Arizona-New Mexico State Line and El Paso, Texas?"

A. Yes.

Mr. Mason: May we have this statement marked Exhibit 232?

The Court: It may be marked.

The Clerk: Defendant's Exhibit No. 232 for identification.

Mr. Mason: Did you prepare this exhibit, Mr. Sines?

[fol. 3347] A. I did.

Q. And from what sources?

A: The sources are indicated in the—source blanks are indicated in the body of the exhibit, the information is all taken from the preceding two exhibits, 230 and 231.

Q. You have a blank under block one of this exhibit. What figure should be filled in there?

A. Exhibit 231.

Q. And in the other blanks, what would that be, 230 and 231?

A. Yes.

The Court: At the bottom?

Mr. Mason: At the bottom under the asterisk what would that be?

A. 231.

The Court: You are asking that the exhibits filed with the clerk, that the numbers be inserted that you indicate?

Mr. Mason: Yes.

Q. Now, I take it that the figures under paragraph one are taken directly from the preceding exhibit?

A. Yes.

Q. How do you arrive at the figures in paragraph 2?

[fol. 3348] A. We computed the train-miles indicated on exhibit 230 from the Arizona-New Mexico state line to the end of the train runs shown on the exhibit. For instance, train No. 1 on exhibit 230 operated from El Paso, Texas, to Yuma, Arizona, via Bowie and Phoenix. From El Paso to the Arizona-New Mexico state line would be 171 miles, and that would be included in the figure on exhibit 232 as extra-territorial train-miles.

Q. Was the same detailed computation undertaken in connection with every other item on exhibit 230?

A. That is right.

Q. To obtain the additional train-miles?

A. That is right.

Q. There were no additional light or helper locomotive-miles?

A. Well, I did that from the train-mile basis because these light locomotive-miles don't always match up with the train-miles that are operated, so I stayed with the train-mile basis.

Q. Now, in pricing out these saved train-miles, you show by the asterisk, where are those figures?

A. Those figures come from line 3G, column C, where we find $9,397 as the saving in the territory Yuma, Arizona, to El Paso, Texas, and in line 1 we find 12,712 train-miles [fol. 3349] saved between Yuma, Arizona, and El Paso, Texas.

Q. And you obtain an average figure per train-mile for each train-mile saved?

A. That is right.

Q. And then apply that average figure to the extra-territorial miles that are saved?

A. That is right.

Q. Then I take it that line 3 is simply the addition of the three figures appearing directly above the total?

A. Yes, sir.

Q. Have the computations on the exhibit been checked?

A. They have.

Q. Is the exhibit true and correct as a reflection of the underlying sources?

A. It is.

Mr. Mason: Has the Court any questions?

The Court: No.

Mr. Mason: We offer the exhibit in evidence as defendant's Exhibit No. 232.

Mr. Strouss: The same objection as to the preceding exhibit.

The Court: The objection is overruled. It may be admitted.

[fol. 3350] (The document referred to was received in evidence and marked "Defendant's Exhibit No. 232.")

Mr. Mason: Take up the exhibit in a single sheet entitled "Redispatch Study—Operating Statistics, Tucson—Phoenix Month of December, 1938."

A. Yes.

Mr. Mason: May we have this statement marked No. 233 for identification?

The Court: It may be marked.

The Clerk: Defendant's Exhibit No. 233 for identification.

Mr. Mason: Did you prepare this exhibit, Mr. Sines, or supervise its preparation?

A. I supervised its preparation.

Q. From what sources was it prepared?

A. This was taken from the white work sheets A upon which Chief Dispatcher Cassady of the Tucson Division performed the redispatching study for the month of December, 1938, between Tucson and Phoenix.

Q. Were the original train sheets used in this connection?

A. Yes, the original train sheets were used to determine the actual handling.

Q. Were there any redispatch train sheets compared? [fol. 3351] A. No.

Q. Will you explain why not?

A. The reason for that is that there was one, or at the most two trains per day involved in each direction, and their operation could be indicated with enough detail on the white work sheets A to satisfy the requirements of the redispatching study.

Q. Is this an actual count from the train sheets and the work sheets of the statistics which are shown in columns A to E, inclusive?

A. That is right.

Q. I take it that the computation of cars per train is computed from the exhibit?

A. Yes.

The Court: This exhibit has to do wholly with freight operations?

A. Yes.

Mr. Mason: And this is the separate redispatching study or the result of the separate redispatching study of the Phoenix-Tucson line which Mr. Cassady mentioned in his testimony?

A. That is right.

Q. Will you explain why the month of December was taken, whereas in the other 1938 redispatching study June and August were taken?

A. June and August were the months chosen for the line [fol. 3352] Yuma to El Paso because those are the months which would best measure the maximum and minimum volumes of traffic passing through Arizona from California to eastern destinations, and from eastern destinations to California, and with the exception of December and one or two other months of the year, a very small percentage of

that through business gets up onto the Phoenix line. There are only operated on that line one local train in each direction each day, but during December and one or two other months of the year there is a perishable season in the Phoenix territory and two trains per day are operated out of that territory and sometimes three.

Q. Then did you select the month of December because that represents a heavier month on the Phoenix line?

A. That was the peak month for 1938 on the Phoenix line.

Q. Did the redispatching study indicate and, if so, will you state whether the 70-car limitation operated in any sense as a restriction upon operations during the month of December, 1938?

A. It did operate as a restriction in that it caused us to operate more trains, more train-miles and locomotive-miles than would otherwise have been necessary.

[fol. 3353] Q. Your exhibit No. 233, then, presents the result of that study, of that particular peak month on the Phoenix line?

A. That is right.

Q. Have you undertaken to evaluate this saving beyond presenting merely the amount of the train-miles and locomotive-miles that would be saved by non-observance of the law?

A. No, I have not.

Q. Do I understand that the train sheets and the white work sheets A for the month of December, 1938, have also been supplied to Mr. Strouss?

A. No, they haven't but they have been made available, and are subject to his call at any moment.

Mr. Mason: That was our understanding previously that they would be available upon your call, Mr. Strouss.

Mr. Strouss: Yes.

Mr. Mason: Have you any questions on Exhibit 233, Mr. Strouss?

Mr. Strouss: No.

Mr. Mason: Has the Court any questions on No. 233?

The Court: No.

[fol. 3354] Mr. Mason: We offer the exhibit in evidence as defendant's Exhibit No. 233.

Mr. Strouss: The same objections.

The Court: The same ruling. It may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 233.")

Mr. Mason: There is a feature of Exhibit 233 which you might explain, Mr. Sines. I notice the reference to the Phoenix Roustabout Service. Apparently, in the redispatching handling, there was an increase in the number of trains. How did that come about? What is the Phoenix Roustabout handling on the redispatched that didn't exist in the actual?

A. In making the consolidation of trains at Phoenix, that is, letting one train do the work that two had done to handle cars from Phoenix to Tucson, it was necessary to eliminate from local work on our redispatched long train between Phoenix and Tucson at stations immediately east of Phoenix, so we had to provide for a Phoenix roustabout to do that local work in the immediate vicinity of Phoenix. That would be quite a saving, however, because the roustabout, as indicated here, would only operate for 61 miles; [fol. 3355] whereas the train eliminated had operated about 120 miles from Phoenix to Tucson.

The Court: Where do you get that 61 miles the roustabout train would operate?

A. Dividing the 254 by 4.

[fol. 3356] Mr. Mason:

Q. You had four trains and you got a total of 254 train-miles?

A. Yes.

Q. A little more than 61, I think, four into 254?

A. All right, 63.

Q. Do you have anything further on exhibit No. 233?

A. No, sir.

Q. I think you have previously spoken of redispatching studies relating to the period in 1940, month of April of that year, when trains were operated on the Tucson division or in the state of Arizona to a certain extent without regard to the 70 car limitation?

A. That is right.

Q. Have you an exhibit showing the result of the redispatching of what may be called for convenience "1940 Long Train Period"?

A. I have.

Q. When I refer to the 1940 long train period, it will be understood that it means the period between April 4th and April 30th, inclusive, 1940?

A. Yes.

Q. First of all, the redispatching study which compares the actual operation of long trains during that period, of [fol. 3357] all trains during that period, with the operations as they would have taken place if the 70-car restriction had been fully observed. Have you an exhibit of that type before you?

A. Yes, sir.

The Court: In other words, we are now about to consider the reverse of what we have been considering up to date?

A. Exactly, we want to determine how much we saved during those twenty-seven days.

Mr. Mason:

Q. This is a case, to carry out the Court's suggestion a little further, this is a case of making short ones out of long ones where heretofore we have been making long ones out of short ones?

A. That is right. This is an exact duplicate of what we did in our Nevada Train Limit study.

Q. I want to refer to your exhibit No. 196. Is the subject matter which we are now approaching with your next exhibit associated with item No. 5 of exhibit No. 196?

A. Yes.

Q. Will you state the title of the exhibit which has just been distributed?

A. "Main Line Freight Trains of Various Lengths Operated between Yuma, Arizona, and El Paso, Texas, via [fol. 3358] Gila, Arizona, and Lordsburg, New Mexico, and via Douglas, Arizona, over South Line during Period April 4th to April 30th, 1940, inclusive, Actual Operation Compared with Redispatched Operation, Observing 70-Car Restriction and Using Present Power and Short Sidings."

The Court: You are waiving any right that this might incriminate the defendant in this case?

A. I am leaving that to counsel.

Mr. Mason: We understand that this is not a criminal prosecution, Judge; we believe it is preferable here to show

the facts. I imagine that the fact of the operation of these trains is not unknown to the Attorney General's office, but for reasons of its own the Attorney General's office chose to refer to only two trains in the complaint.

Q. Did you prepare or supervise the preparation of this exhibit, Mr. Sines?

A. It was done under my supervision and direction.

Mr. Mason: This exhibit, by the way, should be marked No. 234 for identification, if your Honor please?

The Court: It may be marked.

The Clerk: Defendant's exhibit No. 234 for identification.

[fol. 3359] Mr. Mason:

Q. From what sources was this exhibit prepared?

A. This was taken from the actual train sheets and the redispatched train sheets supplemented by information taken from the conductors' wheel reports and the conductors' time returns and delay reports.

Q. Has it been compared against the underlying sources which you just mentioned?

A. It has.

Q. Does this exhibit correspond to any exhibit previously presented in connection with the 1938 redispatching study?

A. Yes, it is a counterpart of exhibit No. 214.

Q. This, I take it, is simply a train count by train lengths of the trains as they were operated and as they would have been operated if the 70-car restriction had been complied with?

A. That is right.

The Court: Exhibit No. 214 covered the months of June and August, whereas this exhibit only covers the twenty-six or twenty-seven day period?

A. That is right.

Mr. Mason:

Q. Was this exhibit prepared in exactly the same manner as exhibit No. 214?

A. It was.

[fol. 3360] Q. And from the corresponding sources relating to the long train period of 1940?

A. Exactly.

The Court: There is this distinction though, is there not, between these exhibit No. 214 and No. 234; in fact as I recall it, your entire redispatching study and all of the exhibits that have been offered in connection therewith have been on the assumption that you had suitable sidings and suitable power to operate those redispatched trains?

A. That is right.

The Court: Whereas with exhibit No. 234, the sidings were as they actually exist and I believe you heretofore testified that the length of the period was such that you didn't feel justified in shifting the heavier power onto this line?

A. That is right.

Mr. Mason:

Q. In order to carry the distinction further, Mr. Sines, this is a comparison of operations as they were conducted without regard to the 70-car law but with the power and the sidings which were available in April of 1940?

A. That is right.

Q. As contrasted with operations as they would have been conducted if the law had been observed with the same power [fol. 3361] and the same sidings?

A. That is right.

Q. So that the only difference in the operating conditions as between actual and redispatched is the disregard of the 70-car law?

A. Yes.

Q. Is the exhibit true and correct as a reflection of the underlying sources?

A. It is.

Q. Have the computations been checked?

A. They have.

Q. I take it that the totals are as shown for each of these separate blocks or additions of the figures immediately above?

A. Yes.

Q. You haven't undertaken to present any showing of savings or increased operations, as the case may be, as achieved by the operation?

A. No, this is simply a train length exhibit, although savings are indicated in the totals where comparison may be made between the number of trains actually operated

and the number of trains that would have been operated had the law been observed as shown in the redispatch.

Mr. Mason: Have you any questions on the exhibit, Mr. Strouss?

[fol. 3362]. Mr. Strouss: No questions.

Mr. Mason: Has the Court any further questions?

The Court: No.

Mr. Mason: We offer the exhibit in evidence as defendant's exhibit No. 234.

Mr. Strouss: The same objections particularly as to the redispatch.

The Court: The objections are overruled, it may be admitted in evidence.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 234.")

The Court: The court will be at recess until two o'clock P. M.

(Thereupon the court stood at recess until two o'clock P. M., this day.)

[fol. 3363] January 30, 1941, two o'clock P. M.

The witness B. S. Sixes, was recalled to the stand, and proceedings were resumed as follows:

The Court: You may proceed.

Mr. Mason: Your Honor, the question was asked Mr. Sines as to the difference between the freight redispatching study and the passenger redispatching study, particularly as to the determination of the trains eliminated, and because his answer seemed at the time incomplete, we have had it written up to determine whether it read as we thought it read. I would like to have that answer made more complete. I think in your answer this morning, Mr. Sines, as it has been recorded, you said that "with a freight redispatching study where a day's business is handled by fleets of trains, fleets of six, seven, eight or nine trains per day, all of those trains observing the 70-car limit and then redispatching that business in a fewer number of trains, it is impossible to point your finger at any one train and say, 'This is the train that would have been eliminated.' All you can do is say that the actual operation amounted to

nine trains, and the redispatch operation amounted to six or seven trains, and there would have been saved two or [fol. 3364] three trains; and you get at the difference by subtraction instead of by actual determination." And there the quotation ends. Now, do you mean that you don't make an actual determination in the freight redispatching study, or simply that you don't make an actual determination of any specific or individual train to be eliminated?

A. The latter is my contention, that we don't determine the specific individual train eliminated.

The Court: Well, the Court so understood it.

Mr. Mason: Whereas, in the passenger redispatching studies, you eliminated an actual and specific train?

A. Yes.

Q. Now, refer to your exhibit 234 again. I think that you said, prior to the noon recess, that it was possible by reference to the exhibit to determine what the additional operation would have been if the law had been observed even though the precise figures of additional train operation in the sense of train-miles may not appear on the exhibit?

A. Yes.

Q. Can you point to the showing on the exhibit which you had in mind?

A. The total for the territory, Yuma to Gila indicates [fol. 3365] 377 trains actually operated and on the redispatch 399 trains, an increase of 22 trains in that particular district. The grand total, trains between Yuma and El Paso, indicates 1,550 trains actually operated as compared with 1,614 trains which would have been operated according to our redispatching study, an increase of 114 trains.

Q. Now, I notice that between Yuma and Gila there were actually operated eastward 175 trains, and westward 202. Does that indicate an unbalance of trains?

A. Yes, there were 27 more trains operated westbound than eastbound, which would have required the double-heading of locomotives and deadheading of train crews in the opposite direction to balance the power and crews.

Q. That was in actual service, was it?

A. Yes.

Q. Now, was that an actual requirement rather than a potential requirement?

A. That was an actual requirement.

Q. Now, what do we find on the redispatching study as to the unbalance?

A. On the redispatching study under the 70-car restriction, we go further out of balance, we find that there were [fol. 3366] 47 more trains westward than eastward.

Q. Does a similar condition appear in some of the other districts?

A. Yes, Gila to Tucson, actually there were 24 more trains westward than eastward, and on the redispatch there were 44 more trains westward than eastward. Similar differences prevail between Tucson and Lordsburg, but between Lordsburg and El Paso there was no change indicated as a result of the redispatching study.

Q. There was substantially the same operation, generally speaking, between Lordsburg and El Paso in the redispatch as in the actual, was there?

A. That is right.

Q. The figures, of course, here would indicate precisely what the differences were?

A. Yes, sir.

The Court: Then, Mr. Sines, in your recapitulation of your redispatch in the territory from Yuma to El Paso, the 107 trains of over seventy cars, all of those operated between Lordsburg and El Paso paying due respect to the Arizona law in the redispatched operation?

A. That is right. That can be quickly checked.

The Court: I see that can.

[fol. 3367] Mr. Mason: Have you any other comments on exhibit No. 234?

A. No, I don't think so.

Q. Have you before you a chart in one sheet entitled, "Relative Train Lengths, Arizona, California, New Mexico, Texas, Through and Local Freight Trains Operating Via Yuma, Gila, Tucson, Lordsburg, and El Paso, Based on Redispatching Study of April, 1940, Observing 70-Car Restriction and Using Present Power and Short Sidings"?

A. Yes.

Mr. Mason: May this be marked "Defendant's Exhibit No. 235" for identification?

The Court: It may be marked.

The Clerk: Defendant's exhibit No. 235 for identification.

Mr. Mason:

Q. Is this likewise based on the redispatching study, item No. 5 of your exhibit No. 196?

A. It is.

Q. And prepared under your direction?

A. Yes.

Q. What is the source of the figures shown on the exhibit?

A. Data abstracted from the actual and redispatched train sheets.

[fol. 3368] Q. As to the territory west of Yuma, is that one especially prepared in the office of the auditor of equipment service accounts?

A. Yes, for the 27 day period, April 4th to April 30th, 1940.

Q. Did you consolidate the trains entering Yuma from the west so as to include those coming from the Imperial Valley direct as well as those coming from Indio via Niland?

A. That is correct. There are shown hereon trains entering Yuma from the west and trains departing Yuma to the west.

Q. Is this exhibit a counterpart of exhibit No. 215?

A. Yes.

Q. This exhibit is a showing similar in its general aspects to exhibit No. 215, is it?

A. Yes.

Q. Has it been checked against the underlying sources?

A. It has.

Q. Will you state whether it is true and correct?

A. It is true and correct.

Mr. Mason: Have you any questions, Mr. Strouss?

[fol. 3369] Mr. Strouss: No questions.

Mr. Mason: Has the Court any questions?

The Court: No.

Mr. Mason: We offer the exhibit as defendant's exhibit No. 235.

Mr. Strouss: Same objections.

The Court: Objections overruled, it may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 235.").

Mr. Mason:

Q. Mr. Sines, I notice from exhibit No. 235 that the cross-hatching appears only or practically only in connection with

the westward operation. There is apparently very little difference between the average actual trains and the average redispatched shorter trains for the eastward operation. Will you explain why that is?

A. Because the preponderance of traffic during April, 1940, was westward and we brought the westward train operation more nearly into balance with the eastward operation by lengthening our westward trains. We did run a few long trains eastward but not to the same extent that we did in the opposite direction.

Q. Was it necessary in the 1940 long train operation to [fol. 3370] observe siding clearance, generally speaking, one way or the other?

A. Yes, that was a further handicap that had its reflection in the results of that long train operation in April, 1940. We still had to observe siding clearance generally with the trains in one direction and on top of that we couldn't add appreciably to the length of our eastward trains with the power that we had available at that time.

Q. By referring to the preceding exhibit, I notice that between Yuma and Gila there were 77 westward trains having 71 or more cars but only 12 eastward trains. Is that condition reflected on the Yuma-Gila district as it appears on exhibit No. 235?

A. Yes.

Q. Do I understand you to say that is because of an unbalance of traffic as measured in car-miles westward?

A. Yes.

Q. As against the eastward traffic?

A. Yes.

The Court: Mr. Sines, referring back for the moment to exhibit No. 234, I notice in the upper block the operations from Yuma to El Paso over your northern route there was an actual saving in your long train operation as against [fol. 3371] your redispatched when you complied with the Arizona law of some 64 trains, whereas in the lower block, your southern route, apparently you ran exactly the same number of trains in your actual operations where you paid no attention to the restrictions of the Arizona law as you did in your redispatch?

A. That is right.

Q. Will you explain that? How you would affect the saving in one instance and not in the other, I mean a saving in the number of trains?

A. Yes. The situation on the South Line via Douglas was the same in 1940 as it was in 1938, we were running one train a day in each direction and——

Mr. Mason (Interrupting): You mean one through train in each direction, I take it?

A. It has a connection at Douglas, but it is not a through train. They do local work down there.

Mr. Mason:

Q. What I had in mind was exclusive of the Douglas-Bisbee service?

A. Yes. We couldn't cut any trains out on the South Line by consolidation or elimination. We always have to run the one train.

The Court:

Q. If you only had one train a day each way, that would be two trains operated daily and you have two districts so [fol. 3372] you would have double that, that would be four, and four times the twenty-six days that you operated would be 104, whereas you actually operated 176 trains so that there was more than one a day each way during that 27-day period on the average?

A. All right, let's look at Douglas-El Paso. We have 29 trains east and 28 trains west as compared with the 27-day period.

The Court: I possibly overlooked the Douglas-Bisbee Junction operation where you actually had 48 trains there; that was included in the total of 176?

A. That is right.

The Court: That may account for it.

A. That helps to account for it, but between Douglas and El Paso they apparently ran one train in one direction and two trains in the other direction over the one train per day and we exceeded that a little bit between Tucson and Douglas. Just what the occasion for that was I don't know, but the big difference was that it should have included the Douglas-Bisbee Junction turnaround and which are put in here because during the long train operating period we ran

nine of those Douglas-Bisbee Junction trains over 70 cars in length as is indicated in columns C and E. They fit into [fol. 3373] a through train operation occasionally, too, and this is the use we made of them in our 1938 redispatch. They handle empty ore cars from Cakmet, a station near Douglas, west to Bisbee Junction, and they have a little excess capacity on the locomotive; and on the redispatching operation in 1938 we had them handle some empty cars west from Douglas to Bisbee Junction where those empty cars would be set out and picked up by this one train a day west operating between Douglas and Tucson. The maximum grade west from Douglas occurs between Douglas and Bisbee Junction, and the Douglas-Bisbee Junction turnaround train thus assisted one local train west in handling the tonnage over the most difficult part of the trip.

Mr. Mason:

Q. Going to exhibit No. 235, Mr. Sines, does the fact that the saving was substantially all on the westward movement as indicated here reflect the opportunity or lack of opportunity for long train operation imposed by the siding lengths?

A. Yes, there are two factors governing the length of the eastward trains, one of them was siding length and one of them was capacity of present power.

Q. In this case the eastward trains in a practical sense, [fol. 3374] because of the long westward trains, could not exceed siding length in the same territory, is that correct?

A. Yes.

Q. With the present siding lengths even if the Train Limit law were disregarded, would it in a practical sense be a one-way operation in one way or the other so far as exceeding the 70-car limitation was concerned?

A. You might say that was the general situation although yesterday or the day before I did mention cases where by timing the departure of trains from terminals it is possible to exceed the siding length with trains in each direction, but that is not a regular and general operation.

Q. Would a condition of this kind, as indicated by exhibit No. 235, obtain in greater or less degree throughout the year if the law were disregarded?

A. It would obtain to this extent the year round first in one direction and then in the other direction depending upon the surges and the movement of traffic.

Q. Wherever the unbalance happened to be?
A. Yes.

The Court:

Q. Mr. Sines, to put this another way, your entire re-
[fol. 3375] dispatch study on all of the exhibits that have been admitted in evidence disclosing the effects of it is based upon a Utopian condition, that is, if all of the sidings were extended and if we had big power here is what we could do. You are not able, when you were turned loose for 27 days, to make anywhere near as good a showing on your actual operation without restriction of the law as you were able to show on your redispatching study which, as I put it, was somewhat of a Utopian situation?

A. That is true. You will remember that one of my very first exhibits was a siding extension program and then we followed that shortly with my assignment of power.

The Court: When I say "Utopian," I don't mean to infer that that condition could not—that is, a favorable condition could not be realized with the necessary outlay of money to improve the rights of way and so forth.

Mr. Mason:

Q. Mr. Sines, would there be any practical benefit of extending the sidings if the law is to be observed?
A. No.

The Court:

Q. In other words, you get along very nicely as it is?
[fol. 3376] A. Yes, sir.

Q. And have been getting along with the sidings of the present length these many years?

A. Always with the shackles of the law around us, we manage to get along, yes. Our present plant is adequate to handle the business the way we have to handle it.

Mr. Booth: The law gave us all we were doing then but froze us at that point.

The Court: I think I see the situation.

Mr. Mason:

Q. Again, Mr. Sines, you have shown what the cost would be both from the capital standpoint and on the annual basis

as opposed to the gross saving which would be achieved if the law were disregarded with the implements at hand to disregard it, have you?

A. Up until now I have only given you an indication of what the savings would be as regards train-miles. I haven't got to the money stage yet, but I hope to soon.

Q. Except as to the wages?

A. Yes.

Q. Let's return to exhibit No. 235. This shows what the saving could be with the present far from ideal conditions?

A. That is right.

[fol. 3377] Q. And is in a sense an example of the saving which was achieved, is it not?

A. Exactly.

Mr. Strouss: I think I am going to have to object to that as leading.

The Court: Yes, the last question was leading; objection sustained.

A. There is one other comparison I would like to make between exhibit No. 234 and exhibit No. 235, if I may. Looking at the figures in the total, columns H and P, for the Yuma-Gila territory, it is apparent that eastward the redispatching operations show we would have had to run only one more train if we had observed the law eastward and we would have had to run 21 more trains westward if we had observed the law. That, in large measure, is the reason for the close proximity of the lines on exhibit No. 235 in the eastward operation. There is only a difference of one train in the Yuma-Gila district eastbound, one train in the Gila-Tucson district eastbound, one train from Tucson to Lordsburg eastward. The greatest difference, or practically the entire difference, occurs in westward operations, which is shown by the separation of the lines on exhibit No. 235 on the westward block.

[fol. 3378] The Court: You have already testified that the April traffic covered by the period that you were operating without the restriction of the Arizona law, that the bulk of that was westward?

A. Yes, sir, I would rather say the preponderance was westward.

[fol. 3379] Mr. Mason: Mr. Sines, looking at exhibit No. 235, will you say whether or not this represents graphically a saving which might reasonably be achieved forthwith if the restrictions of the law were lifted or discarded?

A. Yes.

Q. Would any additional capital outlay be involved in achieving this particular saving?

A. None at all. There is another twist that you don't see there unless your attention is called to it particularly. Between Lordsburg and El Paso redispatched trains were longer than the actual trains westward because in actual operation, we did take a few cars off the north line and sent them down through Douglas, a very few. On the redispatched operation they returned on their normal route on the north line.

The Court: And this exhibit 235 doesn't cover the operations on the south line at all?

A. No.

Q. Whereas, Exhibit 234 shows both?

A. Yes, sir.

Mr. Mason: Is there anything further on Exhibit 235, Mr. Sines?

A. No.

Q. Have you before you a statement in two sheets en- [fol. 3380] titled "Redispatch Study—Operating Statistics, Yuma, Arizona, to El Paso, Texas, for period April 4th to April 30th, 1940, Actual Operation Compared with Redispatched Operation, Observing Seventy Car Restriction and Using Present Power and Short Sidings."

A. I have.

Mr. Mason: May we have this statement marked "Exhibit 236," your Honor?

The Court: It may be marked.

The Clerk: Defendant's Exhibit No. 236 for identification.

Mr. Mason: Was this exhibit prepared by you or under your supervision, Mr. Sines?

A. It was prepared under my direction and supervision.

Q. From what sources?

A. From the totals on the white work sheets A; and back of the white work sheets A, of course, are the actual and redispatch train sheets.

Q. You call a portion of this exhibit, a block of the exhibit refers to the north line. Is that the line via Gila and Lordsburg?

A. Once again that means the line by Gila and Lordsburg.

Q. You show separately the statistics for that line and the [fol. 3381] south line, do you?

A. Yes.

Q. How did you arrive at the—perhaps I should ask you first, does this exhibit correspond to No. 226?

A. Yes.

Q. Was it prepared along the same lines?

A. It was.

Q. I take it that all of the notations which are shown by numbers in parentheses are explained in full on the second sheet?

A. That is right.

Q. Are there any differences between this exhibit and Exhibit 226, as to method of compilation which require explanation?

A. No.

Q. Now, you show in each block, the separate blocks being identified by Roman numerals, the notation "Increase for Period." Does that mean the increase in the number of the various items shown in columns A to F, inclusive, for the period April 4th to April 30th, inclusive, 1940?

A. Yes, as indicated in the title.

Q. Has the exhibit been checked?

A. It has.

Q. And the totals, are those correctly computed?

[fol. 3382] A. Yes.

Q. What is the purpose of the exhibit?

A. To show the results of the redispatch study in these operating statistics, and also to develop figures upon which to base estimates of costs.

Q. Now, Mr. Sines, I think that in your oral testimony with reference to exhibit 234, you stated that there were 114 more trains operating in redispatched operations than were actually operated. If I read your exhibit correctly, the difference is the difference between 1,550 and 1,614, the figures appearing on exhibit 234, and that difference would be 64?

A. That is right, my 114 was in error.

Q. Does that same computation appear in actual figures in the total for the north line for the number of trains in the first column of exhibit 236 for identification?

A. It does.

Q. Is there any additional explanation you desire to make with reference to the notes on the second sheet?

A. No, only to call attention to them and to the fact that they are explanations of the numbers appearing on the face of the first sheet.

Q. Are they largely or entirely for the purpose of ac- [fol. 3383] counting for the difference between the number of cars actually moved and the number of cars moved on the redispatch study?

A. That is right.

Mr. Mason: Have you any questions, Mr. Strouss?

Mr. Strouss: No questions.

Mr. Mason: Has the Court any questions?

The Court: No.

Mr. Mason: We offer the exhibit in evidence as Exhibit No. 236.

Mr. Strouss: The same objection as to the previous exhibit.

The Court: The objection is overruled. It may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 236.")

Mr. Strouss: Do you have the 521 and 1232's for 1940?

A. Yes.

Mr. Strouss: I would like to have copies of those.

The Witness: All right.

Mr. Mason: Forms 521 and 1232 for 1940?

Mr. Strouss: Yes.

Mr. Mason: Is that all complete now?

The Witness: Yes, that is available.

[fol. 3384] Q. Mr. Sines, did you as a result of and in connection with the redispatching study of April, 1940, prepare an exhibit reflecting the arrival times at El Paso, Texas, of fruit blocks and manifest sections moving during that period?

A. Yes, sir.

Q. Similar in form to your exhibit 227?

A. Yes.

Q. Will you state its title, please?

A. "Arrival time at El Paso, Texas, of Fruit Blocks and Manifest Sections, Actual Operation Compared with Redispatch Operation, Observing Seventy Car Restriction and Using Present Power and Short Sidings, April 4th to May First, Inclusive, 1940."

Q. From what sources was this exhibit prepared?

A. From the actual and the redispatch train sheets.

Mr. Mason: May this be marked Exhibit 237, your Honor?

The Court: It may be marked.

The Clerk: Defendant's Exhibit No. 237 for identification.

Mr. Mason: Has it been compared with the actual and redispatch train sheets?

A. It has.

[fol. 3385] Q. And I take it that the computations which are shown in the second, third, fourth and fifth sheets in columns G and H are your own computations?

A. That is right.

Q. Is it substantially identical in form to Exhibit 227?

A. Yes.

The Court: Mr. Sines, you haven't added an extra day on us here? All your previous exhibits referred to the period April 4th to April 30th, and this goes from April 4th to May first.

A. Well, I would explain that by saying that one of the trains that left Lordsburg on April 30th arrived at El Paso 5 A. M. May first.

The Court: Was that the reason for including the May first date?

A. Yes, that is shown on sheet 5.

Q. And that was the only reason?

A. Yes.

Mr. Mason: I should have said, Do the explanations made in connection with Exhibit 227 likewise apply with reference to Exhibit 237?

A. They do.

Q. Is the exhibit true and correct to the best of your knowledge and belief?

A. It is.

[fol. 3386] Mr. Mason: Have you any questions, Mr. Strouss?

Mr. Strouss: You didn't have any difference in this one with respect to arriving at the yard and arriving at the ice house?

A. No, in April 1940, the ice house was not operated.

The Court: This covers the north line and has nothing to do with the south line?

A. That is right. I might say that none of our perishable trains operate over the south line in normal operation; they all go through Lordsburg.

Q. Is that because you can make quicker time that way?

A. Yes, and because the north line is a cheaper route to operate than the south line.

Q. What is the difference in the operating time between Tucson and El Paso, say, over your north line and over your south line?

A. That is largely a matter of train interference and distance. It is 30 miles longer through Douglas than it is over the north line, and it depends on the number of trains which you have to meet. My answer a moment ago when I said yes, it is a quicker route, was not an exactly correct answer, there are so many other factors involved in that besides just dispatching speed.

[fol. 3387] Mr. Mason: It is thirty miles shorter, that contributes some difference in the cost and time?

A. That is right.

Q. Then with the refrigerator cars there is two cents per car-mile each way?

A. That is right.

Q. You might explain to the Judge what it costs the company.

A. We pay the Pacific Fruit Express Company, and any other railroad in the United States pays the Pacific Fruit Express Company two cents a mile for the use of that car whether the car be loaded or empty.

The Court: And if the car were not moved you wouldn't have to pay anything for that day?

A. No, sir.

Q. Whereas, with these other connecting carriers where their cars are on your line you pay a dollar a day?

A. That is right.

Mr. Mason: Now, the difference is that refrigerator equipment is paid for on the mile basis and ordinary boxcar equipment is paid for on the day basis?

A. That is right.

Q. Now, the difference between moving seventy refrig- [fol. 3388] erator cars to El Paso by Lordsburg and moving seventy refrigerator cars to El Paso by Douglas is sixty cents a car, is it not?

A. That is right.

Q. Or $42 for a seventy-car train?

A. That is right.

Q. Is that one reason for moving trains over the shorter route?

A. That is one of the reasons.

Q. And the expense of hauling a train thirty miles further?

A. Yes.

Q. Independent of the car rental feature?

A. Yes.

Mr. Mason: I offer Exhibit 237 in evidence.

Mr. Strouss: The same objection as to the previous exhibit.

The Court: The objection is overruled. It may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 237.")

Mr. Mason: Will you take up an exhibit in three sheets entitled "Arrival Time at Yuma, Arizona, of 'SSW' and 'GBW' Westward Manifest Trains, Actual Operation Compared with Redispatched Operation, Observing Seventy Car [fol. 3389] Restriction and Using Present Power and Short Sidings."

A. Yes.

Mr. Mason: May that exhibit be marked Exhibit 238, your Honor?

The Court: It may be marked.

The Clerk: Defendant's Exhibit No. 238 for identification.

Mr. Mason: Does this exhibit correspond to your exhibit 228, Mr. Sines?

A. It does.

Q. What is the source of the information shown on the exhibit?

A. The actual and redispatch train sheets.

Q. Is the information shown here abstracted directly from the actual and redispatch train sheets?

A. It is.

Q. The computations in columns F and G are computations appearing from the figures in the preceding columns, are they?

A. Yes.

Q. Has the exhibit been checked to determine whether it is true and correct?

A. It has.

Q. Will you say whether or not it is true and correct?

[fol. 3390] A. It is.

Q. I take it that its purpose is the same as the preceding exhibits of the same form?

A. Yes.

Mr. Mason: Have you any questions, Mr. Strouss?

Mr. Strouss: No questions.

Mr. Mason: Has your Honor any questions?

The Court: No.

Mr. Mason: We offer the exhibit as Exhibit No. 238.

Mr. Strouss: The same objection.

The Court: The objection is overruled. It may be admitted in evidence.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 238.")

Mr. Mason: Have you an exhibit in one sheet entitled "Redispatch Study Wage Data Yuma, Arizona, to El Paso, Texas, for Period April 4th to April 30th, 1940?"

A. I have.

Q. And this exhibit again compares the redispatched with actual operation, observing the seventy-car restriction and using present power and short sidings?

A. That is right.

Mr. Mason: May this exhibit be marked Exhibit No. 239, [fol. 3391] if your Honor please?

The Court: It may be marked.

The Clerk: Defendant's Exhibit No. 239 for identification.

Mr. Mason: From what source was it prepared, Mr. Sines?

A. From the white work sheets A.

Q. What other exhibit, if any, preceding does this exhibit resemble?

A. This exhibit resembles Exhibit 229.

Q. Was it prepared in the same way?

A. It was.

Q. This, I take it, is the converse or opposite, so to speak, of 229 in that this shows an increased expense by reason of the redispatched operation rather than a reduction?

A. That is right.

The Court: Mr. Sines, referring back to exhibits 237 and 238 for a moment, I am not certain that I get the import of the data contained under 5A on the front page of each exhibit. Now, do I understand that with your redispatch trains, that they actually make better time and arrive in advance of those that I will term long trains to the extent shown there in that exhibit?

A. Yes.

[fol. 3392] Q. In other words, the longer train slowed up operations?

A. Yes, because of the handicap of short sidings.

Mr. Strouss: Now, that last, I move it be stricken.

The Court: Yes, it was volunteered and it may be stricken.

Mr. Mason: Now, Mr. Sines, in actual operation eastward, as represented on No. 237, were there any substantial number of long trains operated?

A. In eastward operations, there were twelve long trains operated between Yuma and Gila, sixteen between Gila and Tucson, seven between Tucson and Lordsburg.

Q. And that is out of a total of something like 1,172 trains, isn't it?

A. That is right.

Q. So there was no substantial long-train operation eastward which might have resulted in long trains arriving to any extent later than short trains would have arrived?

Mr. Strouss: I object to that as leading.

Mr. Mason: I will withdraw the question.

Q. I think you had explained that Exhibit 239 was prepared along the same lines and in the same manner as [fol. 3393] Exhibit No. 229?

A. That is right.

Q. Have you checked the exhibit against the underlying sources, Mr. Sines?

A. I have.

Q. Now, as to the variable items in columns B and H, I think you have explained how that item was calculated in connection with Exhibit 229. I will ask you if you followed the same methods here.

A. That is right. The variable item in this instance is increased in the same proportion as the increase in train miles for trainmen and locomotive-miles for enginemen.

Q. And in computing the railroad retirement and unemployment insurance tax, does that represent moneys paid by the company as and for that particular type of tax based upon the wages?

A. Yes; sir.

Q. Is it computed only against the difference between the actual and the redispatched wage items?

A. That is all.

Q. Where do you obtain this 5.94 per cent?

A. In 1938, the company's proportion of those two taxes totaled five and three-quarters per cent, but in 1940 it had advanced to 6.0 per cent.

Q. But you show here 5.94. Is that because of the elimi- [fol. 3394] nation of a portion of the wage payments from the incidence of the tax?

A. Yes, those salaries totaling more than $300 a month.

Q. Then, this is the actual money tax paid for trainmen's wages applied against the total amount paid them as wages and a ratio thus derived rather than taking the flat six per cent?

A. That is right.

Mr. Mason: Have you any questions on the exhibit, Mr. Strouss?

Mr. Strouss: No.

Mr. Mason: Has your Honor any questions before the exhibit is offered?

The Court: No.

Mr. Mason: We offer the exhibit as defendant's Exhibit 239.

Mr. Strouss: The same objection as to the previous exhibit.

The Court: The objection is overruled. It may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 239.")

Mr. Mason: Mr. Sines, have you made any attempt to expand the figure of the wage decrease, or, rather, increase, as indicated so as to arrive at an annual figure for 1940.

[fol. 3395] A. No, I have not.

Q. This $3,832.32 simply represents, according to the exhibits whatever wage savings plus tax there may have been in 27 days?

A. That is right.

The Court: Mr. Sines, referring now to Exhibit 229 as well as to Exhibit 239, I notice, first on the exhibit 229 that in your redispatching study, the cost of the items shown on this exhibit actually increased on the south line to the tune of $558.93?

A. Yes.

Q. And on your corresponding exhibit 239, you were able to show a decrease for the period over the south line of $8.84?

A. That is right.

Q. Now, forgetting the south line for a moment, your real economy or saving for the period June and August, 1938, as shown by exhibit 229, was $48,000 plus for the two months. Dividing that by two would give you approximately $24000 a month average saving?

A. That is right.

Q. That was under the ideal conditions heretofore testi-

[fol. 3396] fied to with long sidings and the heavy power?

A. That is right.

Q. As opposed to that, under your redispatching study of the period April 5th to 30th, shown by Exhibit 239, you were only actually able to make a saving where you operated without the restriction of the Arizona law of the sum of $5,000 plus, or less than a fourth of the estimated savings under your ideal conditions?

A. That is right.

Mr. Mason: Mr. Sines, the items mentioned in the Court's question relate only to wage savings on the north line?

A. Yes.

The Court: And it only covered, I appreciate a 27-day period as against a full month on the other.

Mr. Mason: What is the basic reason why the saving in April as indicated by Exhibit 239, omitting the small item of tax, would be $5,518 as indicated by the exhibit, whereas it would be, as suggested by the Court, approximately $24,000 per month, as shown by Exhibit 229?

A. The whole answer is found in column B of each exhibit. Under ideal conditions we can save $114,240 train [fol. 3397] miles in two months, or 57,000 in one month, according to Exhibit 229, but on exhibit 239 we were able to save 8,733 train-miles, and when we say "ideal conditions" we have in mind the extended sidings and larger power.

Q. Are these ideal conditions in any sense impracticable or out of reason?

A. No, they are found on every other part of our main line on this railroad, with the exception of the territory in Arizona.

Q. Now, you say that the difference is found in the difference in train-mile saving. What is it that prevented a train-mile saving, if one was prevented, in April of 1940, but which permitted a more substantial train-mile saving, if one was permitted, by the redispatching study of 1938; what physical condition is it, or other condition?

A. The length of sidings and power.

Q. And what is it that prevents those sidings from being extended today? Is there anything to prevent them from being extended?

A. No, we can extend them as shown by my siding extension program if there is any reason to extend them.

The Court: We will take our afternoon recess.

(Thereupon, a short recess was taken, after which the witness was recalled to the stand, and proceedings were resumed as follows:)

[fol. 3398] Mr. Mason: I don't believe exhibit No. 239 has been offered.

The Court: It was admitted.

Mr. Mason:

Q. Mr. Sines, have you reviewed the forms 521 for 1940 to determine the percentage relationship between the traffic

handled in April of that year as measured in gross ton-miles on the Tucson division and the traffic handled in the entire year?

A. I have.

Q. What percentage of the total traffic of the Tucson division measured in gross ton-miles was handled during the month of April, 1940?

A. During the entire month of April there was handled 8.65 per cent of the total year's business.

Q. What would one-twelfth of the year be?

A. 8.33 per cent. During the twenty-seven days of April, figuring that on the basis of twenty-seven thirtieths of the 8.65, there was handled 7.78 per cent.

Q. Mr. Sines, will you turn to an exhibit in one sheet bearing title, "Main Line Freight Trains of Various Lengths Operated between Yuma, Arizona, and El Paso, Texas, Via Gila, Arizona, and Lordsburg, New Mexico, and Via Douglas, Arizona, over South Line during Period [fol. 3399] April 4th to April 30th, 1940, Inclusive, Actual Operation Compared with Redispatched Operation with no Restriction and Using AC Power and Long Sidings"?

A. Yes.

Q. Have you that exhibit before you?

A. I have.

Q. What is the basis of this exhibit?

A. The basis of this exhibit is a redispatched study to determine what the results would have been during the 27-day period of April had we been able to operate with long sidings and with larger power.

Q. The series of exhibits just concluded ending with exhibit No. 239 had to do with making long trains into short ones, had it?

A. Yes, sir.

Q. And the first redispatching study of 1938 had to do with making Arizona-size trains, 70 cars or less, into long trains with AC power and long sidings?

A. Yes.

Q. What is this redispatching study?

A. This takes the long trains of the 27-day period, April 4th to 30th, and makes longer trains out of them assuming that we have longer sidings and larger power.

[fol. 3400] Q. Do you contemplate for the purposes of this study the same siding extensions and same types of

locomotives as were contemplated for the 1938 redispatching study?

A. Yes, sir.

Q. What underlying documents did you employ in preparing the exhibit before you?

A. This exhibit was prepared from the actual and redispatched train sheets.

Mr. Mason: May we have this statement marked as "Defendant's Exhibit No. 240" for identification?

The Court: It may be marked.

The Clerk: Defendant's exhibit No. 240 for identification.

Mr. Mason:

Q. Does it resemble any of the preceding exhibits, Mr. Sines?

A. Yes, we have two exhibits like this, one of them is No. 234 and the other is No. 214.

Q. I take it this is simply a train count from the actual and redispatch train sheets?

A. That is right.

Q. Does the actual showing on this exhibit reproduce the showing of actual — which is on exhibit No. 234?

A. It does.

[fol. 3401] Q. Has the exhibit been checked against the underlying sources?

A. It has.

Q. Will you say whether or not the exhibit is correct insofar as it reflects those underlying sources?

A. It is correct.

Q. Now as to the computations, have they been checked?

A. They have.

Q. Will you say whether or not they are correct?

A. They are.

Q. I take it this exhibit has a purpose similar to that previously stated by you for exhibit Nos. 214 and 234?

A. Yes, sir.

Mr. Mason: Have you any questions on exhibit No. 240, Mr. Strouss?

Mr. Strouss: No questions at present.

Mr. Mason: Has the Court?

The Court: No.

Mr. Mason: We offer the exhibit in evidence as defendant's exhibit No. 240.

Mr. Strouss: The same objections as to the previous exhibits.

[fol. 3402] The Court: Objections overruled, it may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 240.")

Mr. Mason:

Q. If I read the exhibit correctly, there was practically no change made in the South Line operations as between the actual and redispatch operations during the period covered by exhibit No. 240?

A. That is right.

Q. The only change, or at least the only change of any account, is in the making of the trains actually operated into still longer trains on the basis of AC power and longer sidings?

A. Yes.

The Court: Then the real gist of this is expressed in the recapitulation there that under your actual long train operations during this period you had 25 plus per cent of trains with over 70 cars, whereas under your ideal conditions you stepped that up to 76 per cent?

A. That is right.

Mr. Mason:

Q. Mr. Sines, have you any other comments on exhibit No. 240?

A. No, but right along the line of the judge's last question I would like to call attention to exhibit No. 214, re- [fol. 3403] capitulation of the redispatch, indicating that in June and August, 1938, we showed 80 per cent of trains over 70 cars.

The Court: How do you reconcile the difference in percentage there?

A. I was wondering how I was going to volunteer the thought that that is a pretty good comparison.

Mr. Mason:

Q. Will you turn to a chart in one sheet entitled, "Relative Train Lengths, California, Arizona, New Mexico,

Texas, Through and Local Freight trains operating via Yuma, Gila, Tucson, Lordsburg, and El Paso, Excluding Strauss Turn-around Trains, Based on Redispatching Study of April, 1940, with No 70-Car Restriction and Using All Power and Long Sidings"?

A. Yes.

Mr. Mason: May we have this marked "Defendant's Exhibit No. 241" for identification?

The Court: It may be marked.

The Clerk: Defendant's exhibit No. 241 for identification.

Mr. Mason:

Q. By the way, Mr. Sines, exhibit No. 240 and exhibit No. 241 for identification are related to the redispatching study which is identified as item No. 6 on your exhibit No. [fol. 3404] 196, are they not?

A. Yes.

Q. Does this exhibit resemble exhibits Nos. 215 and 235?

A. Yes.

Q. Prepared in the same manner?

A. Exactly.

Q. From the same sources or similar sources to these exhibits?

A. Yes.

Q. Has the exhibit been compared against these underlying sources to determine its correctness?

A. It has.

Q. In order that the record may be complete, will you state what is the principal underlying source for the information shown for the territory east of Yuma?

A. Statistics from the actual and redispatched train sheets.

Q. Is the exhibit true and correct?

A. It is.

Mr. Mason: Have you any questions, Mr. Strouss?

Mr. Strouss: No questions.

Mr. Mason: Has the Court?

The Court: No.

[fol. 3405] Mr. Mason: We offer the exhibit as defendant's exhibit No. 241.

Mr. Strouss: The same objections as to the previous exhibits.

The Court: Overrule the objections, it may be admitted.

(The document referred t was received in evidence and marked "Defendant's Exhibit No. 241.")

Mr. Mason:

Q. Mr. Sines, I will ask you first to take your exhibit No. 241 and your exhibit No. 215. Exhibit No. 215 shows that in the redispatch operation you were able to obtain during June and August, 1938, train lengths east of Yuma running between 85.2 cars per train and 89.1 cars per train, whereas the showing on exhibit No. 241 ranges from 76.7 cars per train up to 83.2?

A. That is right.

Q. How do you explain that difference?

A. In April we were in a different perishable season than we were in June, 1938, or in June of any year. In June, 1938, we were receiving very long trains from the Imperial Valley. We didn't have those trains in April and the result was that the trains redispatched east from Yuma did not attain quite as great a length as they did during June, 1938.

[fol. 3406] Q. Is that difference illustrated by the figure of actual average train length in the district of eastward trains in the territory west of Yuma?

A. That is right.

Q. There is also some difference between the westward average train lengths in the territory east of Yuma. You show on exhibit No. 215 an average train length very close to 93 cars throughout the territory from El Paso to Yuma; whereas in the 1940 redispatch the train length varies down from 92.8 to 84.6?

A. That is right.

The Court: In that connection, Mr. Sines, I notice from exhibit No. 241 that your train lengths under this redispatching study of April, 1940, you get progressively longer trains the further east you get clear into El Paso, and as compared to your California actual operations during that same period which were under no law restriction you only had 81.5 as against 92.8 over in your Rio Grande division. In other words, you are getting progressively longer trains as you go eastward.

Mr. Mason: I think your Honor is referring to a westward movement.

The Court: I guess I am incorrect there.

[fol. 3407] Mr. Mason: While your Honor's question does refer to the westward movement, I would like to ask the witness if there is any particular explanation to be made there?

A. The same tendency is evident in exhibit No. 215 and I don't find any ready explanation for that except it is the result of the entire railroad operation where trains east must balance or should nearly balance with the trains west.

Mr. Mason:

Q. You mean as to number or length?

A. As to number.

The Court: Could that be explained by the fact that some of those cars are dropped off into Arizona local traffic?

A. No.

Q. Shipments consigned to Arizona?

A. I wouldn't think Arizona local traffic would affect this very much in April. There is a considerable difference in the length of trains westbound from Yuma comparing June and August, 1938, against April of 1940. That, again, is due to the fact that in June, 1938, we were running long trains into the Imperial Valley as well as out of the Valley, whereas in April, 1940, we were not running those particular trains and a large part of the operation west of Yuma [fol. 3408] was confined to the line Yuma to Indio.

Mr. Mason:

Q. Mr. Sines, will you take exhibit No. 241 and also exhibit No. 235. Have you exhibit No. 235 before you?

A. Yes.

Q. I will ask you whether it is possible with those two exhibits to determine or to visualize, let us say, the differences between redispatched operation using AC power and long sidings in April, 1940, and operations in complete compliance with the Arizona law?

A. Yes.

Q. How is that done?

A. It would be possible to superimpose exhibit No. 235 over exhibit No. 241 so that the line 68.7 between Yuma

and Gila would lie directly on the line 68.7 between Yuma and Gila and you would then find that the redispatch short operation of 62.7 cars would compare with the redispatch long train operation of 84.6 cars and the hatched portion of the chart would extend down to the 62.7 line.

Q. Would it be possible simply to draw in the lines representing the redispatched short train operation on exhibit No. 235 in their proper places on exhibit No. 241 in order to obtain the complete picture?

[fol. 3409] A. That is right.

Q. In other words, the two charts can be combined so as to give the full difference such as is indicated by exhibit No. 215?

A. That is right.

Q. Will you turn, please, to a statement in two sheets entitled, "Redispatch Study, Operating Statistics, Yuma, Arizona, to El Paso, Texas, for Period April 4th to April 30th, 1940, Actual Operation Compared with Redispatched Operation, with No Restriction and Using AC Power and Long Sidings"?

A. Yes.

Mr. Mason: May this exhibit be marked No. 242 for identification?

The Court: It may be marked.

The Clerk: Defendant's exhibit No. 242 for identification.

Mr. Mason:

Q. Did you prepare or supervise the preparation of exhibit No. 242?

A. I did.

Q. From what sources was it prepared?

A. From the white work sheets A which were compiled from the actual and redispatched train sheets.

[fol. 3410] Q. You show here a segregation by freight train districts, does that correspond to segregations on previous exhibits similar in form to this?

A. That is right.

Q. Will you identify those previous exhibits?

A. Exhibit No. 226 is the corresponding exhibit for the June and August, 1938, redispatch, and exhibit No. 236 is the corresponding exhibit for the April 4th to 30th redispatch using present power and short sidings.

Q. Was this prepared in exactly the same way as exhibit No. 226 and No. 236?

A. Yes, sir.

Q. You show an average number of cars per train in column F for each of the districts. Are those the average lengths counting the trains in both directions?

A. Yes.

Q. Whereas the average train lengths shown on exhibit No. 241, for example, are computed separately as to eastward and westward trains?

A. That is right.

Q. One other item, in column F you show cars per train, whereas in other columns there appears to be a difference styled, "Decrease for period," and in column F that desig-
[fol. 3411] nation doesn't appear to apply. Will you explain that?

A. Apparently there was an oversight in the preparation of this exhibit. The "I" indicating increase at the bottom of the sheet would apply or should have been placed in front of each one of those differences.

Q. That is where the figure for the redispatch is greater than the figure for the actual?

A. Yes.

Q. Here I see no substantial difference as to the South Line. Was the South Line redispatched in this particular item No. 6 of exhibit No. 196?

A. No, we didn't perform any redispatch study but we included the statistics on here in order to give us a showing which would be comparable to the other two showings.

Q. The South Line statistics are included on each of the other showings corresponding to exhibit No. 242?

A. Yes.

Q. Has this exhibit been compared to determine whether it is correct?

A. It has.

Q. Have the computations and additions, subtractions, and multiplications been checked?

A. They have.

[fol. 3412] Q. Will you say whether or not it is true and correct?

A. It is.

Q. I take it that its purpose is as already explained in connection with the exhibit No. 226 and No. 236?

A. Yes.

Mr. Mason: Have you any questions, Mr. Strouss?

Mr. Strouss: No questions.

Mr. Mason: Has your Honor?

The Court: No questions.

Mr. Mason: We offer the exhibit in evidence as defendant's exhibit No. 242.

Mr. Strouss: Same objections.

The Court: Objections overruled, it may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 242.")

The Court:

Q. Mr. Sines, for the record will you indicate on this exhibit No. 242 just where the figure "I" indicating increase should appear in column F and I will ask the clerk to make the proper notation on his copy as I will on mine.

A. In the line entitled "Decrease for period" in the following subdivisions indicate with the Roman numerals [fol. 3413] I, II——

The Court: That will be opposite 17.2?

A. Yes.

The Court: All right, go ahead.

A. In subdivision II, 19.4; in subdivision III, 20.9; in IV, 15.3; in VI, 18.3; in V also because there were no Strauss turnarounds in actual performance whereas we ran some on the redispatch so that is an outright increase opposite the 88.1.

The Court: Any on the South Line?

A. No, but in the final summary in subdivision XI, opposite 16.2.

Mr. Mason:

Q. Will you take up now a statement in four sheets entitled, "Arrival Time at El Paso, Texas, of Fruit Blocks and Manifest Sections, April 4th to May 1st, Inclusive, 1940," and also headed "Redispatched AC Power." I take it this also contemplates the use of longer sidings?

A. That is right.

Mr. Mason: May we have this exhibit marked "Defendant's Exhibit No. 243" for identification?

The Court: It may be marked.

The Clerk: Defendant's exhibit No. 243 for identification.

Mr. Mason:

Q. Did you prepare or cause to be prepared defendant's [fol. 3414] exhibit No. 243?

A. I did.

Q. From what sources?

A. From the actual and redispatched train sheets.

Q. Is this exhibit similar in form to the preceding exhibit showing arrivals at El Paso?

A. It is.

Q. No. 237 and No. 227 particularly?

A. That is right.

Q. Will you say whether or not it was prepared in the same manner?

A. It was.

Q. I take it that the computations or showings of hours and minutes in columns F and G on sheets Nos. 2, 3, and 4 are predicated upon the times shown in columns C and E?

A. That is right.

Q. Then you summarize that entire showing on sheets Nos. 2, 3, and 4 in the block on the first sheet?

A. Right.

Q. Were there any operations of trains either actual or redispatched at El Paso into the ice house tracks as against operations into the train yard?

[fol. 3415] A. No.

Q. What is the point of arrival of these trains actual and redispatched at El Paso?

A. Octavia Street yard.

Q. Has the exhibit been checked against the underlying sources?

A. It has.

Q. Will you say whether or not it is true and correct?

A. It is.

Mr. Mason: Have you any questions, Mr. Strouss?

Mr. Strouss: No.

Mr. Mason: Your Honor?

The Court: No.

Mr. Mason: We offer the exhibit in evidence as defendant's exhibit No. 243.

Mr. Strouss: The same objections as to the preceding exhibits.

The Court: Objections overruled, it may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 243.")

The Court:

Q. Mr. Sines, referring to this exhibit No. 243, I notice that your long train operations under ideal conditions that [fol. 3416] you get those trains into their destinations in advance of the actual operations the greater portion of the time?

A. That is right.

Q. Whereas in the previous exhibits in response to the question from the Court I believe you admitted that the so-called "long train operation" slowed it up due as you said then to your short sidings?

A. That is right.

Q. Now, with this exhibit you have your ideal conditions of long sidings and heavier power you make better time apparently, at least it is so reflected in this exhibit?

A. That is right.

Mr. Mason:

Q. Mr. Sines, is it possible by comparing exhibit No. 243 with exhibit No. 237 to have some comparison of the number of trains actually operated, the number of trains which would have been operated if the law had been completely observed and the number of trains which would have been operated if the long sidings and heavier power had been available?

A. Yes.

Q. Where do you find that comparison?

A. On exhibit No. 237 in line 3 redispatch we find 185 [fol. 3417] which is the number of trains which would have been operated had we complied with the provisions of the law.

Q. Is that correct or is it in line 2, number of trains arriving El Paso?

The Court: Possibly the witness didn't understand the question.

Mr. Mason: I referred not to the number of blocks but to the number of trains.

A. That is right. The answer to that is you cannot tell by looking at exhibit No. 237 what the difference in trains was eastward. I don't know that that is responsive to your question.

Mr. Mason: You can tell by looking at No. 237 and No. 243, can you not, the number of trains in which the traffic was carried which actually arrived at El Paso as compared with the number of trains in which the traffic was carried which arrived at El Paso on either of the redispatch studies?

A. Yes, you can.

Q. That is shown on the face of the exhibit, is it not?

A. Yes, there were 165 trains that actually arrived at El Paso on both studies. There were 165 trains that ar-
[fol. 3418] rived at El Paso on the first redispatch study and there were 132 trains arriving El Paso on the second redispatch study.

Q. Will you say whether or not this lesser number of trains arriving at El Paso on the second redispatch study reflects a lesser number of trains operated in the territory west of Lordsburg?

A. Yes, in the second redispatch study the operation was a through, continuous operation.

Q. I take it by reference to exhibit No. 234 you can compare the number of eastbound trains operated during the long train period of April, 1940, in the territory between Yuma and Lordsburg which handled this eastbound traffic?

A. That is right.

Q. Mr. Sines, referring again to line 2 of the summary on exhibit No. 243, does the lesser number of trains arriving El Paso as shown there reflect a lesser number of interferences with the movement of those trains over the line betwen Yuma and El Paso?

Mr. Strouss: I object to that as calling for a conclusion. The exhibits are in here which speak for themselves.

The Court: Yes, the objection is sustained.

Mr. Mason: Perhaps what I asked for was in a sense elementary, Mr. Sines.

[fol. 3419] Q. As reflecting or indicating the effect of trains upon number of interferences, suppose we have a dis-

trict such as the district between Yuma and Gila or between Douglas and El Paso where there is only one freight train in each direction per day, how many meets will there be?

A. One.

Q. At most?

A. Yes.

Q. Suppose that the number is increased so there are two trains in opposite directions during the same period and they all have to meet, how many meets will there be?

A. Four.

Q. If the number is again increased to three in each direction, how many will there be?

A. Nine.

Mr. Strouss: That depends on whether they are running during the same period of time.

Mr. Mason: That is part of the assumption, that they are running during the same period of time.

A. That is right.

Q. Of course, meets could be avoided by running all of the eastward trains at night and all of the westward trains in the daytime?

[fol. 3420] A. Yes.

Q. If you could operate in that way?

A. Yes.

Q. Could you operate in that way?

A. Not practically.

Q. If you were to take a longer district, for example, as between Yuma and Lordsburg, you couldn't possibly get all your trains in one direction over the line before all the westward trains had to start or all the westward trains over the line before the eastward trains had to start, could you?

A. No.

Q. Will you say whether or not it is the general rule that a multiplication or an increase of the trains in opposing directions produces a disproportionate increase in the number of meets roughly equivalent to the square or product of the trains in the opposing directions?

A. That is the relationship, yes.

Q. Referring again to exhibit No. 243, would the lesser number of trains arriving at El Paso on the redispatch as indicated on the face of the exhibit as compared with

the number of trains actually arriving betoken more or less interference by reason of meets and passes?

[fol. 3421] Mr. Strouss: Your Honor, we have had exhibits in here as to meets and passes; they have one up there on the board now.

The Court: I will overrule the objection, he may answer.

A. Yes, it does.

Mr. Mason:

Q. More or less?

A. More.

Q. Will you turn now to a statement in three sheets bearing title, "Arrival Time at Yuma, Arizona, of 'SSW' and 'GBW' Westward Manifest Trains, Actual Operation Compared with Redispatched Operation, with No Restriction and Using AC Power and Long Sidings"?

A. Yes.

Mr. Mason: May we have this marked "Defendant's Exhibit No. 244" for identification?

The Court: It may be marked.

The Clerk: Defendant's exhibit No. 244 for identification.

[fol. 3422] Mr. Mason: Did you prepare Exhibit No. 244, Mr. Sines?

A. It was prepared under my direction and supervision.

Q. From what sources?

A. From actual and redispatch train sheets.

Q. Does this exhibit correspond in general to exhibits Nos. 238 and 228?

A. It does.

Q. Did you follow the same methods?

A. Exactly.

Q. And make the computations in the same manner as already explained in connection with exhibits Nos. 238 and 228?

A. Yes, sir.

Q. Is the exhibit true and correct, to the best of your knowledge?

A. It is.

Mr. Mason: Have you any questions, Mr. Strouss?

Mr. Strouss: No.

Mr. Mason: Any questions by the Court?

The Court: No.

Mr. Mason: We offer the exhibit in evidence as No. 244.

Mr. Strouss: The same objection.

The Court: The same ruling. It may be admitted.

[fol. 3423] (The document referred to was recived in evidence and marked "Defendant's Exhibit No. 244.")

Mr. Mason: Will you turn to an exhibit in one sheet entitled "Redispatch Study Wage Data, Yuma, Arizona, to El Paso, Texas, for Period April 4th to April 30th, 1940. Actual Operation Compared with Redispatched Operation, with No Restriction and Using AC Power and Long Sidings."

A. Yes.

Mr. Mason: May we have this statement marked No. 245?

The Court: It may be marked.

The Clerk: Defendant's Exhibit No. 245 for identification.

Mr. Mason: Did you prepare Exhibit No. 245 for identification, Mr. Sines?

A. It was prepared under my direction and supervision.

Q. Did you check it against the underlying sources?

A. I did.

Q. What are those sources?

A. The white work sheets A.

Q. Was this prepared from the entries on the white work sheets A of wage statistics in the same manner as Nos. 239 and 229?

[fol. 3424] A. Yes.

Q. You have used the same method indicating the totals and in applying the railroad retirement and unemployment insurance tax rates, as shown in line 12?

A. That is right.

Q. Will you explain just what was done in obtaining the variable items in columns D and H for the redispatched lines on the exhibit?

A. The variable amounts in the actual operations were reduced by the proportion of reduction of train-miles, first setting aside certain constant items and then adding those constant items back, such as switching at Gila and Lordsburg.

Q. Now, as to the enginemen's variable wages, did you use the locomotive-miles ratio?

A. Yes.

Q. Is the exhibit true and correct, according to the best of your knowledge and belief?

A. It is.

Mr. Mason: Have you any questions, Mr. Strouss?

Mr. Strouss: No.

Mr. Mason: We offer the exhibit in evidence as No. 245.

Mr. Strouss: The same objection.

The Court: The objection is overruled. It may be ad-
[fol. 3425] mitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 245.")

The Court: I notice the net result of this exhibit No. 245, Mr. Sines, is to increase the savings on wages as compared to Exhibit No. 239 by approximately three or four times?

A. That is right, and they are additive in this way, by adding the two together we get the difference between short train operation under the law and long-train operation with long sidings and big power for that 27-day period.

Mr. Mason: Now, going back to Exhibit 239, Mr. Sines, do I understand that the figure of $128,092 shown in the summary block 10 of the exhibit is the amount of wages, exclusive of tax, which would have been paid if the law had been fully observed?

A. Yes.

Q. And the amount of $103,508.99 in block 11 on exhibit No. 245 is the amount which would have been paid as wages, exclusive of tax, if long sidings and AC power had been used, and the law had not been observed?

A. That is right.

Q. It appears that the figure of $122,582.60 representing
[fol. 3426] actual wage payments is common to both exhibits?

A. That is right.

Q. To use a figure of speech, is that the center point from which you figure each way to the other results?

A. That is right, that is a good illustration.

Q. Is that what you had in mind when you said the figures were additive?

A. Yes.

Q. Is there any other feature of exhibit 245 to which you wish to draw attention?

A. Only to call attention to a computation which the Judge had me make in connection with exhibit 239 in order to refer back to exhibit 229. Half of the saving for the period in column L on exhibit 229 was $24,000, representing one month's savings, and here, in April, 1940, by adding these two figures together, we get something over $25,000, an exactly comparable item, short train operation compared with long train operation.

Q. And have you, Mr. Sines, an exhibit bearing the title "Statistics in Connection With Passenger Trains Exceeding Fourteen Cars in Length Operated During March and April, 1940?"

A. I have.

[fol. 3427] Mr. Mason: May this be marked 246 for identification, if your Honor please.

The Court: It may be marked.

The Clerk: Defendant's Exhibit No. 246 for identification.

Mr. Mason: Did you prepare exhibit 246, Mr. Sines?

A. It was prepared under my direction and supervision. I have checked it and it is correct.

Q. From what sources was it prepared?

A. From the train sheets for March and April, 1940, supplemented by a review of the passenger conductor's wheel reports for the same period.

Q. I take it that Exhibit 246 for identification does not relate to any redispatching study concerning which you have just been testifying?

A. None whatsoever.

Q. It is based entirely on train sheets as supplemented by the passenger wheel reports?

A. Right.

Q. Now, precisely what have you done on this exhibit?

A. I have indicated the trains which operated in excess of fourteen cars within the boundaries of the state of Arizona during the months of March and April; I have com- [fol. 3428] puted the train miles that those trains negotiated and the car-miles accumulated during the time and only the time that their consist exceeded fourteen cars.

Q. If a train operated in the State of Arizona as for example No. 2, for only a portion of the distance across the

state, and for the balance of the distance across the state had fourteen or less cars, do you show any statistics with relation to the latter operation; that is, for the operation of fourteen cars or less?

A. No.

Q. And this includes only statistics of operation of passenger trains having fifteen or more cars for the period while they had that many cars?

A. Yes.

The Court: What actual period is covered here by this exhibit; from what date in March to what date in April?

A. I don't know what those are. I would have to look at our records to tell; I don't have it here available.

Mr. Mason: Approximately the 5th of March to the 27th of April?

The Witness: I seem to remember the 5th of March in connection with the passenger train that was testified to, [fol. 3429] and that was the first long train that was operated in Arizona.

The Court: And the passenger operations continued up until the 27th day of April, when you stopped your long freight train operations?

A. I can't answer that.

Mr. Mason: Now, how do you compute the train-miles shown here, Mr. Sines?

A. Well, just from the timetable distances between the stations between which the trains operated with over fourteen cars.

Q. The number of times that the operation was undertaken is shown in column C, headed "Times"?

A. That is right.

The Court: Mr. Sines, for your information and that of counsel, the complaint in this case, the second cause of action, indicates that the date was March second rather than March fifth.

The Witness: That was the first train, I know that.

Mr. Mason: Now, how do you obtain the car-miles shown here?

A. By examining the consists or the conductors' wheel reports, we determine the number of cars in excess of four-

teen cars and multiply those by the train miles negotiated, thus producing the car-miles.

[fol. 3430] Q. Now, do these car-miles in column E represent only the car-miles made by trains during the time that their consist exceeded 14 cars?

A. Exactly.

The Court: The other normal operations are not included in this exhibit?

A. No. For instance, look at the second item under Train 44. It says, "Yuma to Phoenix," and "Tucson to Arizona-New Mexico State Line." For that part of the train's operation between Phoenix and Tucson, neither the train-miles nor car-miles were computed, nor do they appear on this exhibit, because at that time the train had fourteen or less cars.

The Court: But this exhibit does cover all passenger operations in excess of fourteen cars to the train anywhere within the state of Arizona, both including the Phoenix line and the south line by Douglas?

A. That is right.

Mr. Mason: Now, suppose a train contained fifteen cars, Mr. Sines, and operated from Tucson to Phoenix, 121 miles, would the number of car-miles accumulated as shown here be fifteen times 121?

A. Yes.

[fol. 3431] Q. Not merely the excess over fourteen?

A. No.

Q. Mr. Sines, do you recall whether there was during the period covered by this exhibit one occasion where two trains, neither of them exceeding fourteen cars, were consolidated into a single train by reason of an engine failure?

A. That did happen, and account of that occurrence is not taken on this exhibit.

Q. Where did the engine failure occur, if you recall?

A. At Dock, Arizona, on a westward passenger train.

Q. And what happened then?

A. The train was consolidated with an immediately preceding or following passenger train and taken into Phoenix, a distance of approximately forty miles.

Q. Was that a case of engine failure between terminals?

A. Yes.

Mr. Mason: Your Honor will recall that the law exempts engine failures between terminals from the operation of the statute.

Q. You didn't take that into account in this showing here at all?

[fol. 3432] A. No.

Mr. Mason: Have you any questions on the exhibit, Mr. Strouss?

Mr. Strouss: Yes.

Q. In the first item there is 435 train-miles and 6,646 car-miles. That would indicate a train of fifteen cars with 121 car-miles in addition. Would that mean that there had been a car put on that train at Phoenix perhaps, and brought to Tucson, and then dropped, making sixteen cars for that distance?

A. Yes, that would be a pretty good guess, Mr. Strouss.

Mr. Strouss: That is all.

Mr. Mason: Has your Honor any questions?

The Court: No questions.

Mr. Mason: We offer the exhibit in evidence as Exhibit 246.

Mr. Strouss: The same objection.

The Court: The objection is overruled. It may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 246.")

Mr. Mason: That concludes the exhibits, your Honor that we now have ready for introduction by Mr. Sines. We have [fol. 3433] a number of other exhibits in preparation for introduction by him, and except for the distance between here and San Francisco in connection with the reproduction, we would have them here today, but I doubt if we can have them before Tuesday.

The Court: You suggest then, Mr. Mason, that we recess until next Tuesday morning?

Mr. Mason: Yes, sir. I think that that would be in the interest of expedition and would enable us to have our exhibits in the proper form at that time.

The Court: You have no objection, Mr. Strouss?

Mr. Strouss: No, that is agreeable.

The Court: I understand from you that you still will be able to complete your defense by the end of our court session next week?

Mr. Mason: We expect to close our case in chief barring some unusual developments by Friday night of next week, starting on Tuesday morning; subject, of course, to the cross-examination which opposing counsel has suggested that he defer, and any redirect that we may have.

The Court: Then the hearing, the trial of this matter will be recessed until Tuesday morning, February 4th, 1941.

[fol. 3434] February 4, 1941, ten o'clock A. M.

Proceedings were resumed at this time as follows:

The Court: Whenever you are ready, you may proceed.

Mr. Mason: We will have to interrupt the course of Mr. Sines' testimony for a moment, to put on a witness who is here from San Francisco with one exhibit. I will call Mr. Barker.

LESLIE E. BARKER was called as a witness on behalf of the defendant and, being first duly sworn, testified as follows:

Direct examination:

By Mr. Mason:

Q. Please state your name and residence to the reporter, Mr. Barker.

A. Leslie E. Barker; Oakland, California.

Q. Where are your headquarters, Mr. Barker?

A. 65 Market Street, San Francisco.

Q. What is your position with the Southern Pacific Company?

A. I am office manager for the general superintendent of motive power.

Q. Are you in the headquarters of the motive power and [fol. 3435] mechanical department at San Francisco?

A. Yes, sir.

Q. You say general superintendent of motive power. You mean of the Southern Pacific Company?

A. Of the Southern Pacific Company, yes, sir.

Q. In your position as office manager, are you familiar with the records maintained in the motive power department?

A. Yes, sir.

Q. Will you describe the character of the records maintained in the motive power department with respect to the freight cars owned by Southern Pacific Company?

A. Well, we maintain a physical record of freight cars which shows the specifications of the cars and any changes that might be made in them after they had been placed in service.

Q. Are those records maintained by classes of cars distinguishing boxcars from stockcars, gondola cars, tank cars, and so forth?

A. Yes, sir.

Q. Is there an individual record for each car, according to its number and identification?

A. Yes, sir.

Q. Now, suppose that a car is taken to the shop and some actual change is made in the appliances on the car, [fol. 3436] as, for example, in the wheels, brake installation or draft gears; do you maintain a record of such changes?

A. We maintain a record of any physical change in the car. In other words, changing the type of the apparatus on the car. Where it is repaired in kind, and turned out the same way as it came in, we don't record that in our office.

Q. From what source do you obtain your information as to these physical changes, if any?

A. It is reported to us by the shop that does the work.

Q. Are those reports made to your office in the regular and ordinary course of business?

A. Yes, sir.

Q. Then what do you do with those reports; do you make entries from them?

A. We make entries from those of repairs into the permanent record describing the equipment.

Q. Have you before you a statement in one sheet entitled "Southern Pacific Company, Pacific Lines, Freight Cars Equipped with Friction Draft Gear, January 1, 1941?"

A. Yes, sir.

Mr. Mason: May this statement be marked, your Honor, defendant's Exhibit 247 for identification?

[fol. 3437] The Court: It may be marked.

The Clerk: Defendant's Exhibit No. 247.

Mr. Mason: Did you prepare Defendant's Exhibit No. 247 for identification, Mr. Barker?

A. It was prepared under my supervision.

Q. Was it prepared in the office of the general superintendent of motive power?

A. Yes, sir.

Q. From what sources was it prepared?

A. Well, it was prepared from our permanent records describing the freight-car equipment.

Q. Have you those permanent records in so far as they were used in obtaining these figures upon this exhibit in Tucson with you?

A. Yes, sir.

Q. Are they available for the use of Mr. Strouss if he wishes?

A. Yes, sir; there is part of them here in the court room.

Q. You have part of them in the court room?

A. Yes, sir.

Q. And the balance of them are where?

A. In the office——

Q. Across the street?

A. Yes, at 90 Church Street.

Q. I take it that the information shown in column 1 of [fol. 3438] the exhibit is simply a description by types of the various classes of freight-car equipment, is that it?

A. Yes.

Q. Where do you get the information contained in column 2? What does that indicate?

A. It is right out of these books here, that is, the number of cars owned. In other words, it is the physical record of freight equipment. When any new cars are purchased we enter them in the books, and when the cars are destroyed or otherwise disposed of, sold, or taken out of service, they are written out of the books. The books are balanced every month as to our total ownership of cars.

Q. Where do you get the information in column 3? Is that from the same sources?

A. That is entered in the books here under the description of the car of any change that might have been made in it.

Q. Do you make an individual check of the record on each car?

A. They make a count from the books of the cars.

Q. As to column 4, is that your own computation?

[fol. 3439] A. Yes, that is percentage.

Q. I take it that the totals are simply the addition of figures appearing above?

A. That is right.

Q. I notice also that the exhibit shows a substantial number of cars, as interchange cars, and then there is a somewhat smaller number appearing "Cars Confined to Home Lines." Are these interchange cars those which move in service beyond the Southern Pacific Lines?

A. Yes, they are cars that were in general service, may be loaded at any point.

Q. As to cars confined to home lines, what particularly is their distinction?

A. The distinction there, these logging cars are used, the majority of them, up in Oregon in the lumber districts. They run on these little branch lines, they don't get off our line.

Q. Are they restricted to branch-line logging service?

A. I couldn't say whether they are restricted to that service or not, but I know they don't get off our line; caboose cars that are used by our crews, they don't get off our line; the narrow-guage line, that is a little narrow guage up in Nevada, they don't get off our line.

[fol. 3440] Q. Has the exhibit been checked against the underlying sources to determine its correctness?

A. Yes, sir, it has been carefully checked.

Q. Will you say whether or not it is true and correct?

A. To the best of my knowledge and belief it is true and correct.

Mr. Mason: Have you any questions, Mr. Strouss?

Mr. Strouss: No questions.

Mr. Mason: Has your Honor?

The Court: No.

Mr. Mason: We offer the exhibit in evidence as defendant's exhibit No. 247.

Mr. Strouss: No objection.

The Court: It may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 247.")

The Court: Mr. Barker, do I understand from your testimony that all of these cars shown in column 3 which purport to be equipped with the friction draft gear are equipped with any particular type of gear, for instance, M-17, or does it vary in different types?

A. They are equipped with any of the recognized types of friction draft gear.

[fol. 3441] Q. And no distinction is made on your records as to what particular type?

A. There might be a few cases where the distinction doesn't show but ordinarily the distinction is made and shows whether it is a Cardwell or Miner or whatever it might be. It is written right in here when the cars are bought and will show the type.

Q. These are equipped with standard draft gears?

A. Yes, sir, you can glance through these books and see them if you like.

Mr. Mason: That is all the questions I have.

Mr. Stronss: You haven't made any distinction on this exhibit, have you?

A. No, because they just asked for friction draft gears and that it what it is.

Mr. Stronss: I have no further questions.

(Witness excused.)

Mr. Mason: We will recall Mr. Sines.

[fol. 3442] B. S. Sines resumed the witness stand for further

Direct examination (continued).

By Mr. Mason:

Q. Mr. Sines, I want to call your attention first to exhibit No. 237. On the front page of exhibit No. 237, the first sheet, summary sheet, it is indicated that forty of the redispatched blocks made a better arrival time at El Paso than the actual blocks, this being the operation during the long train period of April, 1940, when certain trains were operated without regard to the 70-car restriction. I will ask you whether you made an investigation of the record of the actual operation of these particular forty blocks and

what your investigation shows as to the schedule performance?

A. I have made such an investigation and the investigation is based upon the departure time from Tucson, Phoenix, Yuma, and Colton, the points where those particular blocks originate and from which the perishable schedules are computed. In other words, on each one of those forty blocks I went back to the departure from the originating terminal and computed the schedule in due time across to El Paso.

[fol. 3443] Q. What did you find as to schedule performance of the actual blocks?

A. I find as to the actual blocks that they all arrived at El Paso, Texas, ahead of their due time except for five blocks.

Q. This was an actual operation with trains in excess of 70 cars, as the case might be?

A. Yes, during that time we were running long trains.

Q. What as to the five which did not arrive in accordance with schedules?

A. One of them was five minutes late at El Paso; it arrived at 9:25 and it was due at 9:20 P. M. Another one was fifteen minutes late; it was due at 11:30 A. M. and it arrived at 11:45. A third one was fifteen minutes late, due in El Paso at 11:30 and arriving at 11:45 A. M. The fourth one was an hour and thirty minutes late, due at 11:30 A. M. and arriving at 1 P. M. The fifth was two hours and forty minutes late, due at 11:45 A. M. and arriving at 2:25 P. M.

Q. As to the redispatched operation, where these same blocks were operated, and all other trains at the same time were operated, having in mind the 70-car restriction, did you investigate to determine whether these five late arriv-

[fol. 3444] als on schedules made arrival on schedule when they were redispatched?

A. I did.

Q. What was the result of that investigation?

A. The three which were five minutes, fifteen minutes, and fifteen minutes late at El Paso arrived at El Paso ahead of schedule on our short train redispatch. The other two which were considerably later than that failed to arrive at El Paso on schedule on the short train redispatch in the same manner that they failed to arrive there in actual

operation. The last two that I speak of did make somewhat better performance into El Paso, amounting in one case to forty minutes and in the second case to thirty minutes, due to a change in the opposition and interference and operating conditions surrounding the movement of the trains on the redispatch as compared with what had happened in actual operation.

Q. Will you turn to exhibit No. 241?

A. There is one other point I would like to add.

Q. Have you any further explanations to make in connection with exhibit No. 237?

A. We are talking about forty fruit blocks that arrived at El Paso on our short train redispatch in advance of their [fol. 3445] actual time, during which time we were running long trains. Of those forty trains, we had the following number of trains exceeding 70 cars at some time in their operation between Yuma and El Paso—nine trains.

Q. Nine trains of the forty actually had more than 70 cars during the operation between Yuma and El Paso?

A. Yes, the others whose performance was somewhat less favorable on the short train redispatch than on the long train operation were short trains also, that is, they were shorter than 70 cars.

Mr. Mason: Will you read that last answer, please?

(The last answer was read by the reporter.)

The Witness: Short trains in actual performance as well as in redispatch performance.

Mr. Mason:

Q. Their performance actually was somewhat worse than the redispatch performance?

A. Yes.

Q. Then I understand the situation is depicted on exhibit No. 237 correctly?

A. Yes.

Q. And not as you have just stated?

A. Yes.

Q. Is that all you have in connection with exhibit No. 237 [fol. 3446] at this time?

A. That is all.

Q. Will you turn to exhibit No. 241. At pages 3406 and 3407 of the transcript your attention was called by the

Court to the fact that the exhibit shows progressively longer trains in the territory affected by the Arizona law as one moves eastward from Yuma toward El Paso, the Court's question having particularly to do with the showing in the upper or westward block of the exhibit and of course relating to the showing of the redispatch operation. Have you made an investigation to determine just what factor, if any, may have contributed to the difference in the lengths of the redispatched trains particularly eastward and westward of Tucson?

A. I have.

Q. Will you make such explanation as your investigation has enabled you to make?

A. I would like to discuss exhibit No. 241 from the standpoint of a comparison with exhibit No. 215 to show just what happened at Tucson and Gila with respect to westbound operation. In June and August, 1938, there was a slight increase in the number of cars per train westbound at Gila, the average cars per train on the redispatch in- [fol. 3447] creasing from 92.8 to 93.0. There was a slight decrease at Tucson, the average cars per train falling from 93.2 to 92.8. On exhibit No. 241, however, there was a continuing decline in the length of trains at Tucson and Gila. At Tucson the decrease was 2.1 cars and at Gila, 4.7 cars. Upon investigation I found that the principal difference between 1938 and April, 1940, was a slag hauling job that the railroad was engaged in in 1940, during which time we were hauling a considerable number of cars of slag from Douglas, Arizona, to the west end of the Tucson division for ballast purposes. These cars of slag are somewhat heavier than ordinary westbound tonnage, ordinary westbound cars, and resulted in shorter trains being operated out of Tucson. Then when we got to Gila the cars continued through and we set out and emptied them between Gila and Yuma and the cars never got into Yuma. They were later picked up and moved again eastbound into Gila and on into Tucson. The average cars per train shown on both exhibits No. 215 and No. 241 are on the basis of a count made of cars in trains coming into the terminals. These cars having been set out east of Yuma didn't give us an opportunity to include them in our average cars per train. [fol. 3448] Q. Between Gila and Yuma?

A. Between Gila and Yuma.

Q. Because that would be based upon the count as you entered Yuma?

A. Yes. On the other hand, going eastward, the lower part of exhibit No. 241, the cars would be counted into Gila and they would be counted again coming into Tucson.

Q. They would not be counted going out of Tucson eastward?

A. No.

[fol. 3449] Q. Does that account for the difference between the eastward trains into Tucson and the eastward trains out of Tucson to any extent on Exhibit 241?

A. That would influence that difference a little bit, but there is still another reason to assign for that as to 1938 and 1940.

Q. I want to make it clear. This ballast movement in April, 1940, was entirely company material moving for ballasting the right-of-way of the railroad?

A. Yes.

Q. What is the reason for this falling off of 83.2 cars into Tucson and 77.7 cars into Lordsburg, as shown in the lower block, or eastward movement, on Exhibit 241?

A. There again I would like to discuss that from a standpoint of comparison of Exhibit 215. Exhibit 215 indicates that eastward there was an increase in the number of cars per train from Tucson for June and August, 1938, whereas, as Exhibit 241 indicates, there was a decrease in April, 1940, on our redispatch. Both tendencies are shown, although they are not so marked in actual operation. In 1938, and again in 1940, the reason for the change is due to a change in operating conditions with respect to A [fol. 3450] blocks. Those are the perishable blocks originating in the Phoenix territory. In 1938, the A blocks coming into Tucson arrived at such a time that it was possible to consolidate them with T. X. M. Tucson manifest, with cars off the Tucson manifest train at Tucson, and build up the train east of Tucson. In 1940, however, the A blocks were arriving in advance of the T. X. M. trains, or vice versa, the T. X. M. trains were arriving late from California, and it wasn't possible to make that consolidation, and the trains containing A blocks went east of Tucson with relatively light loads and a relatively small number of cars, which would have the effect of pulling down the average cars per train between Tucson and Lordsburg.

Q. Does that conclude your answer on those two exhibits?

A. Yes.

Q. Have you an exhibit in one sheet entitled "Total Road Mileage as of December 31, 1939, and Freight Train Car-Miles and Revenue Passenger-Miles Operated During Year 1939, Class One Railroads of United States and of Certain Railroads Concerning Which Individual Witnesses Have heretofore Testified on the Subject of Operating Costs"?

[fol. 3451] A. I have.

Mr. Mason: May we have this statement marked No. 248 for identification?

The Court: It may be marked.

The Clerk: Defendant's exhibit No. 248 for identification.

Mr. Mason: How was this exhibit prepared, Sines?

A. This exhibit was prepared from an inspection of the transcript of the record in this case, from an inspection of the exhibits already introduced, and by abstracting figures from preliminary abstract of the I. C. C. statistics of railways for the year 1939.

Q. I take it that the columns A, B, and C are simply transcript references, are they?

A. That is right.

Q. And column D indicates the subject matter or the particular railroad concerning which the witness named in column A testified?

A. That is right.

Q. Now, as to column E, is that also a figure taken from Exhibits or testimony already of record?

A. That is from the exhibit listed in column F.

[fol. 3452] Q. In the corresponding line?

A. Yes.

Q. Now, are these figures in column G taken directly from the Interstate Commerce Commission's published abstract?

A. Yes.

Q. Is that a copy of the same publication referred to in the testimony of Dr. Parmalee?

A. That is right.

Mr. Mason: I think it has already been furnished to Mr. Strouss. If not, it is available.

The Witness: We have an abstract available for his use, yes.

Q. Are the figures in column I likewise taken from the abstract?

A. That is right. The page references in column H apply to both columns G and I.

Q. Do those figures appear, the figures of freight train-miles and passenger train-miles, both appear on those pages?

A. Yes.

Q. Are there any computations on the exhibit other than those which are identified in lines 19 and 20?

A. No.

Q. Will you say whether or not the exhibit has been [fol. 3453] checked and, as to the computations, whether they have been checked?

A. It has been checked and is correct.

Q. And will you state the purpose of the exhibit?

A. To indicate the representation which has been made, the scope of the representation which has been made by the witnesses from foreign lines in this case, and which is found in the percentages in columns E, G, and I, line 20.

The Court: In other words, Mr. Sines, from this exhibit it would appear that there has been produced here witnesses from these sixteen lines other than the Southern Pacific?

A. Including the Southern Pacific.

The Court: I think there are sixteen besides that.

The Witness: Excuse me.

The Court: That represents better than half of the railroad mileage of the United States?

A. Yes.

Mr. Mason: Have you any questions on the exhibit, Mr. Strouss?

Mr. Strouss: No.

Mr. Mason: Has your Honor any further questions?

The Court: No.

[fol. 3454] Mr. Mason: We offer the exhibit in evidence as No. 248.

Mr. Strouss: We have the same objection as made to the original exhibits shown in column F, with the same reasons, without restating them.

The Court: The objection is overruled. It may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 248.")

Mr. Mason: I take it, Mr. Strouss, that your objection is as to relevancy and materiality and not as to competency?

Mr. Strouss: I am not raising any question of competency, so far as failure to produce records is concerned.

The Court: This exhibit, in effect, is a summary of the testimony already introduced in this case?

Mr. Mason: Yes; and, as the witness explained, to indicate whether or not our showing as to the railroads of the United States is comprehensive or otherwise.

Q. Have you before you, Mr. Sines, a statement in four sheets entitled, "Southern Pacific Company, Pacific Lines, Comparisons between Tucson Division, Pacific Lines, and Salt Lake Division, Showing Trends in Freight Train [fol. 3455] and Locomotive Loading, and Effect on Fuel Consumption?"

A. I have.

Mr. Mason: May this statement be marked No. 249, your Honor?

The Court: It may be marked.

The Clerk: Defendant's Exhibit No. 249 for identification.

Mr. Mason: Did you prepare Exhibit No. 249, Mr. Sines?

A. I did.

Q. From what sources?

A. From forms 521 and 522.

The Court: Do I understand that those are reports submitted to the I. C. C.?

A. No, they are forms regularly compiled in the course of business by the Southern Pacific Company for the guidance of its operating officers and executives, and the figures that are included in forms 521 and 522 are later included in reports to the Interstate Commerce Commission in forms OS-A and in the annual reports. It all fits into the scheme of building up our final figures.

Mr. Mason: Are the forms 521 and 522 regularly prepared in the accounting department?

A. Yes.

[fol. 3456] Q. And from what general sources are they prepared?

A. From the documents of original entry coming into the accounting department, such as the conductors' wheel reports, the conductors' time return and delay reports covering wages, the reports on movement of trains and locomotives from the chief dispatchers' offices, the reports on material and supplies and prices coming from the mechanical and maintenance departments and the time reports from those same departments; and any other basic documents that represent expenditures of money, either for material or supplies, find their way into the figures compiled for forms 521 and 522.

Q. Do the forms 521 confine themselves to cost figures, or do they include also statistics of performance in the shape of locomotive-miles, car-miles, train-miles, and the like?

A. They include cost figures and the statistics which you have mentioned. The cost figures are those figures bearing directly on operation of freight and passenger trains, the direct expenses associated with the cost of performing transportation service.

Q. Does the form 521 bear a particular title?

A. It does and I have looked at it a thousand times, [fol. 3457] but I cannot tell you what it is.

Q. And the Form 522 which you mentioned, was that a predecessor carrying much the same information?

A. That was a predecessor of form 521.

Q. You have used the forms 522 and 521 previously in the preparation of other exhibits which have been offered and received?

A. Oh, yes.

Q. Will you explain what sheet 1 of exhibit 249 undertakes to show?

A. Sheet 1 is a summary of percentage figures which are developed on the succeeding three sheets.

Q. I will ask you to refer back to exhibit No. 179, introduced by Mr. Herbert?

A. Yes.

Q. Is your exhibit 249 for identfication prepared in somewhat the same manner as exhibit 179?

A. In exactly the same manner.

Q. Does it include the same or any additional statistics?

A. Mr. Herbert's exhibit 179 includes those operating costs which are shown on form 521, and which are identified as direct costs and he works with the total of those direct costs. My exhibit singles out the fuel item, per [fol. 3458] forms a similar analysis for fuel consumption.

Q. You don't undertake here to show cost?

A. No.

Q. What are you undertaking to show by Exhibit 249?

A. I am showing the percentage decrease in pounds of fuel per 1000 gross ton-miles.

Q. Your exhibit 249, then, is associated entirely with fuel consumption as related to performance?

A. Yes.

Q. Now, will you go to Sheet No. 2 and I will ask you first whether the figures in the lines for the several years shown in column A, those figures which appear in columns B to J, inclusive, are taken directly from the forms 522 and 521?

A. The figures in columns B to F are taken from forms 521 and 522, and columns G to J are computed, but the figure in column G and H may be found on form 522 and 521 also. In other words, I have checked the form 521 and 522 with respect to those items.

Q. You say column G represents the computations? Is that a division of other figures on the exhibit?

A. Yes, that is a division of the figures in column D by the figures in column B.

[fol. 3459] Q. How do you get the figures in column H? What computation do you make?

A. By dividing column E by column B.

Q. And the figures in Column I?

A. Dividing column E by column C.

Q. And finally the figures in column J, how were they obtained?

A. By converting net tons of fuel in column F into pounds of fuel and dividing by column E.

Q. Then there has to be an adjustment of the decimal point, I think, because this is a figure for a thousand gross ton-miles.

A. That is right.

Q. Now, having the figures above the lines, which horizontally cross the exhibit below the year 1939, what is the next step?

A. The next step was to group the years 1924-1925, 1928-1929, 1930-1931, 1938 and 1939 group the basic figures in columns B to F, the additions for which are shown on the exhibit or appear on the exhibit in the same columns and compute new averages in columns G to J.

Q. Was that done for each of the two-year periods that are shown with the words "Total"?

A. Yes.

Q. Then you show certain percentage changes. Are [fol. 3460] they computed?

A. Then the percentage changes in columns G to J are computed, comparing the first two-year period 1924-1925 with the second two-year period 1928-1929.

Q. Why did you with the Tucson division make a break in 1929 this way.

A. In July, 1930, the limits of the Tucson division were changed and the eastern end of the Tucson division was extended from a point immediately east of Tucson to Lordsburg. The period 1924-1929 therefore embraces a period during which the aspects of the Tucson division remained the same for the entire six years.

Q. Do the 1924 figures take into account the lines which were added in 1924?

A. Yes. The merger of the Arizona Eastern and the Southern Pacific occurred in the fall of 1924, but when our accounting department compiled figures for the year 1925, they restated the year 1924 on the 1925 basis, so that comparisons which they were then making between 1924 and 1925 would be on a comparable basis.

Q. In 1930 you say the change in the Tucson limits took place in the middle of the year?

A. Yes.

[fol. 3461] Q. Are the figures for 1930 restated in the same manner on the 1931 basis?

A. Then in 1931 the 1930 figures were restated so the years 1930, 1931 and subsequent years would be on a comparable basis with respect to the limits of the Tucson division.

Q. In the last line where you say "Total Per Cent Change," how do you get the total percentage?

A. By adding the percentages appearing above, that is, the percentage change for the period 1924-1929, plus the change for 1930 to 1939.

[fol. 3462] Q. Did you treat a decrease as having a minus sign for the purpose of that addition?

A. Yes.

Q. So that these additions are additions in the algebraic sense?

A. That is right.

Q. Going to sheet No. 3, will you state whether or not you followed a similar process there?

A. I did.

Q. Did you likewise follow a similar process on sheet No. 4?

A. That is right.

Q. Has the exhibit been checked and compared against the underlying sources?

A. It has.

Q. Have the computations been checked?

A. They have.

Q. Returning to the first sheet of the exhibit, as I read the exhibit the showing in column A on the first sheet is merely a repetition of what appears in the total line on sheet No. 2; is that correct? The final total line on sheet No. 2?

A. That is right, in column G on sheet No. 2.

Q. Columns G, H, I, and J, I think, are all repeated, are they not, in column A on sheet No. 1?

[fol. 3463] A. That is right.

Q. What is the purpose of exhibit No. 249?

A. The purpose is to establish a comparison in fuel consumption on the Tucson division, Pacific lines, and the Salt Lake division and to show trends in freight train and locomotive loading and their effect on the said fuel consumption.

Q. Does this exhibit afford a foundation for a further portion of your showing?

A. It does.

Mr. Mason: Have you any questions, Mr. Strouss?

Mr. Strouss: No questions.

Mr. Mason: Has your Honor any questions?

The Court: No questions.

Mr. Mason: We offer the exhibit in evidence.

Mr. Strouss: We make the same objection as previously made in the running objection as irrelevant and immaterial and calling for a conclusion and particularly to that part of the exhibit referring to the Pacific lines and the Salt Lake division.

The Court: Objection overruled, it may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 249.")

[fol. 3464] The Court: We will take our morning recess at this time.

(Thereupon a short recess was taken, after which proceedings were resumed as follows.)

Mr. Mason:

Q. Mr. Sines, have you before you a statement in one sheet entitled, "Yuma, Arizona, to Lordsburg, New Mexico, Fuel Consumption Comparisons and Estimated Economy Resulting from Adoption of Long Train Operation"?

A. I have.

Mr. Mason: May we have this statement marked "Defendant's Exhibit No. 250" for identification?

The Court: It may be marked.

The Clerk: Defendant's exhibit No. 250 for identification.

Mr. Mason:

Q. Did you prepare this exhibit No. 250?

A. I did.

Q. From what sources did you obtain the information shown in columns A, B, and C, lines 1, 2, 3, and 4?

A. Those figures are reproductions from the summary appearing on sheet No. 1 of the exhibit previously introduced, No. 249.

Q. Where did you obtain the figure in line 1, column D? [fol. 3465] A. That comes from summaries produced from our recapitulation sheets covering the June and August redispatch studies and shows what the result of long train operation would be in increasing the cars per train expressed as a percentage.

Q. Is that figure in column D, line 1, a comparison between the average train lengths of the actual and redispatched trains for June and August of 1938?

A. Yes, for the territory Yuma to Lordsburg.

Q. Will you refer back to exhibit No. 226, please?

A. I have it.

Q. Is there any way that the figure in column D, line 1, could be checked against exhibit No. 226, or, if that is not the correct exhibit, some other exhibit to obtain the figure?

A. No, that computation cannot be made directly, but taking the figures shown on exhibit No. 226 and making corrections for the number of cars, for the less number of cars handled on the redispatch than on the actual, the average cars per train for the territory Yuma to Lordsburg can be computed for both actual and redispatch and then the percentage change can be derived therefrom.

Q. That is, the basic figures from which this computation [fol. 3466] can be made are of record on exhibit No. 226, are they?

A. That is right.

Q. Where did you obtain the figure in line 2, column D, on exhibit No. 250 for identification?

A. There is one more feature that should be explained in connection with the figures in line 1, column D.

Q. Will you explain that, please?

A. That is that the percentages in column D refer to the Tucson division. I previously said the territory Yuma to Lordsburg, and it is the territory Yuma to Lordsburg insofar as our redispatching study is concerned, but the change in the average cars per train is the reflection that the redispatch study in the territory Yuma to Lordsburg has on the Tucson division average cars per train for June and August.

Mr. Strouss: You mean by that, including Phoenix?

A. Yes, the entire Tucson division.

Mr. Mason:

Q. Does the figure in line 2, column D, also relate to the entire Tucson division?

A. Yes.

Q. From what sources do you obtain that figure?

[fol. 3467] A. The actual performance for June and August, 1938, comes from the form 521. We then modify the form 521 figures by the changes brought about by our redispatch study and determine what the percentage change would have been actual performance compared with the

result after the changes of the redispatch study had been accounted for.

Q. I take it you have gross ton-miles between Yuma and Lordsburg as shown on sheet No. 2 of your exhibit No. 226?

A. Yes.

Q. Do you include in making the computation which leads to this figure the gross ton-miles made on the other parts of the division?

A. Yes, this is the entire Tucson division.

Q. How do you arrive at the figures in column D, line 3?

A. They are also the actual performance figures for the Tucson division for the months of June and August, 1938, modified by the reduction in locomotive-miles brought about by the redispatching study.

Q. Does this figure represent the comparison between actual and redispatch performance with those factors taken into account?

A. It does, it establishes the percentage relationship be- [fol. 3468] tween actual performance and the performance as it would have been had the long train operation prevailed.

Q. Will you explain how you derive the figure in line 4, column D?

A. The figure in line 4 is a judgment figure, taking into consideration the following factors: between 1924-1925 and 1938-39, the Tucson division increase in gross ton-miles per locomotive-mile was 3.96 per cent; on the Pacific lines it was 20.87 per cent; and on the Salt Lake division it was 36.57 per cent as indicated on this exhibit and on the previous exhibit No. 249. At the same time the improvements in fuel consumption were as shown by the percentages in line 4, comparing the combined period 1924-25 with the combination period 1938-39. We see, therefore, that the improvement on the Tucson division resulted in a decrease in fuel consumption of 12 per cent with an increase in locomotive loading of 3.96 per cent.

Q. Those figures are already of record on exhibit No. 249, are they?

A. That is right.

Q. And simply reproduced here as to columns A, B, and C?

A. Yes; ordinarily I don't like to read figures off the face [fol. 3469] of an exhibit, but I must explain the reasoning that led to the choice of the figure in column D, line 4. At

the same time the percentage improvement in fuel consumption on the Pacific lines was a decrease of 22 per cent accompanying an increase in locomotive loading of 20.87 per cent; while on the Salt Lake division there was an improvement in fuel economy of 26 per cent accompanying an increase in locomotive loading of 36 per cent. We make the redispatch study for June and August of 1938 and on top of the previous economy which had been achieved on the Tucson division we are able to superimpose the economy which will result by increasing the locomotive load.

Q. Then do I understand that line 3, column D, indicates the increase in locomotive load incident to the redispatch?

A. Yes, and whereas a difference of 17 per cent between Tucson division and Pacific lines found in line 3, columns A, B, produced a difference in fuel economy of, roughly, 10 per cent as between Tucson division and Pacific lines, and whereas a difference in locomotive loading of, roughly, 33 per cent as between Tucson division and Salt Lake division produced a fuel economy of 13.4 per cent as between Tucson division and Salt Lake division in column D, line 4, I [fol. 3470] indicate a conservative figure of 10 per cent which would follow the increase in locomotive loading as determined from the redispatch study.

Q. Now as to column E, line 1, column E, the figure shown there, where is that derived?

A. I will have to look at a work sheet to be positive of a figure which I have used and would like to take time to do that. The figure in column E, line 1, is derived by taking twenty-seven thirtieths or nine-tenths of the car-miles produced during April, 1940, and modifying those car-miles by the changes resulting from the April, 1940, redispatch study.

Q. Does this also relate to the performance on the Tucson division for the month of April, 1940, as affected by the redispatch long trains of that period into short ones?

A. That is right.

The Court:

Q. Mr. Sines, is there any relationship between the percentage shown on line 4 of column D and the percentage shown on the same line, column A?

A. There is this kind of a relationship; between 1924-25 and 1938-39 the improvement in fuel performance on the

[fol. 3471] Tucson division is as shown, 12.6 per cent. That has come about because of changes largely in the motive power used on the Tucson division, the appliances and the equipment furnished to those locomotives and the fact that the locomotives themselves now in recent years are bigger, larger, heavier, more efficient locomotives than they were in 1924 and 1925. That same improvement has taken place every place else on the Southern Pacific, our entire locomotive inventory has felt that same change. In addition to that 12.6 per cent on the Tucson division, there is still available another economy resulting from increase in train loading. The increase in train loading we measured, or the possible increase in train loading we measured with the redispatch study. We could still further increase the train load on the Tucson division by the percentage shown in column D, line 3, if it were not for the 70-car law. We have been able to increase the percentage loading on the Pacific lines by 20.87 per cent. We have been able to increase it on the Salt Lake division by 36 per cent. Therefore, I say in addition to the 12.6 per cent already achieved on the Tucson division we can still go out and for the purposes of my study claim at least the percentage improvement in [fol. 3472] column D, line 4, as the result of the increased trainloading still possible if the law were set aside.

Mr. Mason: Is it possible by a straight mathematical computation to obtain a figure in place of the figure which you do show in column D, line 4?

A. No, there is no mathematical computation like two times three are six which will produce that figure in column D, line 4. It is a judgment figure, taking into consideration the factors I have been talking about.

The Court: In effect your statement is that added to the 12.6 decrease in pounds of fuel consumption here there could be added an additional 10 per cent shown in column D on the same line?

A. Exactly.

Q. You have indicated your view of the relationship between those two figures that the Court asked you about. Is there even a more direct relationship between the other percentage figures shown on the same line in columns E, F and G?

A. Having established the figure in column D, line 4, I made the other figures in columns E, F, and G consistent.

In column V we have all the figures in column E representing the result of our first 1940 redispatch study when we [fol. 3473] made short trains out of long trains which had been operated during the period April 4th to 30th. That would result in a decrease in the locomotive loading and a comparable increase in fuel consumption. If a decrease in train loading in column D of 34.5 per cent——

Mr. Mason: (Interrupting) That is an increase I think, isn't it, in column D?

A. Right. If an increase in train loading of 34.5 per cent in column D, line 3, resulted in the figure in column D, line 4, then the decrease in train loading of the amount shown in column E, line 3, would produce the percentage shown in column E, line 4, just as a matter of proportion between the figures in line 3, columns D and E. In other words, one is about one-seventh of the other.

The Court: Do I take it from this exhibit on the Tucson division only oil-burning locomotives are used?

A. Yes.

Mr. Mason:

Q. Is that likewise true in the main as to the balance of the showing on the exhibit?

A. Well, the title of item 4 is, "Percent decrease in pounds of fuel per thousand gross ton-miles," and the ex- [fol. 3474] pression, "pounds of fuel per thousand gross ton-miles," is an item reported on the form 521 and I think that is also on form OS-A which we report to the Interstate Commerce Commission. The Southern Pacific and a few of the railroads in the western territory are oil burners. We convert that fuel oil to coal on ratios established by each one of the carriers themselves. It is not a constant ratio between all of the railroads, and we have continued to report oil as coal in order that all railroads in the United States might be talking in the same terms. The ratio is four barrels of oil equal one ton of coal.

Q. That is so far as our operations are concerned?

A. So far as our operations are concerned. It may be different on other railroads and it is different on some of the other railroads.

Q. I want to ask you this, Mr. Sines, if you had followed out the exact percentage decreases in fuel consumption per

thousand gross ton-miles which are indicated in columns B and C and applied the relationships between the figures in line 4 and the figures in line 3 in columns B and C in deriving the figure in line 4, column D, would you obtain a greater or less figure than you show in column D?

[fol. 3475] A. If I had depended on straight arithmetic, that would have been a larger figure.

Q. How much larger?

A. It would have been 11.2 per cent instead of 10 per cent.

[fol. 3476] Q. I take it, that in arriving at the figures in columns F and G, you followed the same process as you have described for column D?

A. That is right.

Q. Now, to refer to line 5.

A. Yes.

Q. Column H. Is that figure taken from actual records?

A. Yes, that is from the form 521.

Q. And line 6, column H?

A. Wait a minute, form 521 with respect to June and August, 1938, and twenty-seven thirtieths or nine tenths of the fuel consumed for April, 1930, for the figures in columns I, J and K, line 5.

Q. Now, in line 6, where do you get that price?

A. That is the charge-out price which the accounting department has used from month to month and year to year, a statement for which I have here with me.

Q. And that varies, does it, from month to month?

A. Yes.

Q. This figure in column H is the charge-out price, is it, for those two months?

A. That is the average for the two months, yes.

[fol. 3477] The Court: In other words, from an examination of the exhibit, on this particular line it would indicate that your oil was costing you more in 1938 than it was in 1940?

A. That is right.

Mr. Mason: Now, as to line 7, is that a computation?

A. That is a multiplication of the figures in the preceding two lines 5 and 6.

Q. Line 8, where is that taken from?

A. From the figures in the columns above in line 4.

Q. The corresponding figures in column D, E, F and G in line 4?

A. That is right.

Q. As to line 9, is that a computation again?

A. The application of the percentages in line 8 to the cost of fuel oil consumed, in line 7.

The Court: Is a barrel of oil measured in gallons or pounds?

A. Gallons.

Q. How many gallons in a barrel?

A. 42.

Mr. Mason: What is the purpose of exhibit 250 for identification, Mr. Sines?

A. To develop the fuel economy expressed in money in [fol. 3478] 9, columns H, I, J and K, for use in exhibits to follow, to develop the result of adoption of long-train operation.

Mr. Mason: Have you any questions, Mr. Strouss?

Mr. Strouss: No questions.

Mr. Mason: Has your Honor any further questions?

The Court: No.

Mr. Mason: Have the computations on the exhibit been checked, Mr. Sines?

A. They have.

Q. Will you say whether or not, from the mathematical standpoint, the exhibit is true and correct?

A. It is.

Mr. Mason: We offer the exhibit in evidence as defendant's exhibit No. 250.

Mr. Strouss: Objected to as irrelevant and immaterial, calling for a conclusion——

The Court: The objection is overruled. It may be admitted.

Mr. Strouss: —and purely speculative.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 250.")

Mr. Mason: Now, Mr. Sines, will you refer, please, to a statement in one sheet entitled "Lordsburg, New Mexico, [fol. 3479] to El Paso, Texas, Fuel Consumption Comparisons, and Estimated Economies Resulting From Adoption of Long Train Operation?"

A. I have it.

Mr. Mason: May this statement be marked 251, if your Honor please?

The Court: It may be marked.

The Clerk: Defendant's Exhibit No. 251 for identification.

Mr. Mason: Did you prepare this exhibit, Mr. Sines.

A. I did.

Q. I take it that the block "Total Percentage Change for Two Periods" which appears as columns A, B and C, is likewise a reproduction on the first sheet of exhibit 249?

A. That is right.

Q. Now, as to column D, will you explain how the percentage figures in lines 1, 2, and 3 in that column are obtained?

A. Yes. Whereas the previous exhibit 250 dealt with the Tucson division, main and branch lines, this particular exhibit deals with the main line only, Lordsburg, New Mexico to El Paso, Texas, which is a part of the Rio Grande Division, and which I have set aside from the rest of the Rio [fol. 3480] Grande division operations. From our accounting department, I secured figures of car-miles and train-miles in the territory between Lordsburg and El Paso; I modified those figures by the results of our redispatching study as to cars handled and train-miles operated, and determined what the percentage relationship would be between actual performance and redispatched performance.

Q. In number of cars per train?

A. In number of cars per train.

Q. Did you make the same calculation as to gross ton-miles per train-mile?

A. That is right.

The Court: Why weren't the branch lines included in this territory, what I am getting at, Mr. Sines, would this particular exhibit be comparable to the other division territory where branch lines were included if the branch lines were not included in this territory?

A. At best, the branch line operation represents a very small percentage of any division's operation, and has little effect on the ultimate result. The reason that I took the Tucson division in its entirety for the previous exhibit was that the exhibit 249, which is the basis for these fuel computations, had to be made on a division basis including

[fol. 3481] both the main and branch lines, that is the only way those figures are available.

The Court: Now, if that is true in the Tucson division, why isn't it equally true in the Rio Grande division?

A. Now, to the extent that long-train operation has occurred on the Pacific lines and on the Salt Lake division, the improvements that have resulted in operating costs and fuel consumption on the Pacific lines and on the Salt Lake division are kept at a lower level than they would be if you had to consider the main lines only, on a somewhat lower level. I said just a minute ago that the effect of branch-line operations doesn't mean very much anyway. When we come over to the territory between Lordsburg and El Paso, if I modify main-line operation by a percentage which has been determined somewhere else for main and branch, I produce a less economy in the territory between Lordsburg and El Paso, and it results in showing up the long-train operation in a less favorable light than if I were to take the results of main-line operation only. Further than that, there is no particular branch-line operation for the Rio Grande division that I could assign to the territory Lordsburg to El Paso in any kind of a proportion or re-[fol. 3482] lationship.

Mr. Strouss: There is a very substantial difference in the ratio of branch line operations in the two states however, isn't there?

Mr. Mason: Which two states do you have in mind?

Mr. Strouss: I mean the Tucson division and the Rio Grande.

A. I would hesitate to answer that offhand, Mr. Strouss. I am thinking about a long branch line operation we have on the Rio Grande from Tucumcari to Dawson, which exceeds anything you have here in Arizona so far as branch line operations are concerned.

Q. Your forms 521, would they show the relation?

A. Yes.

Q. They show the branch lines on the two divisions?

A. That is right.

Mr. Mason: As to this particular column 19, Mr. Sines, you are considering, as I understand, only that part of the Rio Grande division which is between Lordsburg and El Paso?

A. Yes.

Q. Is that the only portion as to which there was any substantial modification of train lengths as a result of the [fol. 3483] redispatching study?

A. That is right.

Q. Do I understand that the figures in lines 1, 2 and 3 are the changes in that particular district only as a result of the redispatching study?

A. Yes.

Q. Expressed in percentage relationship of actual to redispatch?

A. That is right.

Q. Now, how do you arrive at the figure in line 4, column D; is that by the same process as explained in connection with the corresponding figure on exhibit No. 250?

A. Yes. The ten per cent in column D, exhibit 250, is the result of an increase in locomotive loading of 34.5 per cent, or roughly thirty-five per cent. By means of the relationship between the figure in column D, line 3, and the 35 per cent, I have modified the ten per cent to produce the figure in column D, line 4, of exhibit 251 for identification.

Q. Then the figures shown here in column D, lines 3 and 4, to express your answer in another way, if I may, are substantially in the same proportion as the figures in column [fol. 3484] D, lines 3 and 4, on exhibit 250?

A. Yes.

Q. Going to columns F and G, will you explain whether or not those computations are of the same character as already explained for column D?

A. They are.

Q. Now, as to the lower block of the exhibit, where do you obtain the figures in line 5?

A. As to column H, I secured that figure from the fuel bureau of our accounting department. They furnished me the fuel consumption between Lordsburg and El Paso in fuel oil. They also furnished me the figure in line 8, column H, in tons of coal, because we do have some coal operation of freight trains between Lordsburg and El Paso.

Q. Were the figures in columns J and K secured from the same source?

A. Yes, and I used there twenty-seven thirtieths or nine-tenths of the figures reported for the month.

Q. What about these prices, first of all, the figure in line 6, that is the same figure as presented on exhibit 250?

A. Yes.

Q. And the coal price, where do you get that?

A. Also from our Fuel Bureau of the accounting depart-
[fol. 3485] ment.

Q. Is that the charge-out price of coal as recorded for the particular periods in question?

A. That is right.

Q. Now, I take it that line 11 is simply a total of the money amounts immediately preceding in lines 7 and 8?

A. Yes.

Q. How do you obtain the figures in line 13?

A. The application of the percentages in line 12 to the money amounts in line 11.

Q. Will you say, Mr. Sines, whether or not, generally speaking, No. 251 for identification corresponds in its construction and in the sources used in its preparation to exhibit 250?

A. It does.

Q. It is simply a separate computation because it relates to the line between Lordsburg and El Paso then?

A. Yes.

Mr. Mason: Have you any other questions, Mr. Strouss?

Mr. Strouss: No.

Mr. Mason: Has your Honor any further questions?

The Court: No.

[fol. 3486] Mr. Mason: We offer the exhibit in evidence as Exhibit No. 251.

Mr. Strouss: The same objections.

The Court: The objection is overruled. It may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 251.")

Mr. Mason: Have you before you, Mr. Sines, an exhibit in one sheet entitled "Summary of Annual Savings and Annual Increased Costs in Freight and Passenger Service between Los Angeles, California, and El Paso, Texas," and so forth?

A. Yes, sir.

Mr. Mason: May we have this exhibit marked No. 252 for identification?

The Court: It may be marked.

The Clerk: Defendant's Exhibit No. 252 for identification.

Mr. Mason: Did you prepare Exhibit No. 252, Mr. Sines?

A. I did.

Q. I notice that in the first block of the sheet there is a blank opposite the words "Exhibit Number" following the word "Wages," is that to be filled in?

A. Yes, exhibit No. 229.

[fol. 3487] Q. And again in the next line, "Fuel, Yuma-Lordsburg"; what figure is to be filled in there?

A. 250.

Q. And the next line, "Fuel, Lordsburg-El Paso"?

A. 251.

Q. Are the figures on this exhibit taken directly from other exhibits?

A. They are.

Q. By the way, there is one more blank that I haven't called attention to, line 2, "Passenger Service," exhibit what?

A. 231.

Q. These totals, how are they arrived at?

A. By adding the figures directly above.

Q. Then the figure under freight service identified as a saving for the year, how did you arrive at that?

A. Expanding the figure, total savings for the period in column A by the ratio 17.89 to 100 per cent, which has been developed in previous exhibits, particularly exhibit 229.

Q. Now, on exhibit 226, and I think on 229 as well, you have at the conclusion of the exhibit, it happens to be in line 12 in both exhibits, block 12, expanded a figure for two months to an annual figure by dividing by 17.89?

[fol. 3488] A. Yes.

Q. Have you done the same thing here in this figure which appears in column B of exhibit 252 for identification?

A. Exactly the same.

Q. Now, this figure in line 3, is that the addition of the preceding figures?

A. It is.

Q. And in line 4?

A. It is taken from exhibit 225.

Q. And what does line 5 represent with reference to figures on the exhibit; is it a difference or addition, or what?

A. It is a difference of the figures in lines 3 and 4.

Q. Obtained from subtracting the smaller from the larger?

A. Yes.

The Court: Mr. Sines, this particular exhibit is merely a summary of other figures taken from the exhibits that you have indicated, that are already in evidence?

A. That is right.

Mr. Mason: I take it then, Mr. Sines, the purpose is to bring to one place the figures which may be found in other [fol. 3489] exhibits?

A. Yes, and, as you say there, it occurs to me that you will not find the figure in column A, line 1, wages, on exhibit 229, but you will be able to compute it from the figures on 229. There is an involvement there of the unemployment and pension percentages that the company is paying, which have to be computed separately against trainmen's and enginemen's wages in order to produce the figures shown on Exhibit 252. The data is all available, however, on 229.

Mr. Mason: We offer the exhibit in evidence as Defendant's Exhibit No. 252.

Mr. Strouss: The same objections as heretofore made to exhibits 250 and 251.

The Court: The objection is overruled. It may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 252.")

The Court: We will take our noon recess at this time.

(Thereupon the Court stood at recess until two o'clock P. M. this day.)

[fol. 3490] 2 P. M., February 4, 1941.

All parties being present as heretofore noted, proceedings were resumed as follows:

The Court: You may proceed.

B. S. Sixes resumed the witness stand.

Mr. Mason: Your Honor, Mr. Strouss has asked for the forms 521 for the system and the several divisions for the months and the entire year 1940 and I now have those

documents here. It is quite a bulky set of documents and I will now deliver to Mr. Strouss the 1940 forms 521 I have mentioned; that is, for each division and for the system by months and for the month of December, showing the cumulative totals for the entire year. In addition to that the forms 1232 for the divisions and for the system for the same period are available although not in the courtroom at present and will be made available to Mr. Strouss at the close of the proceedings this afternoon.

Mr. Strouss: Very well.

Mr. Mason:

Q. Had you finished entirely with your explanation of exhibit No. 252, Mr. Sines?

A. Yes.

Q. Have you a statement in one sheet bearing the title, [fol. 3491] "Redispatch Study, June and August, 1938, Extra-territorial Effect of Arizona Train Limit Law between Arizona-New Mexico State Line and El Paso, Texas"?

A. I have.

Mr. Mason: May that be marked No. 253, your Honor?

The Court: It may be marked.

The Clerk: Defendant's exhibit No. 253 for identification.

Mr. Mason:

Q. Mr. Sines, on the face of exhibit No. 253 for identification in the footnote there appears a blank space. Will you state what number should be inserted there?

A. 252.

Mr. Mason: May we have that insertion made on the record copy?

The Court: Yes, it may be made.

Mr. Mason: While we are speaking of insertions, may the record copy of exhibit No. 252 bear the insertions which were recited by the witness in his testimony?

The Court: Yes, exhibit No. 252 may show those insertions.

Mr. Mason:

Q. Will you state the sources from which exhibit No. 253 was prepared, Mr. Sines?

[fol. 3492] A. The figures appearing in section No. 1, columns A and B, come from computations made with respect to the actual and redispatch trains for June and August, 1938, and can be made from working papers which I have in my possession.

Q. Are they taken in the first instance from the actual and redispatch train sheets?

A. Yes.

Q. Dividing the train-miles at the state boundary?

A. That is right.

The Court: Does this cover both freight and passenger or only freight?

A. This refers to freight only.

Mr. Mason:

Q. Now as to line 2, is that taken from the train sheets or the white work sheets A?

A. That is taken from the actual and redispatch train sheets originally and appears in my work papers also.

Q. And column C and column D appear to require no explanation in view of the headlines. Did you perform those operations of subtraction and division which are indicated there?

A. Yes, I performed the operations indicated. I might say that the difference between this exhibit and exhibit No. 226 is that exhibit No. 226 is a recapitulation of all of [fol. 3493] the operations from Yuma to El Paso, whereas on exhibit No. 253 we have simply drawn the line at the state line and have accumulated the train-miles east of the Arizona-New Mexico state line. The processes are the same.

Q. The figures in line 3 are totals except as to the per cent figure in column D?

A. Yes.

Q. How do you arrive at the figure in line 4?

A. By expanding the figure in line 3, column C, by the ratio of 17.89 to 100.

Q. Will you explain a little more fully than the exhibit shows how you arrive at the figure in line 5?

A. The footnote indicates the source of the money which entered into the computation producing the figure with the asterisk. The train-miles in the note are taken from preceding exhibits, the first one being exhibit No. 226. Dividing the money, $329,394, by the train-miles saved, produces the average saving per train-mile. That average saving per train mile is therefore made up of the same elements entering into the total saving of $329,394 and reference to exhibit No. 252 will indicate that those elements are wages and fuel saved plus the passenger service saving [fol. 3494] divided by the total freight train miles saving.

Q. Do you consider the offset of the added facilities?

A. With the deduction of the investment cost for siding extensions and locomotive and caboose investment.

Q. Then is the figure in line 5 a multiplication of the .5158 that you obtained by division?

A. Yes, the figure in line 5 is the multiplication.

Q. I will ask you if this figure of train-miles eliminated at the bottom of exhibit No. 253 is the same figure which appears in column B, block XIII, on exhibit No. 226?

A. Yes.

Q. Have those computations been checked?

A. They have.

Q. Insofar as they are computations, will you say whether or not they are true and correct?

A. They are true and correct.

Q. What is the purpose of exhibit No. 253?

A. To establish the amount of saving which can be effected east of the Arizona-New Mexico state line in a round figure by adoption of the long train program.

Q. Does this purport to be a saving accomplished en- [fol. 3495] tirely outside of the state of Arizona?

A. Yes.

Mr. Mason: Have you any questions, Mr. Strouss?

Mr. Strouss: Yes. Exhibit No. 252 purports to be annual saving between Los Angeles and El Paso. This is between the Arizona-New Mexico line and El Paso. Is that part of the same thing?

A. The saving on No. 253 is included within the saving on No. 252, yes, but I have made that separation or cleavage at the state line by this method of computation.

Mr. Mason: I think what Mr. Strouss has in mind and I think you have answered, although I will ask you the question in another form. Does the total of $329,394 which you show as a net annual saving on exhibit No. 252 include whatever amount might be saved between the state line and El Paso as indicated by exhibit No. 253 for identification?

A. Yes.

Mr. Mason: Has your Honor any questions?

The Court: In the case of exhibit No. 252, that evidently purports to cover both freight and passenger service whereas you have stated that exhibit No. 253 is exclusively freight.

A. The average takes the whole problem into considera-
[fol. 3496] tion and there is involved a couple of thousand dollars over in California also.

Mr. Mason:

Q. You haven't got those two thousand dollars here on exhibit No. 253, have you?

A. No, it is in No. 252.

Q. I think what his Honor has in mind is this, are these train-miles saving in line 4, column C, associated entirely with freight train operation, are those freight train miles or passenger train miles?

A. That figure is freight train solely.

Mr. Mason: Does that answer your Honor's question? We offer the exhibit in evidence as defendant's exhibit No. 253.

Mr. Strouss: The same objection as to the two previous exhibits.

The Court: Objection overruled, it may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 253.")

[fol. 3497] Mr. Mason: Have you a statement before you, Mr. Sines, entitled "Locomotive Repair Cost Data For Use in Redispatch Studies?"

A. I have.

Mr. Mason: May this statement be marked defendant's No. 254 for identification?

The Court: It may be marked.

The Clerk: Defendant's Exhibit No. 254 for identification.

Mr. Mason: Did you prepare this exhibit?

A. I did.

Q. From what sources?

A. From a record regularly maintained by the mechanical department, Form No. 4395-A, the total of which is "Record of Locomotive Mileage Shopping and Repairs."

Q. Is that a record regularly and continuously kept in the office of the general superintendent of motive power?

A. It is.

Q. Are you familiar with the manner in which it is kept?

A. Yes.

Q. In what manner did you prepare this exhibit from that record?

A. Well, I should explain the record a little more in [fol. 3498] detail.

Q. Is the record kept according to types and numbers of locomotives?

A. According to types and individual numbers of locomotives, yes.

Q. And what statistics as to individual types and numbers of locomotives does the record show?

A. Since 1932 this form has shown the expense of making shop repairs and the mileage which those locomotives operate, the mileage being accumulated monthly from records furnished by the auditor of equipment service accounts, the repair expenses being furnished by the auditor of disbursements.

The Court: In column A there, you are referring to types rather than to individual locomotives?

A. That is right.

Mr. Mason: Did the record to which you refer in the motive power department show the mileage prior to 1932 by years?

A. Yes.

Q. And by individual locomotives?

A. Yes, sir.

Q. Did it also show the shop repairs by individual locomotives?

A. It did.

Q. Did it show any other class of repairs?

[fol. 3499] A. It showed the running repairs, they were accumulated prior to 1932.

Q. Have running repairs since 1932 been shown by types or classes of individual locomotives?

A. No.

Q. Do you on this exhibit show running repairs, or do you show the shop repairs only?

A. This exhibit is confined to shop repairs only.

Q. Is there any other classification of the repairs other than the shop repairs or running repairs?

A. Not in connection with form 4395-A, and all of the repairs made to locomotives can be classed either as shop repairs or running repairs.

Q. The two terms are not synonymous then?

A. No; the distinction between the two is that when a locomotive is repaired, if it is out of service more than five days, it is a shop repair, if it is less than five days, it is a running repair.

Q. But the repair in each instance is done in the shop?

A. It can be done in the shop or it can be done in the roundhouse or on the road; as to running repairs, they can be made practically anywhere. Shop repairs have to be [fol. 3500] made in the shop.

Q. But if the repair is of such a nature that it can be completed within five days, then it is a running repair?

A. Yes.

Mr. Mason: And in that case, it would not appear in any figures on exhibit No. 254?

A. No.

Q. Now, having the record in its details as you have indicated, Mr. Sines, how did you go about the preparation of this exhibit; are there any further steps to be explained?

A. Yes. I went to the record and selected the first fifteen locomotives on the list of equipment, in each one of these nominal classifications that had been in service continuously for the ten-year period 1930 to 1939 inclusive. I used that method of selection with all except the F-5 locomotives, and as to those I examined the service record of all of our F-5 locomotives and selected the first fifteen which had not been in mountain service.

Q. By "mountain service" you mean service on the Sacramento Division or the Los Angeles Division between [fol. 3501] Los Angeles and Bakersfield, the San Joaquin Division?

A. That is true as to the Sacramento division from Roseville over the mountain to Sparks, from Roseville north to Eugene over the Cascade Mountains. The F-5 locomotives used between Bakersfield and Los Angeles also see service north of Los Angeles and west of Los Angeles, and it was not possible to exclude them in all instances.

Q. Then, having selected 15 of each of these locomotives, what was your next step?

A. I determined the average weight of the locomotives from records in our mechanical department, and then proceeded to abstract the information in columns C and D from a form that I have previously mentioned, 4395-A, and finally determined the figure in column E by dividing the figures in column D by the figures in column C.

Q. Now, when you speak of the net weight of the locomotive in tons, what weight do you include?

A. That is the light weight without fuel or water.

Q. Does that include only the weight on the drivers?

A. No, that is the entire locomotive and tender.

Q. This figure then will not necessarily agree with the [fol. 3502] figures shown in exhibit 5 or exhibit 6 introduced by Mr. Russell?

A. No, there again we had to select individual locomotives, and the record of their weights and the record of the tender weights and make an average of the combination of locomotive and tender. There is a few hundred pounds' difference as between individual locomotives even of the same type.

Q. Exhibits 5 and 6 purport to show weight on drivers. Is that an entirely different figure from the net weight?

A. Yes, the weight on drivers is always considerably less than the total weight of the locomotive.

The Court: That would be true because the tender weight is not included in weight on drivers?

A. The tender weight, also the weight on engine trucks which are the small wheels at the front of the engine, and the trailer truck, which are the small wheels under the cab of the engine, that weight is not included in weight on drivers.

Mr. Mason: Has the exhibit been compared against its underlying sources, Mr. Sines?

A. Yes, sir.

Q. Have you any or all of the documents from which it [fol. 3503] was prepared available or can they be made available?

A. I have all of the forms 4395-A with me in Tucson, and they can be made available to Mr. Strouss with the exception of the three books which are being used currently to post our record from day to day, which is a continuous operation in the mechanical department, and I left those books in San Francisco with the understanding that they can be sent down here on a moment's notice. The rest of them are here.

Mr. Mason: If you wish them, we can make them available.

Mr. Strouss: I don't think I want them.

Mr. Mason: Will you state whether or not the exhibit is true and correct according to these sources?

A. It is.

Q. And the computations have been checked?

A. They have.

Q. Are they correct, so far as you know?

A. Yes.

Q. Will you state the purpose of the exhibit?

A. The purpose is to establish unit costs for shop repairs for locomotives to be used on subsequent exhibits.

Q. Now, Mr. Sines, have you in your prior exhibits in- [fol. 3504] dicating the potential saving, I am referring particularly to exhibits 252 and 253, made any showing of the increased or reduced expense, whichever the case might be, that would be involved if long-train operation were conducted in place of the restricted operation under the seventy-car law in so far as locomotive repairs are concerned?

A. No.

Q. And they are first treated with, then, I take it, in connection with your exhibit 254?

A. Yes, this is the first place they make their appearance.

The Court: A few moments ago, you mentioned the locomotives used on your mountain divisions. I take it that

the cost of repair is greater on such locomotives than it would be on those operated elsewhere?

A. Yes.

Mr. Mason: Have you made a study of that situation, Mr. Sines, with a view to developing the difference in repair costs as to locomotives predominantly used in mountain service and those used predominantly in valley service?

A. I have.

Mr. Mason: Have you any questions on Exhibit 254, Mr. [fol. 3505] Strouss?

Mr. Strouss: Do I understand column B is an average taken from 15 locomotives of each type?

A. Yes.

Q. Did you obtain the figures under columns C and D; are they averages also?

A. No, they are not averages. They are the total quantities, Mr. Strouss, for the entire fifteen locomotives. The fifteen Moguls in line 1, accumulated the mileage in column C, and there was spent on those fifteen locomotives the money in column D for the ten-year period, 1930 to 1939.

The Court: In other words, those are actual figures?

A. Yes.

Q. Taken from the records of the fifteen locomotives of each type that you selected?

A. Yes.

Mr. Strouss: These are the locomotives from the Pacific Lines as a whole and not from any particular division?

A. Yes, they were chosen from the Pacific Lines as a whole, but I purposely excluded those F-5 locomotives which had operated between Roseville and Sparks, and Roseville and Eugene.

[fol. 3506] Mr. Strouss: It doesn't purport to show shop repairs, for example, on the Tucson division solely?

A. No.

Mr. Mason: Are these types of locomotives which have in the past or are now being used on the Tucson division?

A. Each of those locomotives in lines 2 to 7 are in service today on the Tucson division. I don't know whether we have any of those small ones.

Q. You mean the Moguls?

A. The Moguls.

Q. I think there is a preceding exhibit which shows the Moguls assigned here, but I don't know whether it was the Six to Nine class or whether it was some other class.

A. I am quite sure I would be safe in saying it is representative of all those types that are in service today on the Tucson division.

Mr. Strouss: But it is not limited to the types of locomotives in service on the Tucson division?

A. No; it would be impossible to do that for any great period because these locomotives see service all over our system from time to time and year to year. We transfer [fol. 3507] the power all over.

The Court: Mr. Sines, referring to Mr. Russell's Exhibit No. 5, no reference is made here to the type which you designate here on lines 5 and 6 on exhibit 254 as F-1 and F-5, is there?

A. Yes, the 2-10-2 small is the F-1. Refer to the tabulation on exhibit 5.

The Court: Oh, I see.

The Witness: And the 2-10-2 large is the F-5, or includes the F-5.

The Court: I see. That is clear to me now.

Mr. Mason: Has your Honor any other questions on Exhibit 254?

The Court: No.

Mr. Mason: We offer the exhibit in evidence as Exhibit No. 254.

Mr. Strouss: The same objection.

The Court: The objection is overruled. It may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 254.")

Mr. Mason: Now, Mr. Sines, do you have in addition to the showing on Exhibit No. 254 of these types of locomotives, any statistics as to the mileage, shop repairs and average shop repair costs per mile for the locomotive of the AC-6 class?

[fol. 3508] A. I have. Fifteen locomotives chosen in the manner I have described for the ten-year period from 1930

to 1939 accumulated a mileage of 6,513,481. That figure might now be written at the foot of column C, Exhibit 254; and for the same ten-year period those fifteen locomotives accumulated a shop repair expense of $1,521,554.76. The average weight of an AC-6 locomotive and tender is three hundred and fifty tons. The shop repair cost per mile for these AC-6's, dividing the 1,500,000 by the 6,500,000 miles is 23.36 cents. That figure could be written in column E.

[fol. 3509] Q. What is the character of the service in the territory where these AC-6's, these fifteen, were principally in use during the ten-year period 1930 to 1939?

A. These fifteen AC-6's, in fact all of the AC-6's that are in service, have been in service in mountain territory, Roseville to Sparks and Roseville to Eugene.

Q. Have you an exhibit in one sheet bearing title, "Redispatch Study, Locomotive Repairs, Yuma, Arizona, to El Paso, Texas; for Period April 4th to April 30th, 1940, Actual Operation Compared with Redispatched Operation Observing 70 Car Restriction and Using Present Power and Short Sidings"?

A. I have.

Mr. Mason: May we have that exhibit marked as Exhibit No. 255" for identification?

The Court: It may be marked.

The Clerk: Defendant's exhibit No. 255 for identification.

Mr. Mason:

Q. Did you prepare exhibit No. 255 for identification?

A. I did.

Q. From what sources was it prepared?

A. The figures in columns A and D were taken from the actual and redispatch train sheets and compilations made [fol. 3510] therefrom and the figures in columns B and E come from the previous exhibit No. 254. The figures in columns C and F are results of multiplying the figures in column A by the figures in column B, and the figures in column D by the figures in column E. There are certain types of locomotives appearing on exhibit No. 255 which are not found on exhibit No. 254. I refer to the type in line 5 and in line 4. They are passenger locomotives principally which were used in freight service occasionally in 1940 and which were used in our redispatched operations also for 1940, but for which I did not compute locomotive repairs

according to the method in exhibit No. 254 because there I attempted to confine that study to freight locomotives entirely. It would have been possible for me to compute the locomotive repairs for those two passenger types of locomotives because the figures are available, but because of the fact that the operation is somewhat different any repair expense computed for a passenger locomotive would hardly be applicable if you used that same locomotive in freight service. Therefore, in assigning a unit of repair cost in columns B and E for those two types, I took the repair cost of the next heaviest freight locomotive, the F-1 in [fol. 3511] line 6, and used that.

Q. Is the E-1 referred to in line 6 approximately the same weight over all as the Pacific and Mountain types in lines 4 and 5?

A. It is a little bit heavier than the Mountain type. The Pacific type is the lightest of the three classes.

Q. What effect, if any, results from the use of a unit cost repair figure for a heavier type in connection with these two passenger type locomotives?

A. The effect on the results of this exhibit would not be appreciable because almost the same quantities are involved on the actual and the redispatch operations. In other words, they cancel out except for the difference in column C, line 5, and column F, line 5.

Q. The difference between column C, line 5, and column F, line 5, is apparently less than nine dollars?

A. That is right.

Q. There is no other effect of including these two with these repair rates which you have shown?

A. No.

Q. There are certain computations otherwise on the exhibit than those multiplications. Will you indicate those [fol. 3512] computations?

A. The columns are footed as indicated and the difference between the total in column F and the total in column C appears in line 10 with the total increase for period.

Q. Do you undertake to show by this exhibit No. 255 for identification any item of cost other than the item of shop repairs?

A. That refers to shop repairs only.

Mr. Mason: Have you any questions, Mr. Strouss?

Mr. Strouss: No questions.

Mr. Mason: Has your Honor?

The Court: No questions.

Mr. Mason: We offer the exhibit in evidence as defendant's exhibit No. 255.

Mr. Strouss: The same objection as to the preceding exhibits.

The Court: Objection overruled, it may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 255.")

Mr. Strouss: Mr. Sines, during that period did you have a record of the actual repair costs, do your records show what the actual repairs cost on the Tucson division during that period?

[fol. 3513] A. No, you cannot allocate locomotive repairs to any one division. We have a record for the system, it is the second exhibit from now.

Mr. Strouss: I will wait.

Mr. Mason:

Q. Mr. Sines, I think you stated just before the exhibit was received that this relates only to shop repairs and you have already explained that there are in addition running repairs?

A. That is right.

Q. Is there a system record kept of the total amount of money spent for locomotive repairs, including shop and running repairs?

A. Yes, that goes into our report to the Interstate Commerce Commission, account No. 308.

Q. Is that kept by types?

A. No.

Q. Is there any record presently kept of the total of running repairs by types?

A. No.

Q. Have you made any investigation to determine how much of the total locomotive repair bill during the past several years is included in the totals of shop repairs?

A. Yes.

Mr. Mason: I will defer that question for just a moment. [fol. 3514] I will ask you to turn to an exhibit in one sheet entitled, "Redispatch Study, Summary of Increased Costs, Yuma, Arizona, to El Paso, Texas, for Period April 4th

to April 30th, 1940, Actual Operation Compared with Redispatched Operation Observing 70-Car Restrictions and Using Present Power and Short Sidings"?

A. Yes.

Mr. Mason: May that exhibit be marked "Exhibit No. 256" for identification?

The Clerk: It may be marked.

The Clerk: Defendant's exhibit No. 256 for identification.

Mr. Mason:

Q. Did you prepare this exhibit, Mr. Sines, or cause it to be prepared?

A. I did.

Q. You have certain blanks shown on the exhibit. Will you indicate how those are to be filled?

A. Yes, the first blank should be exhibit No. 236. The next blank opposite "Wages" should have exhibit No. 239 inserted; the third blank opposite "Fuel" should have exhibit No. 250 inserted; the last blank should have exhibit No. 255 inserted.

The Court: Then this exhibit is merely a recompilation of the statistics heretofore admitted in evidence in the exhibits [fol. 3515] you have indicated?

A. That is right.

Mr. Mason:

Q. You simply bring them together in one place and add them for a total, is that the idea, Mr. Sines?

A. Yes.

Q. Is the exhibit true and correct in accordance with the exhibits previously received?

A. It is.

Mr. Mason: Have you any questions, Mr. Strouss?

Mr. Strouss: No questions.

Mr. Mason: Has your Honor?

The Court: No questions.

Mr. Mason: We offer the exhibit in evidence as defendant's exhibit No. 256.

Mr. Strouss: The same objection as to the preceding exhibits.

The Court: Objection overruled, it may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 256.")

Mr. Mason:

Q. Mr. Sines, referring to my discussion of shop repairs and running repairs in their relation to the total, I will ask you to refer to a statement in a single sheet en- [fol. 3516] titled, "Relation between Locomotive Shop Repair Costs, Running Repair Costs, and Total Costs." Have you that statement before you?

A. I have.

Mr. Mason: May this statement be marked "Defendant's exhibit No. 257" for identification?

The Court: It may be marked.

The Clerk: Defendant's exhibit No. 257 for identification.

Mr. Mason:

Q. Did you prepare this exhibit or supervise its preparation?

A. I supervised its preparation.

Q. From what sources was this taken?

A. The total repairs are taken from report to the Interstate Commerce Commission, account No. 308. The shop repairs were secured from the mechanical department which keeps records of the shop repairs in the manner I have previously described in connection with form 4395-A. Having accumulated all the shop repairs, the running repairs are the difference between total repairs and shop repairs.

Q. Then you obtain column B by what process?

A. Deduction or subtraction.

Q. What figures do you subtract?

A. The figures in column A from the figures in column C. [fol. 3517] Q. How do you obtain column D?

A. That is a division of the figures in column A by the figures in column C.

Q. That represents the ratio of A to C, does it?

A. Yes.

Q. How do you obtain the figures in the total block at the foot of the sheet?

A. By dividing the figures in column A by the figures in column C.

Q. I notice there are variations from year to year in the ratios as expressed in column D?

A. That is right.

Q. How are those accounted for?

A. The effect of the economies which were introduced during the depression years when we deferred as much of the heavy work as possible and ran the mileage on the locomotives which were then available and didn't repair them for several months and sometimes even years until the necessity arose for putting them back in service.

The Court: Chickens coming home to roost?

A. That is the reason for the sharp increase between 1933 and 1934.

Mr. Mason:

Q. Are these higher ratios of shop repairs in more recent [fol. 3518] years the performance of those deferred repairs that you spoke of?

A. That and a change in policy with respect to performing shop and running repairs, changes in operations which occur over any ten-year period.

Q. Do I understand that the figure marked "Average" in the right is a straight mathematical average of the figures above or is it a computed figure based upon the three columns preceding?

A. It is a computation based upon the three columns preceding.

Q. What is the purpose of exhibit No. 257?

A. The purpose of exhibit No. 257 is to give a key to the total locomotive repair expense, a part of which has been treated with in connection with exhibit No. 256, No. 255, and No. 254. We could allocate locomotive repairs only as to the shop repair portion of them, but there is in addition to that the cost of running repairs.

Q. Has the exhibit been checked to determine its correctness?

A. Yes.

Q. Have the computations been checked?

A. They have.

Q. Will you say whether or not it is true and correct and in accordance with the underlying sources?

[fol. 3519] A. It is.

Q. Are the annual reports showing the figures in column C either heretofore made available or now available for the use of opposing counsel?

A. Yes, we have them here and they are available at any time.

Mr. Mason: Have you any questions, Mr. Strouss?

Mr. Strouss: No questions.

Mr. Mason: Has your Honor?

The Court: No questions.

Mr. Mason: We offer the exhibit in evidence as defendant's exhibit No. 257.

Mr. Strouss: The same objection as to the preceding exhibits.

The Court: Objection overruled, it may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 257.")

Mr. Mason:

Q. Mr. Sines, will you pass to a statement in a single sheet entitled, "Redispatch Study, Summary of Savings, Yuma, Arizona, to El Paso, Texas, for Period April 4th to April 30th, 1940, Actual Operation Compared with Redispatched Operation, with No Restriction and Using AC Power and Long Sidings"?

[fol. 3520] A. Yes.

Q. I notice that this exhibit has certain blanks. Are those to be filled in?

A. That is right.

Q. What figure should be shown in the first line where it says "Freight service, exhibit No. —"?

A. Exhibit No. 242. In the second blank opposite "Wages" insert the number 245; in the third blank for "Yuma-Lordsburg" insert the figure 250; and in the fourth blank, exhibit No. 251.

Q. Do I understand that this is simply a summary much the same as exhibit No. 256?

A. It is.

Q. And simply brings to one place figures which appear on exhibits already of record?

A. Yes.

Q. Has the addition indicated hereon been checked?

A. It has.

Q. Will you say whether or not the exhibit is true and correct?

A. It is.

Mr. Mason: Your Honor, I overlooked having the exhibit marked. I ask that it be marked as "Exhibit No. 258" and [fol. 3521] subject to any questions of counsel or your Honor that it be received in evidence with that number?

The Court: It may be marked for identification.

The Clerk: Defendant's exhibit No. 258 for identification.

Mr. Strouss: I have no questions but I have the same objections as to the preceding exhibits.

The Court: Objections overruled and it may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 258")

Mr. Mason:

Q. Mr. Sines, I notice that exhibit No. 256 includes an item for locomotive repairs, whereas there is no such item shown on exhibit No. 258. Will you explain that?

A. The AC-8 locomotives which we used in our redispatch with no restriction and long sidings were built in 1939 and have only seen service since the closing months of 1939. They haven't been in service long enough to establish a repair cost which could be used in this case.

Q. Does the AC-8 locomotive resemble any other locomotive now in service?

A. Yes, the AC-8 locomotive is almost an exact duplicate of the AC-6 to which I have previously testified in connec- [fol. 3522] tion with exhibit No. 254 as to design, tractive effort, the only considerable difference being in total weight, which is 376 tons, as compared with the weight of the AC-6 of 350 tons.

Q. Where is that difference in weight principally found in the two locomotives?

A. In the tender.

Q. You spoke of experience with the AC-6's and I think in your testimony indicated a repair rate for shop repairs. Is that repair rate related to the service in which they have principally been assigned?

A. Yes, that is the way it has to be accumulated, from the service that the engine has seen.

Q. You have also stated that you have made a study to determine the difference in the repair rate accumulated by

locomotives in mountain service as contrasted with those in predominately valley service. Just what did your study in that connection consist of?

A. I examined the entire locomotive inventory of the Southern Pacific to find, if I could, a particular type of engine which had had types in operation in mountain territory and in valley territory simultaneously for any con- [fol. 3523] siderable period and I found that I could make a selection of F-5 locomotives that answered that particular need. I found fifteen locomotives which had not operated in the territory between Roseville and Sparks and Roseville and Eugene to any considerable extent during the whole ten years from 1930 to 1939, and then I also found eight locomotives which had spent most of that ten years in that same territory and I found that those that had operated in the less arduous territory accumulated a repair expense 11.56 per cent less than the locomotives——

Mr. Strouss: (Interrupting) I want to object to this as immaterial and incompetent.

The Court: What is the purpose of it, Mr. Mason?

Mr. Mason: Your Honor, it is along the lines as indicated by your question, that is, to develop that the repair rate for locomotives in valley service has been proved by experience to be less than for similar types in mountain service and to develop that the repair rate for AC-6's in valley service or any service other than in these particular arduous mountain districts would similarly be lower if they were used in valley service. They have not been so used according to the testimony of the witness. That would give us [fol. 3524] an index of the repair rate of the AC-8's because the AC-6's and AC-8's are, as the witness has stated and as Mr. McDonald stated when he was on the stand, substantially the same locomotive having precisely the same characteristics.

Mr. Strouss: It would certainly be pretty remote in determining any costs in Arizona where the witness has testified we have no record of locomotive repairs in this division.

The Court: Yes, I will sustain the objection.

Mr. Mason:

Q. Have you some further explanation in connection with exhibit No. 258, Mr. Sines?

A. I wish to point out that the saving of $28,278 which occurred as a result of the redispatch study from April 4th

to April 30th when we redispatched the long trains which had actually been run into still longer trains is to be added to the figure on exhibit No. 256, $9,331, and which indicates the saving that was actually made when we ran long trains, but under the restriction of short sidings and present power, so that adding those two together there is available just from the items considered on those exhibits themselves, $37,500 in savings in the twenty-seven-day period, April 4th to April 30th, 1940.

Q. Does that figure represent the difference between, re-
[fol. 3525] stricted operation on the one hand and operation with AC power and longer sidings on the other?

A. It does.

Q. For those particular items?

A. Yes.

The Court: We will take our afternoon recess at this time.

(Thereupon a short recess was taken, after which proceedings were resumed as follows.)

[fol. 3526] The Court: You may proceed.

Mr. Mason: Mr. Sines, will you take up a statement in a single sheet entitled, "Redispatch Study, April 4th-30th, 1940, Actual Operation Compared With Redispatched Operation, with No Restriction and Using AC Power and Long Sidings, Extraterritorial Effect of Arizona Train Limit Law Between Arizona-New Mexico State Line and El Paso, Texas?"

A. Yes.

Q. Did you prepare the exhibit?

A. Yes.

Q. Will you describe how it was prepared, and from what sources?

A. The mileages in columns A and B were taken originally from the actual and redispatch train sheets, and then from work sheets which I have segregating the train-miles east of the Arizona-New Mexico state line. The train-mile saving, column C, is a substraction, as indicated, of B from A; per cent savings in column D are obtained by dividing the figures in column C by A.

Mr. Mason: By the way, before the witness goes any further, I think I neglected to ask to have this marked. May it be marked Exhibit 259 for identification?

[fol. 3527] The Court: It may be marked.

The Clerk: Defendant's Exhibit No. 259 for identification.

The Court: The blank space in the column below there as to exhibit number, what should that be, Mr. Sines?

A. 258.

The Court: That may be filled in on the original.

Mr. Mason: Now, Mr. Sines, having obtained the figure in line 3, column C, did you go to another exhibit for a multiplier to obtain the figure in column 4?

A. Yes, that came from Exhibit 258, as indicated by the note.

Q. And will you say whether or not the computations on the exhibit are correct?

A. They are.

Q. Has the exhibit been checked against the underlying sources?

A. It has.

Q. Now, I will ask you if this figure in column 4, and the showing on the exhibit in general, is in addition to what is shown on Exhibit 258, or is it a part of what is shown on Exhibit 258?

A. It is a part of the figures on Exhibit 258.

[fol. 3528] Q. And I take it, it is the part which relates to the operation between the Arizona-New Mexico state line and El Paso?

A. Yes.

Mr. Mason: Have you any questions, Mr. Strouss?

Mr. Strouss: No.

Mr. Mason: Has your Honor any questions?

The Court: No.

Mr. Mason: We offer the exhibit in evidence as Defendant's exhibit No. 259.

Mr. Strouss: The same objection as to the preceding exhibits.

The Court: The objection is overruled. It may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 259.")

Mr. Mason: Mr. Sines, does this exhibit resemble a preceding exhibit in which you have presented a summary of extra-territorial effect?

A. Exhibit No. 253, which covered the extra-territorial effect, determined by the redispatching study of June and August, 1938.

Q. Did you undertake to show any extra-territorial effect in so far as the redispatching study of April, 1940, was concerned, using present power and short sidings?

[fol. 3529] A. No.

Q. Then this exhibit resembles only Exhibit 253 in so far as it relates to the extra-territorial effect?

A. That is right.

The Court: In that connection, Mr. Sines, I notice that all of these exhibits which the defendant is offering to illustrate the extra-territorial effect has to do with the territory east of the Arizona-New Mexico line and from there to El Paso?

A. Yes.

Q. And I take it, that by their absence of any exhibits, that the extra-territorial effect west is somewhat inconsequential?

A. West of Yuma?

Q. Yes.

A. Yes, inconsequential.

Mr. Mason: That is in so far as freight service is concerned?

A. Yes.

Q. Have you a showing of extra-territorial effect not measured in money necessarily as to passenger service west of Yuma?

A. Yes, the effect on the passenger service is shown quite clearly——

Q. Isn't that the 33-page exhibit, Mr. Sines, that was [fol. 3530] received some time ago?

A. On the exhibit you mention, which is exhibit No. 199, and also on exhibit No. 232. On Exhibit 232 we develop the extra-territorial effect in money as a result of the redispatching study which we make for the entire year 1938.

Q. As relating to passenger service only?

A. That is right.

Q. I take it, then, that in answer to his Honor's question, as to the inconsequential effect of the law west of Yuma, you had in mind freight-train operations?

A. Yes.

Q. Mr. Siner, what circumstance is there that tends to minimize any extra-territorial effect which the law might have west of Yuma in so far as the Southern Pacific Company is concerned, in connection with freight-train operation?

A. The fact that the freight terminal is located at Yuma, Arizona, immediately adjacent to the state line, which is the middle of the Colorado river.

Q. Do you know and, if so, will you state whether freight trains not conforming to the 70-car restriction operate into and out of Yuma?

A. I know that they do.

Q. Do you know whether or not that operation has been [fol. 3531] substantial and continuous for the past several years?

A. It has.

Q. Now, would it be possible to operate these trains from California or from Arizona into California in length greater than the law permits originating them exactly at the state line or halting them exactly at the state line?

Mr. Strouss: I object to that as immaterial, calling for an opinion based on facts not in evidence.

The Court: Objection sustained.

Mr. Mason: I think the facts are in evidence that the line is in the middle of the Colorado river, and I don't think that it is based on facts not in evidence, and I think the witness is well qualified to state whether such an operation would be possible.

Mr. Strouss: It is not such an operation that has ever been prohibited. The evidence is that that operation is permitted; in other words, that you do operate these long trains in and out of that terminal.

Mr. Mason: Now, do I understand that the counsel for the State will agree that the law does not prohibit the opera- [fol. 3532] tion of trains into and out of the Yuma terminal in length exceeding seventy cars?

The Court: Is that what you are driving at, Mr. Mason?

Mr. Mason: I was driving at this point, that the extra-territorial effect west of Yuma obviously, I think it is obvious, it is to me, is overcome only because the Southern Pacific Company has not been compelled to observe the restrictions of the seventy-car law in bringing its Los

Angeles division trains into Yuma or originating its Los Angeles division trains at Yuma.

The Court: Even though that involved a short-train operation in the State of Arizona?

Mr. Mason: It involved a long-train operation in the state of Arizona. It involves operating trains in excess of seventy cars from the line at the middle of the bridge, as the witness testified, for some distance at least into the state of Arizona. I take it, whether it be one foot, 100 yards or 1000 yards, it is in an operation within the state of Arizona, and it is in defiance of the seventy-car law or by sufferance. Now, which is it, Mr. Strouss?

Mr. Strouss: You can figure it out.

Mr. Mason: Why does the State object to our showing on [fol. 3533] this matter unless the State is prepared to take some stand in this matter?

Mr. Strouss: The witness has testified; I am taking the witness's word for what the past operation has been, that they have operated long-trains in there and used that terminal for long-train operation. Now, if there is any speculative testimony here as to what it would be if there was a different operation in there——

Mr. Mason: That is not what I asked the witness. I asked the witness if it was possible from a practical standpoint to originate these trains at the middle of the bridge or stop them at the middle of the bridge.

The Court: Perhaps it wasn't clear.

Mr. Mason: I will ask you, Mr. Sines, is it possible to originate trains for the Los Angeles division at the middle of the bridge over the Colorado river west of Yuma?

A. No, it is a physical impossibility to have a 125-car train exactly at that state line.

Q. To originate there?

A. Yes.

Q. Is it a physical possibility to make the middle of the bridge over the river west of Yuma an arriving terminal for trains from the Los Angeles division, and by that I mean [fol. 3534] trains not conforming to the seventy-car restriction.

Mr. Strouss: I still don't see the materiality of this.

The Court: I will overrule the objection.

A. No, it wouldn't be physically possible to pull a 125-car train up to the state line, and make any kind of delivery without having a long-train operation in Arizona.

The Court: And, as a matter of fact, all of the tracks that are necessary at a division point are located in the state of Arizona at Yuma?

A. Exactly.

Mr. Booth: A literal and technical compliance with the law would compel us to build a terminal on the California side of the Colorado river, would it not?

A. Yes.

Mr. Strouss: I object to that. That is calling for a conclusion.

Mr. Mason: Can you make up and break up trains without an appropriate trackage upon which to do it?

A. No.

Mr. Strouss: You can run them short to the next terminal, can't you?

[fol. 3535] Mr. Mason: I ask that that statement be carefully recorded, because that is a concession by the State that the law has necessarily extraterritorial effect, you can run short trains into your next terminal into the next state, which compels you to conform to the Arizona law in your New Mexico or California operations.

Q. You heard the statement of counsel, did you, Mr. Sines?

A. Yes, sir.

Q. Do you agree with it?

A. That is one way.

Q. That is one way to meet the requirements of the law?

A. That is the way we have been meeting it east of the Arizona-New Mexico state line for about twenty years.

Q. Now, Mr. Sines, your redispatching study for June and August, 1938, related to those months, in 1938 and to the conditions which prevailed during those months, did it not?

A. Yes.

Q. Will you say whether or not the factors which either governed or permitted operations as they took place in 1938 and as you contemplated them for the purpose of the redis- [fol. 3536] patching study are in general still in existence

and operative upon the territory to which the redispatching study of 1938 relates.

Mr. Strouss: Now, what factors are you talking about? That is a pretty indefinite question. I would like to know what the witness is about to testify to so I can at least have a chance to make an objection.

Mr. Mason: All right, Mr. Strouss. We will particularize them.

Q. Mr. Sines, in 1940 and 1941, is the line in the same place as in 1938?

A. Yes.

Q. Are the sidings the same?

A. Yes.

Q. Is the general character of the traffic substantially the same as in 1938?

A. Yes.

Q. Is the volume of traffic in 1940 and so far in 1941 heavier or lighter than in 1938?

A. The volume is considerably heavier in 1940 and 1941 than it was in 1938.

Q. Then comparing 1938 and 1940 or 1941, would the opportunity for savings such as are indicated by your redispatching study be greater in 1940 than in 1938, or less?

[fol. 3537] Mr. Strouss: That is objected to as calling for a conclusion, speculative.

The Court: The objection is overruled. You may answer.

A. The opportunities would be greater.

Mr. Mason: And why is that?

A. Because the volume of traffic is greater, the number of short trains required to handle that traffic is greater, the opportunities to cut down the train-miles and locomotive-miles are greater.

Mr. Strouss: My objection goes to this.

The Court: Yes.

The Witness: The amount of wages is greater in 1940 than it was in 1938, and the amount of fuel consumed was greater in 1940 than in 1938. All of the elements entering into a cost study of this kind are greater in volume and quantity in 1940 than in 1938.

Mr. Mason: Referring to a comparison of conditions in 1940 and 1938, were the wage levels of the employees whose wages were considered in your 1938 redispatching study the same in 1940 as in 1938?

A. The same.

Q. Were the same general types of locomotives used?

[fol. 3538] A. There has been a change in the assignment on the west end of the Tucson division. We are now using F-4's and 5's more extensively, that is, in 1940 we were using F-4's and 5's more extensively than we were in 1938.

Q. Other than where there has been a change, are the locomotives in use in 1940 and in 1938 all of the F type?

A. Yes, F-1's in 1938 and F-4's and 5's in 1940, although locomotives of both types were used in both years.

Q. Will you refer to other factors which had to do with the redispatch, and state what conditions were the same and what conditions were different, if any?

A. Well, we were operating under the same set-up as to perishable schedules generally, although there has been an advance in the arrival time in Chicago, which was amended just within recent months, which has meant a speeding up in the operation between Yuma and El Paso. That didn't have effect however in April, 1940. We always had the Arizona 70-car law in 1938 as well as in 1940.

Q. That condition has not changed?

[fol. 3539] A. No, and that was the principal item that remained unchanged.

Q. There has been no change in the number of men required or used in crews, has there?

A. No, the Arizona full crew law was operative both years.

Q. There has been no change in the limits of the division?

A. No, that remained the same.

Q. Has there been any change in the location of division terminals?

A. No.

Q. Has there been any change in the location or extent of the helper territories?

A. No.

Mr. Strouss: What about your branch lines?

Mr. Mason: Whether or not there has been any change in branch lines?

Q. Does the branch-line operation have anything to do with the redispatching study?

A. No.

Q. Did it have any effect upon the opportunity of operating long trains upon the main line?

A. None.

Mr. Strouss: Would you mind—I would like to know that for my own information, whether there has been any [fol. 3540] change in the branch lines?

A. Mr. Masson's exhibit, detailing branch-line abandonments will show you what has happened up to recent date.

Mr. Mason: It is my impression there has been very little if any change. There is a history of branch-line abandonment for Arizona in the record.

Q. Mr. Sines, on exhibit 259 and as well upon exhibit 253, you show in a unit cost per train-mile saving in the one case of .596 dollars, or 59.6 cents, and in the other 51.58 cents. I will ask you whether that is relatively high or relatively low as a train-mile cost in your experience?

Mr. Strouss: Relative to what?

Mr. Mason: Well, what is the average cost per train-mile for the group of expenses which you stated and which you have mentioned in your testimony previously as showing the direct cost?

A. For the year 1938 the direct costs on the Tucson division, as shown by the Form 521, per train-mile were $1.285.

Mr. Booth: That is freight train-mile?

A. Yes, freight train-mile.

Mr. Mason: What items of expense does that include?

Mr. Strouss: What year is that?

[fol. 3541] A. That is 1938. That includes fuel, enginemen, trainmen, engine house, other locomotive supplies, train supplies and expenses, and does not include locomotive repairs.

Mr. Strouss: Now, is that main line and branch line both?

A. That is the total for main line and branch.

Mr. Mason: Have you any figure for main line only, cost per freight train-mile?

A. No, that figure has not been compiled since 1932.

Mr. Strouss: May I ask, do you have records showing the costs segregated as to the line through Phoenix?

A. No, we don't have.

Q. Not as to trains run or net tons per train or any of those items?

A. We have statistics, Mr. Strouss, but no costs by statistics.

Q. Operating statistics?

A. Yes.

Q. Segregated as to that particular part of the road?

A. Yes.

Q. I wonder if I could get those statistics?

A. You will find them on form 1232 for the territory [fol. 3542] Wellton to Picacho, or it may be Yuma to Tucson by Phoenix.

Q. That only gives gross ton-miles, locomotive-miles and train-miles.

A. That is right.

Q. But not net tons per train?

A. No. Gross tons per train can be computed and gross tons per locomotive.

Q. But not net tons per train, that is what I was trying to get.

A. No.

Q. You have no statistics on that?

A. We don't have in any of the forms we have furnished you or any of the reports we have published. They may be available in the accounting department work papers, I can't answer as to that.

Mr. Strouss: Pardon me for interrupting.

[fol. 3543] Mr. Mason: You say that you obtained cost exclusive of locomotive repairs for main and branch line freight train miles for 1938 in excess of a dollar, did you, or what was the figure?

A. $1.28½.

Q. Whereas you show here for the year 1938, $0.5158. Does your showing on exhibits Nos. 253 or 259 omit some items which you have stated enter into the direct cost?

A. Yes.

Q. Which ones?

A. Such items as engine house, other locomotive supplies, train supplies and expenses. There are included fuel, enginemen's and trainmen's wages.

Q. Is anything included for repairs on exhibit No. 253?
A. No.
Q. Or No. 259?
A. No.

Mr. Mason: Mr. Strouss, I think we had some discussion off the record as to the appearance of chief dispatcher J. A. Day of Los Angeles division whose testimony, if offered, would have served as a foundation for the passenger redispatch study and the exhibits offered by Mr. Sines relating to the passenger redispatch study, and I think at that time [fol. 3544] you indicated you were willing to agree that he need not be called, that it could be stipulated that the necessary foundation had been laid and Mr. Sines might testify as if his testimony had preceded this.

Mr. Strouss: That is right.

Mr. Mason: His testimony insofar as concerns the redispatching study of the passenger trains during the year 1938 would, I understand, be along the same lines as Mr. Baker and Mr. Herrell and Mr. Cassady?

Mr. Strouss: Yes, I think he only had to do with the passenger redispatching study.

The Witness: That is right.

Mr. Mason: With that understanding he was not called to testify.

Mr. Strouss: That is right.

Mr. Mason: I would like to have that understanding in the record and also express my appreciation of your not having required us to call him. In addition to the forms 521 we now have the forms 1232 that you asked for earlier this afternoon. We have two additional exhibits for Mr. Sines, but they are not quite ready.

The Witness: That is right.

Mr. Mason: I would like at this time to withdraw him [fol. 3545] with the privilege of recalling him the first thing in the morning.

The Witness: That depends on our mail plane connections from San Francisco.

The Court: It will not interfere with your cross-examination of this witness if he is withdrawn?

Mr. Strouss: No.

The Court: Very well, you may step aside, Mr. Sines.

(Witness temporarily excused.)

E. S. FEWTRELL was called as a witness in behalf of the defendant and being first duly sworn testified as follows:

Direct examination.

By Mr. Booth:

Q. Will you state your name and residence to the reporter?

A. E. S. Fewtrell, Berkeley, California.

Q. What position do you hold with the Southern Pacific Company?

A. Chief clerk to the auditor of equipment service accounts.

Q. How long have you occupied that position?

[fol. 3546] A. Fourteen years.

Q. What is the function of the auditor of equipment service accounts office?

A. Records are kept of movement of all cars and locomotives and all operating statistics of train operation are compiled there.

Q. Does the office of the auditor of equipment service accounts use the conductors' wheel reports in accumulating statistics?

A. The wheel reports are one of the basic and most important records that are used there.

Q. Of course you are thoroughly familiar with what they are and how they are used?

A. Yes, sir.

Q. Does your office make up the statistics of freight train miles and freight car miles monthly as a basis for the reports of the company to the various state commissions and to the Interstate Commerce Commission?

A. Yes, some are made weekly.

Q. Will you state the number of freight train miles and freight train car miles, respectively, in the state of Arizona of the Southern Pacific Company for the month of April, 1940?

A. The total made by all trains, train miles, was 237,018; freight train car miles was 13,173,540.

[fol. 3547] Q. Was a special study of the conductors' wheel reports for that month insofar as it related to freight train operation within the state of Arizona made under your direction for the purpose of ascertaining how many trains

of 70 cars and less were run and how many trains of over 70 cars were run in accumulating the 237,018 freight train miles you have mentioned?

A. It was.

Q. That was made of the wheel reports, was it not?

A. Yes.

Mr. Booth: I will state to counsel we have those wheel reports if he cares to examine them.

Mr. Mason: They are a part of the documents used in connection with the April, 1940, redispatch study.

Mr. Strouss: I don't want them.

Mr. Booth: I don't think they would be very much nourishment for anyone.

Q. Will you state the number of freight train miles of trains of 70 cars and less during that month?

A. Freight train miles, 199,761.

Q. How many freight train car miles did those trains of 70 cars and less accumulate?

[fol. 3548] A. 9,993,262.

Q. How many freight train miles were accumulated by trains of over 70 cars?

A. 37,257.

Q. And how many freight train car miles did they accumulate?

A. 3,180,278.

Q. To make the record complete, although it can be done without the witness testifying to it, what is the statistical average of cars per freight train of a train of 70 cars and less obtained by dividing those freight train miles into freight train car miles?

A. 50.03.

Q. And of trains of over 70 cars?

A. 85.36.

Q. And the grand average of all trains?

A. 55.58.

Mr. Booth: No further questions.

Mr. Strouss: No questions.

Mr. Booth: May the witness be excused?

The Court: Yes, he may be excused.

(Witness excused.)

The Court: It is so near the closing hour, if counsel desires to adjourn until morning, we will be at recess until ten o'clock tomorrow morning.

(Thereupon the court stood at recess until 10 A. M., February 5, 1941.)

[fol. 3549] February 5, 1941, ten o'clock A. M.

Proceedings were resumed at this time as follows:

Mr. Booth: If the Court please, at the conclusion of yesterday's session, Mr. Fewtrell was the last witness on the stand, and we find in checking over the work sheets that one figure he gave, namely, the figure at the top of page 3548 of the transcript showing the number of freight car-miles in the trains of seventy cars and less operated during the month of April, 1940, in the state of Arizona was incorrect. I would like to call him to the witness stand to ask him to correct it. It will necessitate a change in three figures that he gave yesterday.

The Court: All right.

E. S. Fewtrell was recalled to the stand, and testified further as follows:

Direct examination (Continued).

By Mr. Booth:

Q. Mr. Fewtrell, on page 3547 of the transcript, at the bottom of the page, I asked you the question, "How many freight train car-miles did those trains of seventy cars and [fol. 3550] less accumulate?" And your answer, line 1, page 3548, was "9,993,262." Now, do you desire to make a correction in that figure?

A. Yes, sir.

Q. Well, what is the correction?

A. The corrected figure is 10,533,262. The average cars per train is 52.73.

Q. And the grand average of cars per train?

A. The freight train car-miles for all trains was 13,713,540. Average cars per train, 57.86.

Q. There was no change in the figures of the trains of over seventy cars?

A. No, sir.

Mr. Booth: I will ask, if the Court please, that the reporter copy this table in the transcript so that we will have it all in one place.

Mr. Strouss: That is perfectly agreeable.

The Court: The reporter may copy it into the record.

(The table referred to reads as follows:)

[fol. 3551] "FREIGHT TRAIN AND FREIGHT TRAIN CAR MILES

STATE OF ARIZONA

April, 1940

	Freight Train Miles	Freight Train Car Miles	Average Cars Per Train
Trains of 70 cars and less	199,761	10,533,262	52.73
Trains of over 70 cars	37,257	3,180,278	85.36
Total	237,018	13,713,540	57.86"

Mr. Booth: We will call Mr. John J. Sullivan.

[fol. 3552] JOHN J. SULLIVAN was called as a witness in behalf of the defendant and being first duly sworn testified as follows:

Direct examination.

By Mr. Booth:

Q. Your name is John J. Sullivan?

A. That is correct.

Q. Your residence is what?

A. San Francisco, California.

Q. What official position do you have with the Southern Pacific Company?

A. I am assistant manager of personnel with headquarters at San Francisco.

Q. What, in a general way, are the duties of the personnel department of which you are assistant manager?

A. The general duties are the matter of employee labor relationships and the negotiation of working agreements with the various crafts, but along with those duties I have been assigned numerous special duties.

Q. When did you first enter the service of the Southern Pacific Company?

A. April 26, 1904.

Q. Will you briefly state the respective services in which [fol. 3553] you have been engaged for the Southern Pacific Company since that time and where they occurred, on what divisions, and for what lengths of time approximately?

A. I originally entered the service on April 26, 1904, as a yard clerk at Lordsburg, New Mexico, then on the Tucson division. Two months later I was transferred to Tucson. Between April 26, 1904, and February 28, 1913, I was employed as a yard clerk at Lordsburg and Tucson, as a clerk and timekeeper, train master's clerk, division accountant, chief clerk to assistant superintendent, chief clerk to the division engineer, and assistant chief clerk to the superintendent of the Tucson division at Tucson. From March 1, 1913, to December 31, 1915, I was a student in general railroad operation on various operating divisions and the general office departments at San Francisco.

Q. Right there, what did the company do in respect to this student course it had at that time?

A. At that time it was the policy to select certain employees, generally graduates of colleges, to train them for subordinate officer positions. Ordinarily the course extended over a period of three and a half or four years and embraced services in the various operating departments, [fol. 3554] for instance, as a student section foreman, student yardman, brakeman, fireman, working in the division shops and general shops with machinists and boiler-makers, in the various statistical departments of the general office including the freight accounts, disbursement accounts, and equipment service accounts; service with various officers; a period in the freight traffic department on the compilation of tariffs and the quotation of rates to the public; service in the general manager's office, in the statistical department, and, finally, as a student assistant train master on one of the operating divisions.

Q. Will you proceed with your duties from January 1, 1916?

A. From January 1, 1916, to July 24, 1917, I was a special inspector and accident and statistical clerk in the office of the vice-president and general manager at San Francisco; from July 25, 1917, to February 28, 1918, I was detailed from the Southern Pacific Company as a general

agent of the American Railway Association, council of national defense, at Camp Cody, Deming, New Mexico.

Q. Having to do with what?

A. The movement of supplies and the concentration of [fol. 3555] troops at Camp Cody. From March 1, 1918, to October 7, 1919, I was in the United States Army as a first lieutenant and captain of engineers, serving in France from June 7, 1918, to September 15, 1919, as assistant superintendent and division superintendent of railway transportation service. October 8, 1919, to February 29, 1920, I was a Southern Pacific Railroad representative on the San Francisco terminal car service committee of the United States Railroad Administration. From March 1, 1920, to July 15, 1920, I was supervisor of transportation of the northern district, which comprised the territory from San Francisco north to Portland and east to Ogden, Utah, with headquarters at San Francisco; from July 16, 1920, to July 22, 1920, I was train master of the Stockton division with headquarters at Tracy, California; from July 23, 1920, to November 30, 1922, I was train master of the Tucson division with headquarters at Yuma, Arizona; from December 1, 1922, to July 31, 1923, I was terminal train master of the Los Angeles terminal; from August 1, 1923, to June 30, 1934, I was train master and assistant superintendent of the Shasta division and the Shasta district of the Sacramento division after consolidation with headquarters at Dunsmuir, California; from July 1, 1934, to [fol. 3556] September 30, 1935, I was special representative of the general manager at San Francisco; from October 1, 1935, to February 28, 1938, I was assistant superintendent of the Salt Lake division with headquarters at Ogden, Utah; from March 1, 1938, to March 31, 1939, I was assistant superintendent of the western division with headquarters at Stockton, California; from April 1, 1939, to October 31, 1939, I was assistant to the general manager with headquarters at San Francisco; on November 1, 1939, I was appointed to my present position, that of assistant manager of personnel.

Q. Now, as accident and statistical clerk in the office of the vice-president and general manager during the period from January 1, 1916, to July 24, 1917, was it a part of your duties to be familiar with the system of reporting railway accidents of various kinds to the Interstate Com-

merce Commission with the classification of those accidents and all matters connected therewith?

A. It was.

Q. In your various capacities as assistant superintendent of the Shasta division and the Salt Lake division, was it a part of your duties to, and did you, familiarize yourself with the same requirements and documents I have mentioned?

[fol. 3557] A. It was my duty.

Q. Have you done any special work, any special assignment, in connection with the preparation and presentation of statistical summaries based either on the published statistical reports of the Interstate Commerce Commission or on the form T's, which we will explain presently, filed with that Commission?

A. I have, I prepared such statistical showings from which I testified in the so-called "first Arizona Train Limit case," the Nevada Train Limit case, and have prepared similar tables for presentation at the trial of this suit.

[fol. 3558] Mr. Booth: Did you on behalf of the Association of American Railroads prepare and present a series of statistical tables bearing on the results of operation of railroads of the United States from the safety standpoint at the hearings before the House Committee on interstate and foreign commerce in the spring of 1938 on Senate Bill No. 69, the so-called Train Limit Bill?

A. I did.

Q. Did you prepare the series of tables, statistical tables bearing on relative safety of operation by years, by districts, and so on, which are referred to in the findings of the Court in the Nevada Train Limit case adopted by the Court in its opinion?

A. I did.

Q. How long have you been engaged in the preparation, in special preparation for testimony in this case?

A. Approximately seven months.

Q. Practically all of your working time?

A. Yes, sir.

Q. You have been here in Tucson since the trial of the case opened?

A. I have.

Mr. Strouss: If the Court please, his testimony as to [fol. 3559] what the Nevada court based its findings on is a conclusion. I move that it be stricken.

Mr. Booth: The figures are referred to in the findings at great length.

The Court: It may be stricken. I don't see that that is material.

Mr. Booth: Have you prepared a photographic copy of seventeen sheets of the rules of the Interstate Commerce Commission governing monthly reports of railway accidents effected January 1, 1922?

A. I have prepared a seventeen-sheet photostatic copy, but it consists of more than the seventeen sheets of the rules of the Interstate Commerce Commission.

Q. Of what does it consist?

A. It is a photostatic copy of the title page and the rules governing the monthly report of railway accidents, commencing at page 11 and continuing to page 36 of the printed rules and regulations of the Interstate Commerce Commission covering the reporting of accidents.

Mr. Booth: We ask that this be marked for identification.

The Court: It may be marked.

The Clerk: Defendant's Exhibit No. 260 for identifica- [fol. 3560] tion.

Mr. Booth: I will state, your Honor, that the entire book from which this is taken is in evidence. It was introduced, I think, as Exhibit No. 9, as a part of exhibit No. 9, but in the interest of brevity in the record, we thought we would take what we considered the material parts and put them in this more convenient form.

Q. Did the Interstate Commerce Commission require reports of railway accidents prior to the adoption of these rules?

A. It did. This particular set of rules is referred to as the 1922 revision.

Q. And took effect when?

A. On January 1, 1922.

Q. Have you access to the copies of all reports made by the Southern Pacific Company under these rules and kept in its offices?

A. I have; those copies that have been retained.

Q. The copies that were retained?

A. Yes, sir.

Mr. Booth: I will offer Defendant's Exhibit No. 260 for identification in evidence.

Mr. Strouss: No objection.

The Court: It may be admitted.

(The document referred to was received in evidence and [fol. 3561] marked "Defendant's Exhibit No. 260.")

Mr. Booth: Will you describe, briefly, for the record the general groups of reportable accidents required by the Interstate Commerce Commission to be reported by railroads under its jurisdiction?

A. On page 14 of the rules, which is sheet 3 of exhibit 260, it will be found that railway accidents are grouped under three classes—train accidents, train service accidents, and non-train accidents. Train accidents cover accidents with or without casualties arising in connection with the operation or movement of trains, locomotives or cars that result in damage to equipment or other railway property in excess of $150, including the cost of clearing the wrecks. Train service accidents cover only fatalities or injuries to persons where damage to the equipment or property does not exceed $150. Train service accidents include all fatalities, and it includes injuries to employees where disability exceeds three days, and injuries to all other persons except employees where the disability exceeds one day. The group of non-train accidents are those that in no way are involved in the operation of trains, cars, or locomotives, and include the group that are found in the operation of shops, [fol. 3562] stations, and other non-train facilities of the railroads.

Q. Now, when you use the word "casualties" in these statistics, you mean both deaths and injuries in the case of an employee resulting in absence from service over three days?

A. That is correct.

Q. In the case of a passenger exceeding one day?

A. That is correct. The term "casualty" includes fatalities as well as reportable injuries.

Q. For the sake of illustration, suppose there is a derailment of train which results in damage to equipment of $100 and in no deaths or personal injuries, that would not be reportable under these rules?

A. That would not be a reportable accident.

Q. If it results in damage to equipment of $150 or more, but no casualties, including deaths, it would be reportable as what?

A. No, the damage must exceed $150, damage of even $150 would not be reportable.

Mr. Booth: Amend the question to read that way.

A. It would be reportable as a train accident.

Q. And if there was a death or casualty resulting from the accident you have just mentioned, it would still be [fol. 3563] reportable as a train accident, would it?

A. That is correct.

Q. Now, let us suppose that in this derailment that resulted in damage of equipment of $150 or less, there was the death of or injury to some person, how would that be reported?

A. That would be reported under the rules as a train service accident.

Q. What about the death of a trespasser?

A. That would be reported as a train service accident. The fatalities or injuries to all persons regardless of their occupation or other relationship is reportable under the rules, the only distinction in the rules being this: An injury to an employee is not reportable unless disability exceeds three days. All other persons except employees are reportable if the disability exceeds one day.

Q. Now, is there anything else to which you desire to call attention in this exhibit No. 260?

The Court: Well, Mr. Sullivan, if there was no damage whatever to any railroad property, but there was an injury to an employee, say, or even a trespasser, that would be listed under train service accidents?

[fol. 3564] A. That is correct. As to the fatalities, I might invite attention to this: A person receiving injury from which death results in less than 24 hours is reported, and required to be reported by the rules of the Commission as a person killed; if the death results subsequently to the expiration of twenty-four hours, under the rules of the Commission the person is reported as one injured and as a subsequent fatality.

Mr. Booth: Does the Commission in its rules break these groups of accidents down into a number of sub-classifications?

A. I does. There is a very extensive sub-division of the causes and sub-causes of both train accidents and train-service accidents.

Q. Is that in the book of rules itself, which has been introduced here as part of exhibit No. 9?

A. It is.

Q. Does the Commission annually publish a statistical report and summary, including its comments of the accidents reported for the preceding calendar year?

A. It does.

Q. You have just handed me accident bulletin 107, summary and analysis of accidents on steam railways in the United States subject to the Interstate Commerce Act, [fol. 3565] Calendar Year 1938. Is that the latest publication of this character which is available?

A. It is.

Q. The Commission has not yet released its annual accident bulletin for 1939?

A. It has not, so far as I know.

Mr. Booth: You are familiar with this, of course, Mr. Strauss?

Mr. Strauss: Yes.

Mr. Booth: I would like to show it to the Court.

Q. Does the Bureau of Safety of the Interstate Commerce Commission itself investigate railroad accidents throughout the United States?

A. It does.

Q. Generally speaking, in what cases does it conduct an investigation?

A. The more serious collisions and derailments, and collisions with motor vehicles where employees or passengers or other persons on the train are killed or receive serious injury.

Q. Almost always the accident is one in which one or more deaths have occurred as a result of the accident; is that correct?

A. Generally that is true, but they don't investigate all [fol. 3566] of them.

Q. Does the Commission issue quarterly summaries of the results of those investigations?

A. It does.

Q. Have you with you available for the inspection of counsel a file of the annual statistical reports of the Inter-

state Commerce Commission similar to report 107 for the year 1923 to the year 1938, inclusive?

A. I have.

Q. You have just handed me a pamphlet entitled "Interstate Commerce Commission, Bureau of Safety, Summary of Accident Investigation Reports, No. 79, January, February and March, 1939." For how long a period have you a file here in Tucson and available to the inspection and use of counsel of these summaries of accident investigation reports?

A. From the year 1927 to the year 1939, inclusive.

[fol. 3567] Mr. Booth: I have just handed his Honor for his inspection and not as an exhibit the quarterly summaries just referred to.

Q. Have you prepared an exhibit, Mr. Sullivan, consisting of six pages giving copies of certain forms filed with the Interstate Commerce Commission and required to be filed with them by railroads?

A. I have.

Mr. Booth: We ask that this be marked for identification as "Defendant's Exhibit No. 261."

The Court: It may be marked.

The Clerk: Defendant's exhibit No. 261 for identification.

Mr. Booth:

Q. What is the first page of this exhibit, Mr. Sullivan?

A. It is an extract from the rules of the Interstate Commerce Commission which appear on pages 22 and 23 of the printed rules, paragraphs 15 to 19, inclusive.

Q. Dealing with what?

A. Dealing with the forms and arrangement of the monthly reports of accidents to the Interstate Commerce Commission.

Q. What is the second page of this exhibit No. 261 for identification?

A. Page 2 is the yellow form identified by the Interstate [fol. 3568] Commerce Commission and on the form itself as form V. The form is the verification of the other forms and is included as a part of the monthly report. It includes, in Section A, report of summary of all non-train casualties to employees on duty that are reportable; also

includes the oath of the authorized officer of the carrier who submits the report to the Interstate Commerce Commission.

Q. What is the third page?

A. The third page is the form T report on which is reported all reportable train and train service accidents.

Q. These form T reports when accumulated at the end of the month are attached to form V and sent to the Interstate Commerce Commission, is that correct?

A. They are arranged in accordance with rules, all of the form T reports covering train accidents being assembled first and immediately following the sheet 1 or the verification report, then followed by all form T's covering the train service accidents and each of these particular groups are further arranged according to the particular group according to the type of train accident or the type of train service accident reported.

[fol. 3569] Q. Do the records of the Southern Pacific Company show since the adoption of the 1923 rules it has followed the mechanics of reporting as you have described them?

A. Yes.

Q. What is the fourth page?

A. The fourth page is the so-called "supplementary form T" covering additional information required in connection with accidents at public highway grade crossings and became effective January 1, 1937, the blank form on page 4 of this exhibit being the 1939 revision, there having been some changes year after year in this particular form.

Q. Prior to 1937, when a train collided with a vehicle at a public grade crossing and a casualty resulted or damage resulted to the train in excess of $150, was that reported to the Interstate Commerce Commission?

A. Yes, it was reported on form T and is still reported on form T. There is no change in the mechanics of reporting that particular type of accident.

Q. There are highway grade crossing statistics in the published reports of the Commission back as far as, we will say, 1923?

[fol. 3570] A. That is correct.

Q. In fact you have used those in making up an exhibit which will be offered later?

A. I have.

Q. What is the fifth page of this exhibit No. 261?

A. The fifth page is known as form R and it is a report required by the Interstate Commerce Commission in connection with any reportable train accident due to a failure of any kind in a rail. In other words, that form is supplementary to any form T that may be made of any train accident that was due to a rail failure.

Q. You spoke a little while ago of subsequent fatalities. Is that form of report covered on page 6 of this exhibit?

A. It is.

Q. Does the Southern Pacific Company retain in its files and have you had access to the filed copies of these reports as they have been filed from time to time since January 1, 1923?

A. I have had access to them at different times during the past years, but the office filed copies of form T reports are not retained permanently or, I should say, indefinitely, but I have had access to certified photostatic copies that were [fol. 3571] obtained from the Interstate Commerce Commission for the years 1923 to 1935, inclusive, and I have the retained office filed copies of the form T reports as far back as 1929, either 1929 or 1930.

Mr. Booth: We offer exhibit No. 261 for identification in evidence.

Mr. Strouss: No objection.

The Court: It may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 261.")

Mr. Booth:

Q. There have been referred to in connection with the testimony of other witnesses the Interstate Commerce Commission statistics on railways in the United States for the years 1923 to 1939, inclusive. Are you familiar with those statistics?

A. I think you mean 1938.

Q. 1938, yes.

A. I am quite familiar with that statistical publication.

Q. Have you prepared a series of exhibits which, for convenience, we will call the "national exhibits" dealing with various phases of casualties on the Class I railroads of the United States from the years 1923 to 1938, inclusive?

[fol. 3572] A. Yes, both casualties and train accidents.

Mr. Booth: I have handed the clerk an exhibit in one sheet entitled "Casualties to All Classes of Employes on Duty Sustained in Train and Train-Service Accidents, Class I Railroads of the United States, Reflected by Statistics of the Interstate Commerce Commission, Years 1923 to 1938, Inclusive," which we ask to have marked "Defendant's Exhibit No. 262" for identification.

The Court: It may be marked.

The Clerk: Defendant's exhibit No. 262 for identification.

Mr. Booth:

Q. From what sources was this exhibit prepared?

A. The information in columns B and C representing total car-miles and total train-miles was obtained from the Statistics of Railways of the United States, the complete reference being shown at the foot of the exhibit. Columns D, E, F, and G appear in the Interstate Commerce Commission Annual Accident Bulletins, the reference being shown at the foot of the page of exhibit No. 262.

Q. Those are all official publications of the Interstate Commerce Commission?

A. They are.

Q. The computed figures in this exhibit were made by [fol. 3573] you?

A. They were. Items 7, 14, 19 to 23, inclusive, are also calculations made by me.

Mr. Strouss: Will you repeat that, please?

A. Items or lines 7, 14, 29 to 23, inclusive, are also calculations made by me.

Mr. Booth:

Q. Is this exhibit true and correct?

A. It is.

Q. Does it not only include employees engaged directly in the operation of trains and locomotives but also includes other employees, injury cases?

A. It does if they receive their injury in train or train-service accidents.

Q. Will you give some illustrations of other employees that it includes?

A. It includes car inspectors and car repairers working around train yards where the movement of trains, loco-

motives, or cars is involved; it includes employees of the maintenance of way department, bridge and building department, signal department working on the track and structures, or that type of employees who may be traveling to and from their headquarters to point of work on track vehicles such as velocipedes, hand cars, motor cars, or similar travel of those employees from one point of work to [fol. 3574] another point of work during their tour of duty where they may have received injury through the operation of locomotives or trains; clerical employees, such as yard clerks out in the yards who are required to take the numbers of cars in trains where they may have received injury by the operation of trains or locomotives or moving cars; it includes the entire group of employees both on and off the train who may receive injury or suffer death through the operation of trains, locomotives, or cars.

Q. It does not include the so-called "nontrain" class of accidents?

A. It does not.

Q. In calculating the rates in the four columns headed "Casualty Rate Per," what bases have you used?

A. In column I, I have used the rate based on a million car-miles which is a recognized measurement of the occurrence of casualties to the movement of a given amount of traffic; in column J, a million train-miles; column K, a million locomotive-miles; column L, a million man-hours, which is a recognized basis of measurement of the occurrence or exposure of employees to injury.

Q. In the case of many employees covered by this ex- [fol. 3575] hibit, there would be no car-miles, train-miles, or locomotive-miles that could be made applicable to them, is that correct?

A. That is partially true. No car-miles or train-miles are accumulated in connection with, for instance, yard or terminal operation, but locomotive-miles are accumulated.

Q. What employees would be included in the computation on the basis of man-hours that would not be included if you had confined the study to locomotive-miles, car-miles, and train-miles, just in general?

A. Generally, any reportable train or train-service accident that might occur in a terminal yard, there would be no train-miles or car-miles against which the occurrence of the casualty could be related; but man-hours are calculated

and maintained for all classes of employees and locomotive-miles are calculated and maintained for yard operations. That was my object in showing the four bases so that the complete picture would be shown based on all of the recognized bases of measuring the occurrence of casualties.

Mr. Booth: Any questions, Mr. Strouss?

Mr. Strouss: Yes. When you said that these columns I, J, K, and L are on recognized bases of calculation, are [fol. 3576] those your own calculations or are those figures taken from the accident bulletins?

A. No, they were calculated by me. The basic figures as to the absolute number of casualties are from the accident bulletins and I calculated the various rates.

Mr. Strouss: That is all the figures in either of those columns?

A. That is true.

Mr. Booth: This can be checked on the face of the exhibit?

A. Yes, they can be checked mathematically and you may find the casualty rates based on man-hours and locomotive-miles in some of the tables of the accident bulletins.

The Court: Then I take it that the Interstate Commerce Commission does not promulgate a casualty rate as you figured it in these columns?

A. Yes, they do, your Honor, they calculate casualty rates based on million man-hours but many of their tables include in that rate the non-train accidents.

The Court: You have made the segregation?

A. I have made the segregation so it would eliminate the non-train accidents and only show the casualty rates for [fol. 3577] train and train-service accidents which are the only type involved in train or locomotive operation. I may state that this is only a series of exhibits prepared in somewhat similar form, and as I shall offer the exhibits they will break down to the various class of employees.

By Mr. Booth:

Q. This is the first of the series?

A. That is correct.

Mr. Booth: If neither counsel nor the Court has any further questions, I will offer the exhibit in evidence.

Mr. Strouss: No further questions.
The Court: It may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 262."

Mr. Booth: I ask that this second national exhibit be marked "Defendant's Exhibit No. 263" for identification.
The Court: It may be marked.
The Clerk: Defendant's exhibit No. 263 for identification.

By Mr. Booth:

Q. Before we pass to it, I would like to ask the witness to describe what this exhibit No. 262 shows in the progressive movement in the average casualty rates on all Class I railroads of the United States from the year 1923 to 1938, [fol. 3578] inclusive?

A. In the first place, I prepared the showing not only as to individual years but in order to show a proper cross-section of cycles of years; I have prepared it so that in addition to the years a comparison may be made with two six-year cycles and a four-year cycle, the first period being from 1923 to 1928; the next period, six years, 1929 to 1934; and the next period being from 1935 to 1938. This will permit not only of a comparison and examination of the trend of casualty rates year by year but it also permits a comparison of a recent consecutive period of years with preceding periods of years. On lines 7, 14, and 19, average casualty rates have been calculated in columns I, J, K, and L. These are not averages of averages, but a calculated average based on the information shown on line or item 7 in columns B, C, D, and E, representing the car-miles, train-miles, locomotive-miles, and man-hours and the casualties reported in column H. With that information shown, it is not difficult to calculate the percentage of decrease in the casualty rates which are shown as lines or items 21, 22, and 23. For instance, on line 21 under column I it will be observed that the casualty rate for the period 1929-1934 [fol. 3579] compared with the earlier six-year period, 1923-1928, has decreased 57.74 per cent. Likewise, the average for the last four years shown compared with the immediately preceding period, 1929-1934, has decreased 27.37 per cent, and on line 23 the casualty rate, or the average casualty rate for the four years, 1935-1938, compared with

the earliest six-year period has decreased 69.39 per cent. In a similar manner, the corresponding decrease may be found in the casualty rate based on train-miles shown in column J, locomotive-miles shown in column K, and on a man-hour basis shown in column L.

[fol. 3580] Mr. Booth: Putting the illustration another way, the average for the four years ending in 1938, which is shown by line 19, column I, would mean that an average of 31.23 casualties occurred in those four years to the movement of one car one hundred million miles or one hundred cars a million miles, is that correct?

A. That is correct.

Q. And those four years an average of 8.77 casualties occurred in the movement of the average train for a million miles?

A. That is correct, that is shown in column J.

Q. And on a man-hour basis that the average casualty rate was 3.18 casualties in one million man-hours?

A. That is correct.

The Court: Mr. Sullivan, how were these casualties reported prior to the year 1923?

A. They were reported in the same manner and on the same basis except that additional subdivisions of the so-called Code Causes were made. In other words, apparently, after the experience of a number of years, the Interstate Commerce Commission decided that there should be further segregation as to specific causes of casualties, both train and train service.

[fol. 3581] The Court: That is when they adopted these 1922 rules?

A. That is true, but I know of my own knowledge that the same type of accident on the same disability basis was reported to the Interstate Commerce Commission in the year 1916 when I was handling that matter in the general manager's office.

The Court: May I ask, will subsequent exhibits cover the period prior to 1922?

The Witness: Prior to 1923?

The Court: 1923, I mean.

A. No, they will not. They all begin at 1923.

Mr. Booth: Would the fact that you have taken four years in the block represented by line 19, and six years in each

of the other blocks represented by lines 7 to 14 in your opinion impair the validity of the comparison between the blocks?

A. No, because you can select any period of consecutive years you want for comparative purposes.

The Court: We will take our morning recess at this time.

(Thereupon a short recess was taken, after which the witness was recalled to the stand, and proceedings were resumed as follows:)

[fol. 3582] The Court: You may proceed.

Mr. Booth: Mr. Sullivan, speaking of the three days' or more disability, more than three-day disability of an employee to make the case a reportable accident, there is another limitation besides that, is there not?

A. Yes, the rules provide that the accident is reportable if the disability in excess of three days occurs within the ten days immediately following the occurrence of the accident. In other words, there must be more than 72 hours' disability within the 240 hours immediately following the occurrence of the accident.

The Court: Mr. Sullivan, is there a time limit within which the individual must die in order to be counted as killed?

A. Yes, the person injured must die within 24 hours after the occurrence of the accident to be counted in the statistics as a person killed. If death occurs after 24 hours the statistics show it as a person injured, but it is reported as a subsequent fatality.

Mr. Booth: Are those both shown on sheet 11 of your exhibit No. 260, those requirements you have just testified to?

A. On sheet 11 of Exhibit 260, which is a reproduction of [fol. 3583] page 30 of the rules at the top, this reference is shown: "Killed. Any person killed in an accident at the time of its occurrence, or so seriously injured as to die within 24 hours thereafter, should be reported as killed. Note: See Section 19 for instructions relative to injuries that subsequently result in death." Section 19 appears on sheet 8 of exhibit No. 260 and is a reproduction of page 23 of the Rules. It states: "Form F (Subsequent fatalities). If, as the result of an injury, a person dies more than 24

hours after the occurrence of the accident, the casualty should be reported on a Form T as an injury, with full details as required by the provisions of the form, and in addition, a memorandum of the death should be given on Form F in accordance with the requirements of that form. This additional report is to be made in connection with the report for the month in which the accident occurred, if practicable; otherwise it should separately accompany the first monthly report filed after the death has come to the knowledge of the carrier. A single Form F may contain reports of more than one such fatality, provided all persons included therein were injured during the same month. A. [fol. 3584] Form F is not required in relation to a non-train accident."

The Court: Well, Mr. Sullivan, assuming that a person was injured in train operations and actually didn't die for two or three years later, but there was a connection between the injury and subsequent death, would you still report it on Form F?

A. Yes, sir, if the death was directly due to the original injury. I have no knowledge of any cases where as much as two years have expired, but I do know of Form F's having been prepared at least a year after the occurrence of the accident.

Q. But the Commission prescribes no time limitation on it?

A. No, sir.

Mr. Booth: The requirement as to the reporting of employees and other persons injured in reportable accidents is shown in the second column on sheet 11 of exhibit No. 260, a reproduction of page 30 of the Rules, is that correct?

A. That is correct.

Q. Now, turning to Exhibit 263 for identification, was this exhibit made from the same sources as Exhibit 262?

A. It was.

Q. And does it show the same information as is shown [fol. 3585] on Exhibit 262, except that it is limited to a smaller number of classes of employees?

A. It is limited to a certain class of employees and there is some limitation in the casualty rate shown on the exhibit.

Q. The limitation is expressed in the title as being "casualties to road trainmen and enginemen on duty; all classes

of service, sustained in train and train-service accidents," is that correct?

A. That is correct.

Q. That would include casualties to road freight, road passenger and work-train service, would it not?

A. That is correct.

Q. What does the term "road train-men and enginemen" include?

A. Road trainmen and enginemen includes conductors, brakemen, flagmen, baggagemen, engineers and firemen.

Q. Engaged in passenger, freight, or work-train service?

A. That is right.

Q. Is there any classification of employees known as a helper which this would include?

A. On some railroads, not very many any more, they [fol. 3586] have what they call a helper to a fireman. If an injury should occur to a fireman's helper, that would be included.

Q. Do we have anything of that sort?

A. Not on our railroad.

Q. Does this include train baggagemen on passenger trains?

A. It does.

Q. Does it include hostlers at terminals taking care of engines, taking them to and from the roundhouse?

A. No.

Q. Now, column D is headed "Man-Hours worked by Road Trainmen." Does that include enginemen as well as trainmen?

A. It does. The Interstate Commerce Commission throughout, where they refer to trainmen, includes conductors and brakemen as well as engineers and firemen. In other words, column D includes all of the man-hours for all of the classes of employees shown in the title of the exhibit.

Q. Or the footnote?

A. Or in the footnote.

Mr. Strauss: What did you mean by "throughout," the Interstate Commerce Commission "throughout" when they say "trainmen"?

[fol. 3587] A. When they refer simply to the term "trainmen," referring to accident bulletin No. 107 for the year 1938, page 107, second column, this reference is made: "The

term trainmen in this bulletin includes engineers and motormen, firemen and helpers, conductors, brakemen and flagmen engaged in passenger, freight, yard, or work-service, also train baggagemen, but not hostlers." A similar reference appears in every accident bulletin from 1923 to 1938 inclusive.

Mr. Booth: Do the same explanations that you gave with respect to the construction and computations in exhibit 262 apply to exhibit 263?

A. Yes.

Q. In other words, it is identical with 262 except for the limited number of employees that it covers as compared with exhibit No. 262?

A. And the bases of measurement, and one basis of measuring the casualty rate.

Q. Are locomotive-miles excluded from 263?

A. It is.

Q. Why?

A. Because all of the classes as shown in the title of the exhibit and the footnote, any casualties may relate either to train-miles or man-hours, the basis of measuring exposure to injury, or car-miles, the measurement of casual- [fol. 3588] ties to the movement of a given amount of traffic, so there was no necessity of showing locomotive-miles in this exhibit, because yard trainmen and yard enginemen are not included in Exhibit 263.

Mr. Booth: Any questions, Mr. Strouss.

Mr. Strouss: No questions.

Mr. Booth: We offer the exhibit as defendant's Exhibit 263.

Mr. Strouss: No objection.

The Court: It may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 263.")

Mr. Booth: Have you any comments on this exhibit other than what you have said about it already and about the preceding exhibit?

A. Nothing except that I would like to direct attention to the trend, to the downward trend of casualty rates as shown in columns H, I and J from 1923 to 1938, and the figures on lines 21, 22, and 23 in the respective columns H, I and J, which shows the percent of decrease in the casualty rates.

comparing the four-year period, 1935-1938, with the average rate in the period immediately preceding it and with the earliest period shown on the exhibit. For instance, line 23 [fol. 3589] shows a decrease in column H of the casualty rate measured on a car-mile basis of 68.03 per cent, comparing the latest period shown with the earliest period shown on the exhibit, and similarly for the column I and column J. You will note that the trend shows a casualty rate of 73.52 casualties per million car-miles in column H for 1923, whereas, in 1938 it was only a fifth of that or 14.57 casualties per million car-miles.

Q. Have you prepared a third exhibit in this national series entitled "Casualties to Road Freight Trainmen and Enginemen on Duty Sustained in Train and Train Service Accidents, Class 1 Railroads of the United States, Reflected by Statistics of the Interstate Commerce Commission, Years 1923 to 1938, Inclusive"?

A. I have.

Mr. Booth: We ask that that be marked Exhibit 264 for Identification.

The Court: It may be so marked.

The Clerk: Defendant's Exhibit No. 264 for identification.

Mr. Booth: Are the sources of this exhibit shown in the footnotes?

A. They are.

Q. Are they the same sources as those from which Ex- [fol. 3590] hibit 263 was prepared?

A. Yes, sir.

Q. And is the exhibit arranged identically in all respects as the arrangement of Exhibit 263?

A. Yes, sir.

Q. What further limitation of classes of trainmen and enginemen on duty is contained in this exhibit 264 for identification?

A. 264 is confined to road freight trainmen and enginemen on duty.

Q. Does that include passenger?

A. It doesn't include passenger.

Q. And work trains?

A. Yes, it includes work trains because road freight trainmen and enginemen man work trains.

Q. Were the computations in this exhibit and the preceding exhibit made by yourself?

A. They were.

Q. I think I neglected to ask you whether all of the others and also whether this exhibit is true and correct, to the best of your knowledge and belief?

A. This and those are.

Q. These exhibits are your personal work, not made by someone else?

A. They are my personal work.

[fol. 3591] Mr. Booth: Any questions, Mr. Strouss, on 264?

Mr. Strouss: No questions.

Mr. Booth: We offer this in evidence.

Mr. Strouss: No objection.

The Court: It may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 264.")

Mr. Booth: Have you any comments to make on this exhibit, Mr. Sullivan?

A. I want to call attention to the downward trend on each of the bases of measurement or the casualty rates shown in H, I and J from the years 1923 to 1938, also the percentage comparisons made and shown on lines 21, 22 and 23 under the respective casualty rate columns. For instance, in column H for the year 1923, the casualty rate applying to road freight trainmen and enginemen on duty was 70.6 casualties per million car-miles, and it had decreased to 13.56 casualties per million car-miles in 1938.

Q. In one hundred million car-miles?

A. A hundred million car-miles.

Q. The decrease by blocks would be from 50.68 in the first six years to 22.01 in the second six years to 16.09, all per one [fol. 3592] hundred million car-miles in the last four years?

A. That is correct.

Q. Is there any statistical advantage of comparing the statistics of this character by blocks rather than by individual years?

A. Yes.

Q. Would it tend to iron out any inequalities of individual years?

A. Yes, because casualties have no regularity in their occurrence, and in order to get a true picture it is necessary

to take a period of three, four, five or six years, and strike an average in order to find a true trend of experience.

Q. Have you prepared another in this series of national exhibits which still further limits the employees covered by the exhibit?

A. Yes.

Mr. Booth: We have handed the clerk one sheet entitled "Casualties to Road Freight Conductors, Brakemen and Flagmen on Duty Sustained in Train and Train Service Accidents, Class 1 Railroads of the United States, Reflected by Statistics of the Interstate Commerce Commission, Years 1923 to 1938, Inclusive." I ask that it be marked Exhibit 265 for identification.

The Court: It may be marked.

The Clerk: Defendant's 265 for identification.

[fol. 3593] Mr. Booth: Are the sources of this exhibit correctly shown in the source notes?

A. They are.

Q. Was this exhibit, like the others, prepared personally by yourself?

A. It was.

Q. Do you believe it is true and correct?

A. Yes, sir.

Q. You made the computations yourself?

A. Yes, sir.

Q. And abstracted the figures from the reports yourself?

A. That is correct.

Q. In what respect and only in what respect does this exhibit differ from the preceding exhibit No. 264?

A. Exhibit No. 265 does not include road enginemen; that is, road engineers or firemen or firemen helpers, if there were any, and it is confined solely to road freight conductors, brakemen, and flagmen, as indicated in the title.

The Court: Just a further breakdown of the previous exhibit?

A. That is correct, your Honor.

Mr. Booth: Have you any questions, Mr. Strouss?

[fol. 3594] Mr. Strouss: No questions.

Mr. Booth: We offer this in evidence as defendant's exhibit No. 265.

Mr. Strouss: No objection.

The Court: It may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 265.")

Mr. Booth:

Q. Have you any comments to make on this, Mr. Sullivan?

A. The same comments apply equally to this exhibit as to the previous one. The casualty rate on the three bases, the downward trend from 1923 to 1938, and the comparisons on the average for the various groups of years as shown on items or lines 21, 22, and 23.

The Court: This exhibit would indicate, would it not, Mr. Sullivan, that your casualty rate on the conductors, brakemen, and flagmen as shown by exhibit No. 265 is slightly less on a percentage basis than where you group larger classifications together? For instance, the previous exhibits Nos. 263 and 264 and also No. 262, down in column H, lines 21 to 23, would indicate that these percentages on this exhibit No. 265 are slightly lower than the other larger groups?

A. The casualty rates become lower in each succeeding [fol. 3595] exhibit because certain classes of employees are eliminated. It does not necessarily mean there is any difference in the casualty rate as applying to a particular group. For instance, if we should go further with exhibit No. 265 and eliminate the brakemen and flagmen, the casualty rate would be lower for the conductors because the casualties in each case are related to the same basic measuring stick; in other words, the same train-miles, the same car-miles. So, finally, if you would only have left one particular group, the casualty rate for that group would be much lower than the total of all employees included in the original group.

The Court: Because your measuring stick is the same for all?

A. That is correct.

Mr. Booth:

Q. The table in all of these exhibits headed "Comparison of Average Casualty Rates" is the table of percentages of decrease and not percentages of rates, is it not?

A. It is a percentage of decrease based on the casualty rates for the respective groups of years.

Q. But not the casualty rates themselves?

A. That is right.

Q. Those casualty rates are shown in the columns pre-
[fol. 3596] ceding?

A. That is right. In other words, from line 1 to 20 in every case that is the casualty rate. Lines 21 to 23 are percentages comparing the casualty rates in the periods with other periods.

Q. Have you prepared a further exhibit headed, "Casualties to Road Freight Conductors, Brakemen and Flagmen, Train-Service Accidents Caused by Sudden Stop, Start, Lurch or Jerk of Locomotive, Car or Train, All Railroads of the United States"?

A. I have.

Mr. Booth: We ask that this — marked "Exhibit No. 266" for identification.

The Court: It may be marked.

The Clerk: Defendant's exhibit No. 266 for identification.

Mr. Booth:

Q. Under the rules of the Commission on the reporting of accidents, will you call attention in the record to the code cause known as "sudden stop, start, lurch or jerk of locomotive, car or train"?

A. In the rules which appear in exhibit No. 9 from pages 37 to 52, inclusive, under the rules governing monthly reports of railway accidents to the Interstate Commerce Commission, the Commission has assigned code of causes for
[fol. 3597] train accidents and train-service accidents. These code causes are used in the annual accident bulletins in preparing their various statistical tables. Under "train-service accidents" on page 51 of the rules, appears Code Cause 7007 which covers casualties resulting from sudden stopping, starting, lurch, or jerk of locomotive, car, or train not elsewhere provided for.

Q. Will you indicate to the reporter what portion of that you have just stated should be included in quotation marks as a quotation from the rules?

A. All that I have just read beginning with "7007" and ending with the word "for" of the phrase "not elsewhere provided for." The following should be quoted, "7008,

sudden application of brakes, improper handling of air." "7009, sudden application of brakes, air hose bursting, parting or otherwise defective." "7010, sudden application of brakes, other defective air brake equipment."

Q. Which of those code causes you have just read into the record are covered by this exhibit No. 266 for identification?

A. 7007, 7008, 7009, and 7010, as shown at the foot of the exhibit.

[fol. 3598] Mr. Booth: Your Honor, we have filed this with the reporter in blueprint form and will ask permission if the exhibit is received to substitute a planograph copy.

The Court: You may have permission to do that.

Mr. Booth:

Q. What classes of employees does this exhibit include?

A. Road freight conductors, brakemen, and flagmen.

Q. On trains of all lengths?

A. Yes, sir.

Q. Is any segregation made by the Interstate Commerce Commission as to trains of different lengths?

A. No segregation is made by the Commission.

Q. I mean in its statistical reports?

A. No, they make no segregation.

Q. That is true of all of its reports on which these tables are based?

A. That is correct.

Q. But the form T reports show, do they not, or should show in each case the length of a frieght train in which an accident occurred which is reported on that report?

A. Yes, the form T carries a space for showing the number of cars in a train.

[fol. 3599] Q. If you have access to the form T reports, you can ascertain the number of cars in the train at the time of the accident as reported by the company?

A. That is right, by reference to item 18-B on form T report.

Q. But you say the Commission itself does not classify trains into lengths at all?

A. It does not in their statistics.

Q. Is that true of passenger as well as freight trains?

A. Yes, sir.

Q. Is there any way from the statistics published by the Interstate Commerce Commission in its annual accident bulletins to determine what proportion of any particular class of train or train-service accidents occurring on road freight trains fell into this arbitrary division of more than 70 cars or 70 cars or less?

A. Will you read that, please?

(The question was read by the reporter.)

A. It is not possible.

Q. Is there any discussion in any of those annual accident bulletins of freight train lengths?

A. I have never seen any.

Q. I am speaking of the annual bulletin, you have read [fol. 3600] all of them, have you not?

A. I have read them all. I have never seen any such reference.

Q. Referring to this exhibit No. 266, columns B and C, which relate to car-miles and train-miles as shown in the headings, are taken from the sources shown in the footnotes?

A. That is correct.

Q. Columns D, E, and F are taken from the sources shown in the footnotes?

A. D and E are; F are additions made by me.

Q. Columns G and H and lines 7, 14, 19, 20, 21, 22, and 23 are calculations made by yourself?

A. That is correct.

Q. And are true and correct to the best of your knowledge and belief?

A. They are.

Mr. Booth: Have you any questions, Mr. Strouss?

Mr. Strouss: The code classification where an accident falls under the code classification is determined from the form T report, isn't that true?

A. Yes, the Interstate Commerce Commission, Bureau of Statistics, based their statistics on an examination of the form T reports submitted by the carriers.

[fol. 3601] Mr. Strouss: And the form T report is based upon the employees' information furnished to officials of the company who prepare the form T report?

A. The information on the form T in most cases is the information furnished by the employee himself, providing it is correct.

Mr. Strouss: What do you mean by that? If an employee who was involved in an accident makes a report, the official making the form T report to the Interstate Commerce Commission reserves the right to determine whether that employee's report was correct?

A. All reports to the Interstate Commerce Commission are made after investigation of the facts because the Interstate Commerce Commission rules require that the management submit the reports under oath and it is their duty under the law and the rules to see that the reports reflect the facts.

Mr. Strouss: As they determine them?

A. Yes.

Mr. Strouss: There are, of course, forms required to be executed and filed by the employee involved in the accident?

A. Yes, the rules require the preparation of accident re-[fol. 3602] ports covering all accidents.

Mr. Strouss: What is that form?

A. It is employee's report of accident, the form blank has been changed over a period of years. If I am not mistaken, it is 2611.

Mr. Strouss: The Code Causes 7007, 7008, 7009, and 7010 are your personal selection of the code classification which cover this particular subject and that no other code classifications do cover it?

A. It is my selection, but I have had the benefit of the assistance and suggestions of the employees who offer statistics of this character. They have felt that these were the controlling causes so it is not altogether my judgment but it is my opinion that these correctly include all of the so-called "sudden stop, start, lurch, or jerk of locomotive or train."

Mr. Booth:

Q. That is in train service?

A. In train-service accidents. As I explained before, these are train-service accidents. There is no comparable code cause prescribed by the Interstate Commerce Commission for train accidents of this type.

Mr. Strouss: That is all.

Mr. Booth: We offer this exhibit in evidence as defendant's exhibit No. 266.

[fol. 3603] Mr. Strouss: I object to it as incompetent, irrelevant, and immaterial, based upon matters not in evidence and upon conclusions and not the best evidence.

The Court: The objection is overruled, it may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 266.")

Mr. Booth:

Q. Have you prepared an exhibit entitled, "Casualties to Passengers on Trains in Train and Train-Service Accidents, Class I Railroads of the United States, Reflected by Statistics of the Interstate Commerce Commission for the Years 1923 to 1938, Inclusive"?

A. I have.

Mr. Booth: We ask that that be marked "Exhibit No. 267" for identification.

The Court: It may be marked.

The Clerk: Defendant's exhibit No. 267 for identification.

The Court: Before you go into that, the Court wants to ask a few questions on exhibit No. 266 in the light of Mr. Strouss' objection. Do I understand, Mr. Sullivan, that this particular exhibit, particularly referring to columns D and E, that you exercised your own judgment in selecting what [fol. 3604] accidents fell into those classifications or were these figures obtained from the reports to the Interstate Commerce Commission?

A. The figures are included in the statistics of the Interstate Commerce Commission under those particular code causes and including only the statistics applying to road freight conductors, brakemen, and flagmen. The exhibit was prepared and introduced in anticipation of the contention that is always made in support of a limitation of freight cars in trains, that the trains of certain lengths, in this case of over 70 cars——

The Court: (Interrupting) I am not so concerned with the purpose of it. My question has to do with the accuracy of the classifications.

A. The figures are correct and are not my selection of any particular figures in these code causes. They are all of the

casualties shown by the Interstate Commerce Commission in their statistics under those particular code causes which they have prescribed and shown for road freight conductors, brakemen, and flagmen.

The Court: What did you mean when you said a moment ago in answer to a question from Mr. Strouss that you had had the benefit and opinion of—did I understand you to say employees?

[fol. 3605] A. I have listened to them testify in these train limit law suits and they offer in support of their contention the casualties occurring under these particular code causes.

The Court: We will cross that bridge when we get to it, but what I am concerned with now is what discretion did you attempt to exercise in the matter of selecting from the various types of accidents to road freight conductors, brakemen, and flagmen the figures shown here in these columns, D and E?

Mr. Strouss: May I interrupt just a minute, one thing that might help the Court, in my asking questions and I think in response to questions from Mr. Booth, you have referred to code causes which I don't think have been explained to the Court.

Mr. Booth: It was explained in the record. Does your Honor have the bulletin before you?

The Court: Yes.

Mr. Booth:

Q. Mr. Sullivan, will you take the Interstate Commerce Commission bulletin for 1938 and refer to the page?

A. On page 58 of the accident bulletin under the title, "Table No. 80, Miscellaneous Train Service Accidents not Elsewhere Classified," will be found certain code causes at [fol. 3606] the extreme left of the page.

The Court: What do you mean by "code causes"?

A. Code causes are code numbers that have been assigned by the Interstate Commerce Commission under their rules and in their statistics for the purpose of showing and classifying and separating the figures which would represent the cause of an injury.

The Court: That is shown on that page 58 by all of those numbers on the left giving the various types of causes of injuries sustained?

A. That is correct. You may go back further, this is a general breakdown of all the casualties. The breakdown of

train-service accidents begins on page 47. This is simply one group.

Mr. Mason: Isn't this the case, if an accident as indicated by the form T is shown to be due to sudden stopping, starting, lurch, or jerk of locomotive, car, or train not elsewhere provided for, it is assigned code number 7007?

A. Yes, but it would be assigned to code 7007 by the Interstate Commerce Commission, not by the carrier.

Mr. Mason: And it is listed or included under the number which appears opposite Code Cause 7007 under table No. 80 [fol. 3607], on pages 58 and 59 of the accident bulletin for 1938 and corresponding tables and pages for earlier issues of the accident bulletin:

A. That is correct.

Q. Similarly, as to 7008, 7009, and 7010?

A. That is right and under the particular class of employees that is shown at the top of the column, and for the purpose of this exhibit under road service, freight conductors in two columns showing the killed and injured, and brakemen and flagmen in the two following columns.

The Court: What I am getting at, might accountants differ in their views as to which one of these particular lines should or should not be included in this exhibit?

A. The title of the exhibit shows the casualties in train-service accidents resulting from sudden stop, start, lurch, or jerk of locomotive, car, or train, and all a statistician or anyone else familiar with this type of statistics need do is to start from the beginning of the train-service accidents code causes and select those that clearly indicate that the casualty was a result of a sudden stop, start, lurch, or jerk, and you will find that 7007 to 7010 include that particular type of accident.

[fol. 3608] The Court: Possibly I would follow you a little easier if you would take the year 1938 for which bulletin No. 107 was issued and substantiate the figures you have shown on this exhibit No. 266 as to that particular line?

A. Exhibit No. 266 are the figures combining Code Causes 7007 to 7010 as indicated at the foot of the exhibit. If the Court will please refer under freight service to conductors and then to column, brakemen and flagmen, if you make an addition of those killed you will find that the total is two. If you add the eight sets of figures, four appearing under conductors and four appearing under brakemen and flag-

men, it will equal the total, 316, shown for 1938 in column E of the exhibit.

The Court: We are now only concerned with conductors and brakemen?

A. In freight service, yes, sir.

The Court: I believe I follow you.

Mr. Mason: In order to make it clear, Mr. Sullivan, all you have done is to aggregate the figures for road freight conductors, brakemen, and flagmen as killed or injured as they appear in those four lines for each of the code causes for those particular years?

A. That is correct.

The Court: We will take our noon recess at this time.

[fol. 3609] February 5, 1941, two o'clock P. M.

The witness, JOHN J. SULLIVAN, was recalled to the stand, and proceedings were resumed as follows:

Mr. Booth: Mr. Sullivan, when we adjourned this morning, Exhibit 267 had been offered for identification. I am wondering whether you had completed your description of the exhibit, passenger exhibit. I think not.

A. I don't think anything was——

Q. Are the sources of this exhibit shown in the source notes at the foot of the exhibit?

A. They are.

Q. And those sources are exclusively official statistics published by the I. C. C. in the volumes there shown in the source notes?

A. For the columns indicated, that is correct.

Q. Column B shows the number of revenue passengers carried by thousands?

A. That is correct?

Q. That is, the first figure would have three ciphers added to it to be approximately correct?

A. That is correct?

Q. And the second figure shows the number of revenue passengers carried one mile by thousands.

A. That is correct?

Q. And those figures to be correct within a thousand [fol. 3610] would have to have three ciphers added to them?

A. That is correct?

Q. Now, the train accidents and train service accidents in columns D, E, F, G, H, and I are taken from the sources shown in the footnotes?

A. Columns D and E and G and H are, and columns F and I are totals made by me.

Q. Those are additions?

A. Yes, sir.

Q. And the columns J, K and L are additions made by yourself?

A. That is correct?

Q. Columns M and N and lines 7, 14, 19, 20, 21 and 22 are computations made by you?

A. That is correct?

Q. They are merely mathematical calculations that can be checked from the face of the exhibit?

A. Yes, sir.

Q. Were the figures shown in the exhibit which were abstracted from the I. C. C. reports correctly abstracted therefrom?

A. Yes, sir.

Q. Are the computations made true and correct, to the best of your knowledge and belief?

A. They are.

[fol. 3611] Mr. Booth: Any questions, Mr. Strouss?

Mr. Strouss: No questions.

Mr. Booth: Your Honor, we offer the exhibit in evidence as Defendant's Exhibit No. 267.

Mr. Strouss: No objection.

The Court: It may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 267.")

Mr. Booth: Now, in respect to the length of time of disability, how do the casualties shown in this exhibit where they did not result in death differ from those shown in the preceding exhibits in so far as they dealt with employees?

A. Well, as indicated in the note at the foot of the exhibit, an injury to a passenger is reportable if the injury is sufficient to incapacitate the injured person from following his

customary vocation or mode of living for a period of more than one day. In the case of employees, the injury is not reportable unless it disables the employee for more than three days within the ten days immediately following the occurrence of the accident.

Q. Under the reporting rules of the Commission, how are deaths to passengers handled in reporting the accident?

[fol. 3612] A. In the same manner as the deaths to any person. If death results within twenty-four hours after the occurrence of the accident, it is reported in the statistics as a person killed. If death results after the expiration of twenty-four hours, it is reported as a person injured and a report made of the subsequent fatality.

Q. You have shown the casualty rates by two methods, per million passengers carried and per hundred million passenger-miles. Have you any observations you desire to make as to that?

A. Yes, million passengers carried represents the absolute number regardless of the distance that the individual passengers may have travelled. In order to give an idea as to the occurrence of accidents and the exposure to injury, generally, casualties are measured against the miles travelled by the passenger which is shown in column C, and the rate is shown in column N. I would like to direct attention to the average casualty rate per passenger carried shown in column M for the four years 1935-1938, which is 4.86 per million passengers carried. That is equivalent to saying that there were less than five passengers killed and injured for every million who travelled. Related to the distance they travelled, the average casualty rate of 10.51 per one [fol. 3613] hundred million passenger-miles, it can be stated in another way, that there was only one casualty for every nine and a half million miles travelled by passengers.

[fol. 3614] Mr. Booth:

Q. The decrease rates, I take it, are self-explanatory?

A. Yes, on lines 20, 21, and 22.

Q. The bottom block contains six percentages of decrease and are not rates per number of passengers or rates per miles traveled?

A. That is correct, except one of the six items is an increase figure, in column M. There are five decreases and one increase, in column M.

The Court: Is there any particular explanation to account for that one increase in that period?

A. There are some factors. It will be noted in 1938, in column D, there was a heavier figure of fatalities in train accidents but, generally, there is not much of a fluctuation and any slight increase is very noticeable on account of the very low casualty rate.

Mr. Booth:

Q. It is only by projecting the occurrence of casualties into the million passengers carried or the hundred million passenger-miles that you get any substantial rate?

A. That is true. Any change in the absolute number affects the average casualty rate when it is related to such a large figure.

The Court: On this classification of train accidents and train-service accidents, you followed the Interstate Com-
[fol. 3615] merce Commission regulations as shown by the exhibits you have already offered on that?

A. That is true, and these figures are taken from the statistics of the Interstate Commerce Commission where they segregate these particular accidents under the group, train accidents and train-service accidents. In fact, the figures in their absolute can be checked by comparing them with Table No. 55. In other words, this is simply a summary for sixteen years of the information reported each year by the Interstate Commerce Commission in Table No. 55.

Mr. Booth:

Q. Have you prepared another of the series of national exhibits entitled, "Casualties in Highway Grade Crossing Accidents in Which Automobiles Were Involved, All Steam Railways, Reflected by Statistics of the Interstate Commerce Commission"?

A. I have.

Mr. Booth: We ask that that be marked "Exhibit No. 268" for identification.

The Court: It may be marked.

The Clerk: Defendant's exhibit No. 268 for identification.

Mr. Booth:

Q. Does this cover the same sixteen-year period as the [fol. 3616] other exhibits?

A. It does.

Q. From what source are the figures derived in this exhibit other than the computations?

A. The source is indicated at the foot of the exhibit, column B from the Statistics of Railways, Interstate Commerce Commission; columns C, D, and E from Interstate Commerce Commission Accident Bulletins, Table No. 13, for the various years; columns F, G, and H, and the figures shown in lines 7, 14, 19, and 20, and the average comparisons in the table at the foot of the exhibit are computations by myself.

Q. For what reason do all of these national exhibits stop with the year 1938?

A. The Interstate Commerce Commission has not as yet distributed the 1939 issue, at least it hasn't been placed in my hands.

Q. Did you make arrangements to have it sent you by air mail as soon as it was issued?

A. Yes, I have an order at Washington to have it transmitted by air mail as soon as it is distributed by the Interstate Commerce Commission.

The Court: Are they customarily two years behind with that?

A. They are later this year than they have been here- [fol. 3617] tofore. They are customarily almost a year behind. Ordinarily, in previous years I have received the bulletin in November or December in the year following that for which it was prepared. In that connection I may state also if we had the accident bulletin showing the number of casualties it would hardly be possible to compute the casualty rates because the blue book, Statistics of Railways, from which I obtain all the other data usually is not distributed until about March or April and the only other source from which the figures could be obtained would be through the preliminary abstracts.

Mr. Booth:

Q. What was the purpose of preparing and offering this exhibit?

A. The occurrence of grade-crossing accidents involving the operation of trains is a very serious problem confronting the public and the railroads as can be readily seen from the columns D and E, where during this sixteen-year period over twenty-six thousand people were killed; even the four-year period from 1935 to 1938 there were 5,875 killed and when it is almost common knowledge that persons injured in automobile accidents receive very severe and serious injury the figure in column E is also quite impressive, where during the same sixteen-year period almost eighty-one [fol. 3618] thousand people were injured or a total of 107,273 were killed and injured for that period. The four latest years shown, 1935 to 1938, shows there were 23,658 persons killed and injured and by referring to column G where the casualty rate has been calculated on a train-mile basis it will be noted that the rate is somewhat constant.

Mr. Strouss: I don't think this exhibit has been admitted, has it?

The Court: No, I think not.

Mr. Booth: Have you any questions on this? I beg your pardon.

Mr. Strouss: No, I have no questions.

Mr. Booth: Any questions, your Honor?

The Court: No.

Mr. Booth: We offer the exhibit in evidence.

Mr. Strouss: I have no objection.

The Court: It may be admitted in evidence.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 268.")

Mr. Booth: I would like to have the witness' explanation stand if there is no objection.

Mr. Strouss: All right.

Mr. Booth:

Q. You spoke of the rate being somewhat constant in column G?

A. Yes, I invited attention to the fact by examining the [fol. 3619] figures in column G that the casualty rate on a train-mile basis shows it has remained somewhat constant. There are slight fluctuations and those fluctuations can more readily be observed by examining the block at the foot of the exhibit in the same column in comparison of average

casualty rates, which shows there is a direct relationship to the operation of trains.

The Court: Taking the year 1938, Mr. Sullivan, it would indicate by reference to the previous exhibit, No. 267, there was considerably less than half the casualties to passengers on trains as what there were casualties to occupants of automobiles at grade crossings during that year?

A. That is correct, the figure in No. 268 shows 5,090 whereas the figure on exhibit No. 267 is 2,335.

The Court: I am wondering why you limited your statistics here in exhibit No. 268 to automobile accidents in grade crossings rather than including all accidents at grade crossings whether it happened to be a pedestrian or a vehicle pulled by horses?

A. Your Honor, this was simply an abstract from a similar table that is prepared by the Interstate Commerce Commission and it is possible from the same table to show [fol. 3620] all casualties regardless of whether they are occupants of automobiles or other vehicles, except that all of the other types is not a very impressive figure. I will say 90 per cent or more accidents occurring at grade crossings involve the occupants of motor vehicles.

The Court: The other is negligible?

A. That is true.

Mr. Booth:

Q. Is it true that you can relate these figures to the number of automobile registrations and there is no way of relating the figures to pedestrians or horse-drawn vehicles?

A. You couldn't relate the casualties to the automobile registrations but they could be related to the million train-miles and possibly I could prepare an exhibit showing that particular study. It would not affect the casualty rate on a train-mile basis very much, but it would increase it because there would be some additional persons included in the total casualties.

Q. Will you refer to the table by number which you just described in your answer to the Court?

A. Table No. 13 in the accident bulletin.

Q. Will you state whether the Interstate Commerce Commission has commented on this subject of its statistics relating to grade crossing accidents in the same bulletin in [fol. 3621] the table was published?

A. Yes, it regularly comments and make observations of the figures reflected by their statistics in the bulletin for the year 1938, Accident Bulletin No. 107, page 11, in the first column.

Q. Will you read that, please?

A. (Reading) "The percentage of reduction in grade-crossing fatalities in 1938 corresponds with that in motor vehicle experience generally. There was a reduction of 19.09 percent in highway grade-crossing fatalities and an estimated reduction of 19.28 percent in motor vehicle deaths.

"Accidents at rail-highway crossings involving motor vehicles were responsible for 4.10 percent of all motor vehicle deaths in 1938.

"There was a decrease in 1938 compared with 1937 of 27.67 percent in the cases where the motor vehicle ran into the side of the train and a reduction of 20.52 percent in the number of cases where the motor vehicle was struck by the train.

"In collision of motor busses and trains, 12 accidents caused 34 fatalities and 73 injuries. School busses were involved in 4 of these accidents which resulted in 28 deaths and 26 injuries.

"In 1938, 53.06 percent of the motor vehicle accidents at [fol. 3622] grade crossings occurred during daylight. The hour of greatest frequency was between 5 and 6 p. m., though it was but slightly higher than in the other hours between 3 and 7 p. m. In a segregation of night accidents according to hour of occurrence, the hour of greatest frequency was between 11 p. m. and 12 midnight. Saturday was the day of greatest frequency. Winter is the season of highest accident frequency at grade crossings. In 1938, 35.58 percent of the total number occurred in November, December, and January, with a peak in December.

"In proportion to the total number of crossing accidents in 1938, the number in which motor trucks were involved declined somewhat under 1937 while those in which passenger automobiles were involved increased slightly in 1938.

"More freight trains were involved in collisions with motor vehicles in 1938 than passenger trains. Freight trains were involved in 45.19 percent, passenger trains in 43.19 percent, and switch and work trains in the remainder. The frequency rate per million locomotive- and motor train-

miles in 1938 was 2.73 for freight trains and 3.24 for passenger trains.

"Out of a total of 1,450 night accidents, 352 or 24.28 per-
[fol. 3623] cent occurred at crossings at which flood, street or other lights had been especially installed to illuminate the crossing.

"Forty-eight percent of all accidents involving motor vehicles occurred at city crossings and 50 percent at rural crossings. Crossings in communities with a population exceeding 2,500 were classed as city crossings.

"Sixty percent of the accidents involving freight trains and motor vehicles occurred at train speeds of less than 20 miles per hour. In 10 percent of the cases, the train was standing. Approximately 34 percent of the accidents involving passenger trains occurred at train speeds ranging from 10 to 29 miles per hour. Seventy-five percent of the accidents involving switching movements occurred at speeds under 10 miles per hour. In 13 percent of these, the train was not in motion."

Q. There is another quotation, I believe, on page 10 of the same bulletin in which the Commission further analyzes these statistics?

A. In the first column at page 10 under the caption, "Highway Grade-Crossing Accidents," it reads:

"Total accidents at public highway grade crossings in
[fol. 3624] 1938 constituted 33.7 percent of the fatalities in all railway accidents and 14.7 percent of all nonfatal injuries. In accidents involving train operation, they accounted for 35.4 percent of all the fatalities and 25.9 percent of the injuries reported by carriers.

"In 1938, 1,517 persons were killed and 4,018 injured in accidents at highway grade crossings. This was a reduction of 358 fatalities and 1,118 injuries under 1937. Automobiles were involved in 88 percent of the accidents at grade crossings in 1938. As may be noted in table 50, 1,198 out of a total of 3,437 accidents that caused casualties at highway grade crossings in 1938 occurred at crossings protected by gates, watchmen, or the various types of signals which indicate the approach of a train. Two thousand, two hundred and thirty-nine accidents occurred at crossings not having the protection described above. Added significance would be given these figures if a record of the proportion of the traffic using these crossings were available.

"As in the case of railway accidents in general, there is a close relation between the number of grade-crossing accidents and volume of traffic. This relation may be noted in [fol. 3625] the table which follows, wherein train-miles are used to express volume of rail traffic, and automobile registration and gasoline consumption to indicate the highway hazard. Although it is recognized that the number of automobiles which pass over railway crossings is not necessarily in proportion to the number registered, it is the best available measure in the absence of an actual count of the number of automobiles that cross railways in a year. As may be observed from table 13, the accident rate whether based on train-miles, automobile registrations, or gasoline consumption is less in 1938 than in the preceding year and in most instances below that shown in the other years covered in the table."

[fol. 3626] Mr. Booth: Just in that connection 1938 was the lowest year; the total number of train-miles as shown by this exhibit, of the four years in the last block, is it not?

A. Yes, it is the lowest since 1933.

Q. Mr. Sullivan, have you prepared another national exhibit in three sheets headed "Train Accidents and Resultant Casualties, All Railroads of the United States, Reflected by Statistics of the Interstate Commerce Commission, Years 1923 to 1938, Inclusive?"

A. I have.

Mr. Booth: We ask that that be marked Exhibit 269 for identification.

The Court: It may be marked.

The Clerk: Defendant's Exhibit No. 269 for identification.

Mr. Booth: Are the sources from which this exhibit was prepared, are all the sources from which this exhibit was prepared shown in the source note on the first page of the exhibit?

A. They are.

Q. Those are the same statistics of railways and the same accident bulletins to which you have been referring?

A. That is correct.

[fol. 3627] Q. You have already defined the meaning of the word "train accidents" within the meaning of the reporting rules of the Commission?

A. Yes, sir.

Q. Into how many classes are those train accidents grouped?

A. Five general classes.

Q. Five general classes, by the Commission itself?

A. Yes, sir.

Q. What are those general classes?

A. Collisions, derailments, locomotive boiler accidents, other locomotive accidents, and miscellaneous train accidents.

Q. Now, what does sheet 1 of the exhibit show in columns, taking up all the columns, what does the first column B show?

A. Column B shows the total car-miles in thousands. Column C shows the total train-miles in thousands.

The Court: This covers both freight and passenger operations?

A. All classes of service, yes, sir.

Mr. Booth: And all railroads in the United States as distinct from all Class 1 railroads?

A. That is right. And column D includes the total lo-
[fol. 3628] comotive-miles in thousands, columns E, F, G, H, and I show the absolute number of each of the different types of accidents as shown by the statistics of the Commission for each of the years 1923 to 1938, the lines 7, 14, and 19 being additions and calculations by myself, as is column J, showing the total of all of the types of train accidents. The statistics not only show the total number of train accidents, but it also shows the number of such train accidents in which casualties occur, and that information is shown in column K of the exhibit, and as to those train accidents in which casualties occur, I have shown in columns L, M and N the casualties to train and engine-men on duty in such accidents.

Q. Those again, with the exception of the additions, are exact copies of the figures in the I. C. C. bulletins from which they were taken?

A. That is correct.

Q. You didn't have enough room on page 1, I take it, to complete this. And what is the explanation as to page 2?

A. Collisions are further subdivided on pages 14 to 16, inclusive, of the rules into nine separate subdivisions, or classes, and the most important of this and the group in

which most of the accidents occur are the rear-end and [fol. 3629] head-on collisions, and these figures representing that particular type of collisions are shown in column B, which is the number of rear-end, and column C the number of head-on, D being simply an addition of the two, and are shown on sheet 2 of this exhibit. Likewise, in columns E and F, the casualties of trainmen and enginemen on duty in rear-end and head-on collisions are shown in their absolute number.

Q. Those figures again are copies of the entries of the I. C. C. reports?

A. That is true as indicated in the source reference at the foot of the exhibit.

Q. Did you complete page 2?

A. Train accidents, as I have stated before, are further separated into groups, which, as to defects or failures of equipment generally involve derailments. The Interstate Commerce Commission in classifying accidents as to defects and or failures of equipment have a number of predetermined groups, one being locomotives and tenders, defects or failures in trucks, defects and failures of wheels and axles, defects and failures in power brakes, which includes the airbrake apparatus, defects and failures of hand-[fol. 3630] brakes, of couplers, of draft rigging, and car bodies, and other parts of the cars, and the figures shown by the Interstate Commerce Commission in their accident bulletins for these various groups have been transferred to this exhibit and shown in columns H to O inclusive, on sheet 2 under the caption "Train Accidents Due to Defects in or Failures of Equipment." In columns Q and R, the figures shown by the Interstate Commerce Commission bulletins cover trainmen and enginemen on duty injured in these accidents has been shown. Column P for the total number of accidents and column S for the total number of casualties are additions by me.

Q. And those are two columns which are related in that exhibit; in other words, the total number of casualties to trainmen and enginemen on duty in the last block on the right applies to column P, does it?

A. Column P. It will be noted that both the number representing the number of accidents and the number representing the casualties appear under the caption headed

"Train Accidents Due to Defects in or Failures of Equipment."

Q. Now, take sheet 3.

A. Sheet 3 is simply the calculations of casualty rates, [fol. 3631] all of which were computations by myself, using the basic figures in columns B, C and D on page 1 of the exhibit, and the other columns as to the absolute number of accidents and the absolute number of casualties shown under the various captions on pages 1 and 2 of the exhibit.

Q. Is this exhibit true and correct, to the best of your knowledge and belief?

A. It is.

Q. It represents your personal work, does it?

A. It does.

Mr. Booth: Any questions, Mr. Strouss?

Mr. Strouss: No.

Mr. Booth: We offer the exhibit in evidence.

Mr. Strouss: No objection.

The Court: It may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 269.")

The Court: Now, Mr. Sullivan, if I understand it, if there was a mere failure of the locomotive or failure of any of the equipment that did not cause an accident, why, then those failures would not be reflected in any way in the statistics shown in this exhibit?

A. If the failure, regardless of its character, caused damage to the equipment or railway property exceeding $150, [fol. 3632] it would be reported as an accident.

Q. Under that, it would not?

A. It would not.

Mr. Booth: Are the percentages of improvement, or decrease, as you term it, shown on this exhibit, and if so, where?

A. It is shown on sheet 3 on items 20, 21, and 22, and according to the index at the extreme bottom of the exhibit. In other words, as was true of other exhibits which have been introduced in this case, they are all decreases, the decrease in the average accident or casualty rate for the indicated group of years is compared with another, and the percentage of decrease of such casualty rates is shown on the appropriate line.

Q. Now, on the first page you show in column J total number of train accidents in these five general groups, in column K you show the total number of those accidents which resulted in casualties. Do you desire to make any observation regarding that?

A. Yes. An impression might prevail that every train accident causes an injury to someone. By comparing the figures shown in column K with the figures shown in column J, it will be observed that only a small percentage of the train accidents that occur result in personal injury.

[fol. 3633] Q. That would be an even smaller percentage than accidents to trainmen and enginemen?

A. Well, somewhat smaller, yes, because this showing includes injuries to all persons, and there have been any number of the 2,084, for instance, shown at the foot of the page, which did not result in injury to trainmen or enginemen on duty.

Q. Well, injuries to trespassers caused by an accident which resulted in damage of more than $150 to equipment, would be in this group?

A. In this particular showing, it would be.

Q. Is there any indication in the report of the Commission, say of 1938, as to what proportion of the total number of injuries were injuries to trespassers and what to trainmen?

A. Well, it cannot be determined from this exhibit, but you can determine the number of accidents to all classes of persons by examining the statistics.

Q. This includes freight trains, passenger trains, work trains, and mixed trains, does it?

A. And yard accidents. It includes all train accidents in all of the groups that are reportable under the rules of the Commission.

[fol. 3634] Mr. Booth: I will pass to another exhibit if there are no questions. Have you prepared an exhibit consisting of 26 sheets entitled "Tabulation of Data Shown in Summaries of Accident Investigation Reports, Interstate Commerce Commission, Bureau of Safety, In So Far as It Relates to Accidents Involving Road Freight Trains, Including Mixed Trains Handling Freight Cars, Years 1928 to 1939?"

A. I have.

Q. Have you with you and available to counsel the quarterly reports of the Interstate Commerce Commission containing the investigations made by the Bureau of Safety of Accidents on the railroads of the United States?

A. I have.

Mr. Booth: I would like to ask to have this marked as Exhibit 270.

The Court: It may be so marked.

The Clerk: Defendant's Exhibit No. 270 for identification.

Mr. Booth: Now, calling your attention to sheet 3 of this exhibit, does that sheet contain a copy of the Act of Congress under which the reports of accidents are required by the Commission and under which it investigates accidents.

[fol. 3635] A. Yes, sir, it is quoted in full in the first two columns on page 3 of the exhibit.

Q. I take it that the underlining there is your work for emphasis, and does not represent an italicised or otherwise conspicuous part of the Act of printing?

A. That is correct, that underlining is my own.

Q. These quarterly reports, a sample of which has already been exhibited and the rest of which you have here, are those the reports made of investigations conducted under section 3 of the Act as shown on page 3 of this proposed exhibit?

A. They are.

Q. Have you personally examined each of those quarterly reports, and each page thereof, for the years 1928 to 1938, inclusive, as the basis for the information abstracted on this report?

A. I have.

Q. And is the information shown on this report exclusively taken from those quarterly reports?

A. It is, as far as the narrative and the information is concerned.

Q. Now, turning to page four of the proposed exhibit, is that typical of the other pages that follow?

[fol. 3636] A. It is.

Q. Column 1 contains a number of four-digit numbers. What do they represent?

A. It is shown for reference, and it represents the investigation number assigned by the Interstate Commerce

Commission Bureau of Safety to their report of the investigation of the specific accident.

The Court: It is merely their docket number?

A. That is right. Each accident investigated is numbered consecutively by the Interstate Commerce Commission Bureau of Safety.

Mr. Booth: And Columns 3 and 4 show what?

A. Shows the persons killed and the persons injured in the accident, as reported by the investigation report.

Q. What does the expression "Number of accidents" mean at the head of Column 2?

A. Simply means that one accident is investigated and it was placed there merely for convenience of tabulating; it could have been omitted.

Q. Do these bulletins show in each case the lengths of the various trains, freight trains involved in the accidents?

A. In every case it shows the full identification of trains; [fol. 3637] and the number of cars that the trains consisted of.

Q. And were you able, from that source and that source alone, to prepare the information contained in columns 5 to 13 inclusive?

A. Yes, sir.

Q. Columns 14 to 17, inclusive, are merely a mathematical calculation from what precedes?

A. That is correct.

Q. Now, taking up the first section of the page, which I will have to identify a little more specifically, it is headed "I"—Roman numeral I, "Negligence of Employes," and following that you have thirty-five descriptions; on this one page you have thirty-five descriptions. Are those descriptions your version of the report of the Commission, or are they taken bodily from the findings of the Commission as to the cause of the accidents?

A. That is the literal language used in the report of the Bureau of Safety in assigning the cause of the accident. No part of the language used by the Commission has been altered by me in any way, and I may state that as to listing these train accidents under the various causes, for instance, Item I, "Negligence of Employes, (A) Train Orders," this conforms to the classification and subdivi- [fol. 3638] sions used by the Interstate Commerce Commission themselves, as shown in the rules, covering the monthly

reports of railway accidents under train accidents, pages 38 to 46, inclusive.

Q. Of the rules governing accidents, which are part of exhibit 9?

A. Yes, sir.

Q. Now, going back to pages 1 and 2 of the proposed exhibit, what are those pages?

A. Pages 1 to 4, tabulations and calculations made by me, based on the information which is summarized following supporting sheets under the various heads. Each accident bulletin indicates the date for which it was rendered, there is an index that shows the number of accidents investigated, the text of the various accident investigation reports indicate the kind of train involved and the character of accident, the persons killed and injured, the length of the train and the cause assigned, and from that information in the bulletin the various blocks, four items to a block for each year, has been transcribed on sheets 1 and 2 for the years 1928 to 1939, inclusive.

Q. Sheet 2, the bottom block of sheet 2, and headed "Causes of Accidents," and so forth, is what?

[fol. 3639] A. Sheet 2 is the summary showing the number of accidents under the general subdivisions used by the Interstate Commerce Commission, negligence of employes, defects in or failures of equipment, defects in or improper maintenance of way structures, and miscellaneous causes, and for those items, in columns 1 to 17 in the lower block has been shown a summary for the entire study covered by the exhibit.

Q. That can be checked mathematically with the succeeding pages?

A. It can.

Q. You took all accidents for the years covered by this exhibit in which a road freight train was involved, including mixed trains handling freight cars?

A. That is correct.

Q. Didn't leave any out?

A. I did not.

Q. And you didn't select any particular type or types of accidents?

A. I did not.

Q. Was there any element of your own personal judgment or opinion involved in arriving at the information shown here as to cause of the accident?

A. None at all. The only part in the preparation where [fol. 3640] my judgment was used was the manner in which it should be reflected.

Q. The mechanical arrangement?

A. The mechanical arrangement of the information.

Q. Can this statement and each and every item on the study of the proposed exhibit 270 be checked with the underlying reports which you have here in the court room?

A. It can.

Q. Are you satisfied that it is true and correct?

A. Yes, sir.

Mr. Booth: Any questions, Mr. Strouss?

Mr. Strouss: No questions.

The Court: Well, Mr. Sullivan, referring to page 2 there, in column 3, that says that the grand total number of all accidents, of accidents of all kinds of trains investigated was 1002. That doesn't necessarily mean that there weren't more than 1002 accidents, but it merely means that 1002 is the number of accidents that the Interstate Commerce Commission investigated.

A. That is true. I know by comparing this figure with the figures shown in the other statistical reports that there [fol. 3641] were other train accidents that the Interstate Commerce Commission Bureau of Safety did not investigate. This simply represents the number that were investigated by the Commission.

Mr. Booth: Will you state to the Court whether during the period covered by this exhibit there was any form of telegraphic report required by the Commission of certain classes of accidents preceding and independent of the submission of the Form T or any other form?

A. Yes, by reference to sheet 3 of the exhibit, at the extreme right or in the third column is copied a copy of the order of the Interstate Commerce Commission issued on December 8, 1928, which requires that carriers report by telegram "any collision or derailment upon the railroad operated by such common carrier resulting in the death or serious injury of one or more persons, including any collision with a motor vehicle at a grade crossing resulting in the death or serious injury of any passenger, employee or other person riding on the train involved in such collision." Invariably the Bureau of Safety investigates any train accident wherein death results to a passenger, and

in many cases where there is serious injury, and they investigate a majority of the train accidents involving [fol. 3642] freight trains where death to persons results, and in some cases where death does not result.

The Court: Well, then it is the major accidents that are investigated, and the minor ones that are not investigated?

A. That is it, the more important accidents with the serious results or questionable cause are investigated by the Interstate Commerce Commission through the medium of their own inspectors.

Mr. Strouss: Mr. Sullivan, I notice at the bottom of page 2, you show the total number of trains, classifying them as to trains of seventy cars and less and trains of over seventy cars, showing then the percentage that were over seventy cars and those under. Now, that percentage, I take it, is the percentage of the accidents?

A. No, the percentage of the number of trains.

Q. Trains in the accidents investigated?

A. Yes, because in one accident there may be two freight trains involved, for instance, a collision.

Q. I mean the trains, that is, the percentage of the number of trains in the accidents investigated?

A. As to lengths, that is correct.

[fol. 3643] Q. Of course, it doesn't in any way show, nor do any records of the I. C. C. show, the related number of short and long trains operated during that period?

A. No, there is no information of that kind available.

Mr. Strouss: That is all.

Mr. Booth: We offer the exhibit in evidence.

Mr. Strouss: I don't see its materiality, but I am not going to object to it.

The Court: It may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 270.")

Mr. Booth: We tender the underlying documents to you for your examination at your convenience.

Mr. Strouss: Yes, I would like to have them.

Mr. Booth: Is there in any of the investigation reports upon which this exhibit was founded any statement or indication in any manner that the length of the train was responsible for any of the accidents investigated?

Mr. Strouss: I object to that.

Mr. Booth: That is the only way I know to prove a negative.

The Court: I will overrule the objection; he may answer Yes or No.

[fol. 3644] A. I have examined and read every report for the period covered by the exhibit, and in no case did the Interstate Commerce Commission state that the accident could have been or might have been avoided, or that the length of the train in any way was involved.

Mr. Booth: May we take our recess now, your Honor?

The Court: Yes, we will take our recess at this time.

(Thereupon a short recess was taken, after which proceedings were resumed as follows:)

[fol. 3645] Mr. Booth:

Q. Mr. Sullivan, just before recess I asked you the following question which was objected to and the objection overruled: Is there in any of the investigation reports upon which this exhibit was founded any statement or indication in any manner that the length of the train was responsible for any of the accidents investigated? And your answer was, "I have examined and read every report for the period covered by the exhibit, and in no case did the Interstate Commerce Commission state that the accident could have been or might have been avoided or that the length of the train in any way was involved."

A. That it might have been avoided if the train had consisted of a lesser number of cars, or any reference that the length of train had anything to do with the accident.

Q. In connection with this exhibit No. 270, taking the block at the bottom of page No. 2, of the freight trains involved in the investigation as covered by this exhibit, how many were 70 cars or less?

A. 574 or 78.8 per cent.

Q. How many over 70 cars?

A. 154 or 21.2 per cent. Of course, you understand that is for the full twelve-year period.

[fol. 3646] Q. Of the total number, how many trains were 40 cars or less?

A. 344 or 47 per cent.

Q. What percentage of these accidents was found by the Commission to have resulted from the negligence of employees?

A. 62.2 per cent.

Q. And from defects in or failures of equipment?

A. 14.1 per cent.

Q. And from defects in or improper maintenance of way and structures?

A. 5.9 per cent.

Q. From miscellaneous causes?

A. 17.8 per cent.

Q. Can those causes be further broken down progressively by years for the use of anything in this exhibit, and, if so, what?

A. Each period covered by the exhibit shown on sheet No. 1 and No. 2, a similar breakdown to the table at the bottom can be made as to the cause of the accident and the proportion of the various train lengths involved.

Q. That is a matter of analysis that I don't think I want to burden the record with at this time. Have you prepared another exhibit similar to the one just admitted as exhibit [fol. 3647] No. 270 and relating to passenger trains for the years 1934 to 1939, inclusive?

A. I have.

Mr. Booth: I hand the reporter an exhibit consisting of thirteen sheets and will ask that the exhibit be marked No. 271 for identification.

The Court: It may be marked.

The Clerk: Defendant's exhibit No. 271 for identification.

Mr. Booth:

Q. Was this exhibit prepared exclusively from the same quarterly reports used in the preparation of exhibit No. 270?

A. It was.

Q. But the period is a lesser period?

A. Yes, sir.

Q. How long did it take you, working time, to prepare this exhibit?

A. About twenty working days. I had already reviewed the reports in the preparation of the other exhibits and

had marked the investigation report references that involved only passenger trains.

Q. To what is this proposed exhibit No. 271 confined?

A. It is confined to all accidents investigated by the [fol. 3648] Bureau of Safety in which passenger trains were involved.

Q. Whether it was one passenger train or two passenger trains?

A. Or a passenger train and a freight train, any accident where the operation of the passenger train was involved in the accident.

Q. And this like the other, No. 270, covers all railroads in the United States or only Class I railroads?

A. It covers any accident investigated by the Bureau of Safety and they have jurisdiction over all railroads.

Q. Are the statements "Causes of Accidents" subject to the same explanation exactly as the explanation you gave of those statements in exhibit No. 270?

A. Exactly the same.

Q. No element of personal judgment or choice of words on your part?

A. No, sir.

Q. Nothing was resorted to in the preparation of this exhibit except the quarterly reports for the years 1934 to 1939, inclusive?

A. That is correct. There is some difference in the summary of causes of accidents investigated between the [fol. 3649] exhibit No. 271 for identification and exhibit No. 270 in that I have made a segregation of the accidents classified as "Collisions with Vehicles at Grade Crossings" on account of there being such a large percentage involved and that is an additional cause that has been separated from the miscellaneous.

Q. In exhibit No. 270 that was embraced in the miscellaneous causes?

A. Yes, because there was not a very large number of freight train accidents involving automobiles or grade crossing accidents investigated by the Commission.

Q. Are the computations made in this exhibit true and correct?

A. Yes, sir.

Q. And the result of your own personal work?

A. Yes, sir.

Q. Is the exhibit itself true and correct to the best of your belief?

A. It is.

Q. And the same accident bulletins for the years 1934 to 1939, inclusive, that in part underlie exhibit No. 270 underlie this?

A. Not the accident bulletins but the quarterly summaries.

[fol. 3650] Mr. Booth: I mean the quarterly summaries. Any questions, Mr. Strouss?

Mr. Strouss: No questions.

Mr. Booth: Your Honor?

The Court: No.

Mr. Booth: We offer this in evidence as defendant's exhibit No. 271.

Mr. Strouss: No objection.

The Court: It may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 271.")

Mr. Booth:

Q. How many occurrences were investigated which went into this table?

A. Involving passenger trains, a total of 232 accidents out of a total of 520 of all accidents investigated.

Q. What percentage of those did you find due to negligence of employees?

A. 48.3 per cent, that is, negligence of employees as described by the Interstate Commerce Commission, Bureau of Safety.

Q. What were found by the Bureau of Safety to be due to defects in or failure of equipment?

A. 3 per cent.

Q. To defects in or improper maintenance of way?

[fol. 3651] A. 9.1 per cent.

Q. To collisions with vehicles at grade crossings.

A. 18.1 per cent.

Q. And to miscellaneous?

A. 21.5 per cent.

Q. Was the length of the passenger train, or the trains if there was more than one, stated in each case in the report which formed the basis of this tabulation?

A. Yes, it was.

Q. You have tabulated here the number of trains of 14 cars or less and their percentage and the number over 14 cars and their percentage. Will you give those figures, please?

A. Of the total number of trains involved, which was 267, of the 232 accidents investigated for the six years, 261 trains consisted of 14 cars and less or 97.8 per cent and 6 trains consisted of over 14 cars or 2.2 per cent.

Q. Are the details of the accidents involving those six trains shown in the first sheet?

A. Yes, I have briefly narrated the character of the accidents for the six trains consisting of more than 14 cars, but the detail of the cause and the other data as given [fol. 3652] by the Interstate Commerce Commission may be found on the appropriate page opposite the Interstate Commerce Commission investigation number that I have shown opposite the item on sheet No. 1.

Q. These six statements under the heading, "Brief Description," on page No. 1 are simply literal transcripts of what appeared by the same investigation number in the following pages, is that correct?

A. Yes, except more information is included in a sentence, where on the following pages it is tabulated.

Mr. Strouss: May I ask a question. An accident investigated by the Commission which involved a freight train fouling on passenger tracks derailing a passenger train, would that be included in this?

A. Yes, it would, if the passenger train was derailed, it would be in there.

Mr. Strouss: Under what heading would that appear?

A. It would depend upon the cause. If it was employee negligence, it would likely be on page 4, "Failure to identify opposing trains or to clear superior trains," or it might be under item 5, "Overrunning scheduled meeting point or [fol. 3653] failure to clear switch at meeting or passing points." It would depend upon the cause assigned by the Bureau of Safety of the Interstate Commerce Commission as to where it might be shown.

Mr. Strouss: Thank you.

Mr. Booth:

Q. Is there any accident that occurred in Arizona shown on this exhibit?

A. Yes.

Q. Where?

A. On sheet No. 11, item 30, opposite investigation 2371, was an Arizona accident.

Q. Has the Commission during this period investigated any other accidents to passenger trains and placed the results of its investigations in its quarterly bulletins than those shown in this exhibit? In other words, have you included in the exhibit all passenger trains investigated by the Bureau of Safety during the period covered by the exhibit?

A. They are all included for the years 1934 to 1939, inclusive.

The Court: Was this Arizona accident shown on sheet No. 11 on the Southern Pacific lines or on the Santa Fe?

A. It was on the Santa Fe.

Mr. Booth:

Q. There were 232 occurrences investigated or what you [fol. 3654] call "accidents," were there?

A. Involving passenger trains, that is correct.

Q. And those involved a larger number of passenger trains than 232, did they not? In other words, in some of those occurrences there was more than one passenger train?

A. Of the 232 occurrences, it involved a total of 261 passenger trains.

Q. In any of these investigations, did the Interstate Commerce Commission state or in any way intimate or did the Bureau of Safety of the Interstate Commerce Commission intimate in any way that the length of the passenger train in any way contributed to the accident?

Mr. Strouss: Again I make my objection, that is irrelevant and incompetent.

The Court: Objection overruled.

A. No.

Mr. Booth:

Q. Have you, independent of this exhibit, in the courtroom with you investigation report No. 1718 of the Interstate Commerce Commission related to the derailment of passenger train at Dome, Arizona, on August 5, 1931? Do you have that report with you?

A. Yes, that is in quarterly report No. 49 for the period [fol. 3655] July to September, 1931.

Q. Referring solely to that report, what were the circumstances of that accident as found by the Bureau of Safety?

Mr. Strouss: If he is asking the witness to give his conclusions, I object to that.

Mr. Booth: This was an extra train of about three cars. We have the train sheets here and the train sheets will show that the Arizona law made it necessary to run this train. It was run on ahead and was a very light train, and if was wrecked and the men were killed directly chargeable to the law is our contention.

Mr. Strouss: If they want to put the whole report in, that is all right.

The Court: You mean the particular docket number 2371?

Mr. Booth: We will have the report copied and put that in. I will defer this until then.

Mr. Mason: I think the record should be clear here; we were not talking about the Coconino accident on the Santa Fe, that is 2371. We were talking about an accident which is not on exhibit No. 271. It occurred prior to the period studied by that exhibit.

Mr. Strouss: It occurred in 1931, didn't I understand [fol. 3656] you to say?

The Court: There were two accidents, Mr. Strouss, the Santa Fe accident and the accident occurring in 1931. The one Mr. Booth was interrogating about occurred in August, 1931, on the Southern Pacific.

Mr. Booth: The one I referred to is investigation report 1718, an accident occurring on August 5, 1931, which is not shown on this exhibit at all and which occurred on the Southern Pacific near Dome, Arizona.

Mr. Mason: The Coconino accident is referred to particularly on sheet No. 13 of exhibit No. 271 as having occurred on the Santa Fe on July 27, 1939.

Mr. Booth:

Q. Have you prepared an exhibit headed, "Casualties to All Classes of Employes on Duty, All Classes of Service, Sustained in Train and Train Service Accidents, Reflected by Statistics of the Interstate Commerce Commission,

Years 1923-1938, Inclusive," for the Southern Pacific Company (Pacific Lines)?

A. I have.

Mr. Booth: We ask that that be marked "Exhibit No. 272" for identification.

The Court: It may be marked.

[fol. 3657] The Clerk: Defendant's exhibit No. 272 for identification.

Mr. Booth:

Q. From what source or sources was this exhibit prepared?

A. From the Interstate Commerce Commission Annual Accident Bulletins.

The Court: Do I understand you have completed your showing on the national picture and are starting now on the accident reports of the Southern Pacific Company?

Mr. Booth: I think we have unless there is some exhibit that hasn't reached here yet. Is that correct, Mr. Sullivan, are there any other national exhibits?

A. I think it is complete.

Mr. Booth:

Q. What does column B show on this exhibit No. 272 for identification?

A. It shows the total locomotive-miles in thousands as shown in the annual accident bulletins of the Interstate Commerce Commission.

Q. And columns C and D?

A. The killed and injured as shown in the accident bulletins for each of the years.

Q. And columns E and F are merely mathematical calculations from the preceding columns, are they?

A. That is correct.

[fol. 3658] Q. Lines 7, 14, 19, 20, 21 and 22 are your computations, are they?

A. They are.

Q. And the three bottom lines, 20, 21, and 22, show the decreases as described in those lines?

A. Except one item; 21 is an increase.

Q. Yes, I overlooked that. There was an increase in the period from 1935 to 1938 as compared with the period from 1929 to 1934?

A. That is correct, an increase of about one casualty or a little less.

The Court: This exhibit No. 272, Mr. Sullivan, is comparable to exhibit No. 262 showing the national picture?

A. It is.

Mr. Booth:

Q. Is there anything in the figures on the face of the exhibit that might be pointed to as accounting for a portion, at least, of the increase just referred to?

A. Yes.

Q. What is it?

A. The higher casualty rate of 9.67 in the year 1937 accompanied a very heavy increase in business compared with the two preceding years of the same block and it was the heaviest business reflected by locomotive-miles since 1929. [fol. 3659] Heavy increases in business have a tendency to increase the number of casualties in a more rapid rate than the business increase.

Q. Because of the greater number of men employed?

A. The greater number of men and an increased number of new men taken into the service, and with an increase in locomotive-miles or business there is always an increase in yard and terminal switching service out of proportion to the increase in traffic.

Mr. Booth: Any questions on this exhibit, Mr. Strouss?

Mr. Strouss: No questions.

The Court: Mr. Sullivan, I notice on exhibit No. 262 that you computed your casualty rates on car-miles, train-miles, locomotive-miles, and man-hours, whereas on this exhibit the computation apparently is on locomotive-miles?

A. It could have been calculated on the other basis, but as I explained before when you take all classes of employees on duty, it includes classes of service where train-miles or car-miles are not involved, they are not accumulated, and I believe I explained my reason on exhibit No. 262 for showing all of the various bases, not that they were appropriate [fol. 3660] in all cases but to give as complete a picture of the national showing as could be reflected. Now, the train-miles and car-miles and man-hours can be calculated for exhibit No. 272, but as to individual railroads in the Interstate Commerce Commission statistics they do not make all

of the various segregations as they do for the railroads as a whole; so we are limited in our ability to draw off statistics by classes where we only use the accident bulletins themselves.

The Court: Do I understand that the Interstate Commerce Commission uses the locomotive-miles as their unit of computing these?

A. Locomotive-miles and man-hours, those two, but they make frequent reference to train-miles and other statistics in comparisons.

Mr. Booth:

Q. That is where they are considering all employees?

A. That is true.

Q. Train service and non-train service?

A. I may explain the reason for not using the man-hours or the other bases of measurement for a system showing. There are so many varied factors entering into it that rather discolor the comparisons. Various states have different full crew laws. A considerable mileage of the South-[fol. 3661] ern Pacific is in California and all of the casualty comparisons, either one state with another or even a system showing is distorted by the provisions of the California law.

Mr. Booth: We offer this exhibit in evidence as defendant's exhibit No. 272.

Mr. Strouss: No objection.

The Court: It may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 272.")

[fol. 3662] Mr. Booth: Have you prepared an exhibit showing casualties to trainmen on duty, all classes of service, sustained in train and train-service accidents reflected by statistics of the Interstate Commerce Commission, years 1923 to 1938, inclusive, Southern Pacific Company, Pacific Lines?

A. I have.

Mr. Booth: We ask that that be marked No. 273 for identification.

The Court: It may be marked.

The Clerk: Defendant's Exhibit No. 273 for identification.

Mr. Booth: Is this a companion to the preceding exhibit, No. 272?

A. Yes, with a limitation to certain class of employees.

Q. Is that limitation shown in the footnotes to the exhibit?

A. It is.

Q. And is the definition of trainmen as used in this exhibit shown in the first footnote on the face of the exhibit?

A. It is.

The Court: Does the word "trainmen" as used here, include the engineer as well?

A. It does, engineers and firemen.

[fol. 3663] Q. Is this exhibit comparable to No. 263?

A. It is.

Mr. Booth: Now, in this exhibit you have used in addition to locomotive-miles, man-hours and car-miles?

A. That is correct.

Q. Although this is a companion to Exhibit 272. Why did you use the three bases in this exhibit and only one in the other?

A. As I explained before, the other exhibit includes all classes of employees, as I explained in connection with the national exhibit, includes employees who have no connection whatever with the operation of the train, but who are subjected to the hazard of injury of the trains, for instance, car inspectors and car repairers who may be working in the train yard, the yard clerk, car checkers, maintenance of way department, B and B department, and signal department, who work on the track and structures and who are subject to injury through the operations of locomotives and trains, and in this exhibit 273 for identification, I have shown the locomotive-miles and the man-hours worked and the car-miles, so that it will present a picture both from the standpoint of exposure to injury measured by locomotive-miles [fol. 3664] and man-hours and the relation of the occurrence of casualties to the movement of a given amount of traffic measured on a car-mile basis.

Q. This includes among the term "trainmen" passenger trainmen as well as freight yard or work service trainmen?

A. That is correct.

Q. These are the employees included in these exhibits whose services accumulate car-miles in this exhibit?

A. And locomotive-miles also, it includes a class of employees, yard trainmen or yardmen and yard enginemen,

a service which does not accumulate train-miles or car-miles. That is the reason I have included the column in this exhibit "locomotive-miles".

Q. And also the reason you put in man-hours?

A. That is correct.

Q. The sources of this exhibit are fully stated on the face of it?

A. Yes, sir.

Q. You made the computations yourself?

A. I have.

Q. And is the exhibit true and correct to the best of your knowledge and belief?

A. It is.

Mr. Booth: Any questions, Mr. Strouss?

[fol. 3665] Mr. Strouss: No questions.

Mr. Booth: We offer it in evidence as Exhibit No. 273.

Mr. Strouss: No objection.

The Court: It may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 273.")

The Court: Mr. Sullivan, I notice that by referring to exhibit No. 272 and also 273, and comparing the comparable national exhibits of 262 and 263, that, for instance, on the exhibit 272, first, that your Southern Pacific, Pacific Lines, shown would indicate in the first two blocks of years, 1923 to 1928, and 1929 to 1934, that you had a higher average than what the national picture shows?

A. That is correct.

Q. And the same thing is true as to exhibit 273, comparing it with No. 263, at least on a man-hour basis, whereas, in the last block, the four years 1935 to 1938, on both exhibits the Southern Pacific showing is superior to that of the national, that is, you have a lower rate there?

The Witness: Your Honor, what exhibits were you comparing, 272 with——

The Court: 272 with 262, and 273 with 263. To restate [fol. 3666] that a little more condensed, if I have correctly interpreted your exhibits, for the first two blocks of years your total casualties on the average were in excess of the national picture, but the last four years the average of the Southern Pacific is less than the national picture.

A. Your Honor, Exhibit 273 cannot be compared properly with No. 263, because 273 includes all trainmen on duty, whereas Exhibit 263 is confined to road trainmen and enginemen.

Q. But I understood you to say that the two exhibits were comparable.

A. I must have misunderstood the reference. It is not possible to make an exhibit for the Southern Pacific using as a basis the accident bulletins of the Interstate Commerce Commission, for the reason that no segregation is made in the accident bulletin as between trainmen of the various groups for individual railroads, so I was in error when I stated that Exhibit 273 was comparable to exhibit 263.

Mr. Mason: You mean it is not possible to make an exhibit like No. 263 for the Southern Pacific?

A. That is correct.

The Court: Then may I ask you if Exhibit 272 is compar-
[fol. 3667] able to No. 262?

A. It is as to the basic data and the casualty rate on a locomotive-mile basis.

Mr. Mason: Now, Mr. Sullivan, does exhibit No. 273 include more employees than are included in No. 263? By that, I mean more classes of employees, or fewer?

A. What exhibit?

Q. 273.

A. I think the Court asked about Exhibit 272 and No. 262.

Q. You have explained that. I will ask you this, exhibit 273, if I understand you correctly, includes train and engine employees on duty in both road service and yard service?

A. That is correct.

Q. And Exhibit 263 includes train and engine employees on duty in road service but not in yard service?

A. That is correct.

Q. And that is the only reason why the two exhibits are not comparable?

A. That is correct.

Q. So that if the casualty rates on exhibit No. 273 are less per hundred million locomotive-miles, man-hours, or
[fol. 3668] car-miles, than those exhibited on 263, that is in spite of the fact that a greater class of employees is stated?

A. That is correct, in 273.

Mr. Booth: I am not sure whether I offered this exhibit 273.

The Clerk: It was admitted.

Mr. Booth: Mr. Sullivan, referring to this exhibit 274——

The Court: You haven't got to 274 yet.

Mr. Booth: Referring to this exhibit 273, casualties to trainmen on duty, you show in here the number of man-hours worked by the trainmen on duty, and in connection with the last exhibit you spoke of the influence of the increased traffic in 1937. Now, column E in this exhibit is expressed in thousands of man-hours, is it not?

A. Column C.

Q. Column C, yes. 21,519,000 man-hours worked in 1937, is that correct?

A. That is right.

Q. As compared with 19,214,000 in 1936, the preceding year; and with 17,855,000 in 1938?

A. That is right.

Q. Does that show the additional employment of men that you referred to in connection with the preceding exhibit, increase in the man-hours?

[fol. 3669] A. Well, it is reflected partly, but this represents the actual man-hours worked.

Q. Well, does this show the increased traffic also in column D of 1937 over preceding years?

A. Yes. Column D reflects the traffic in car-miles by thousands.

Q. And it shows that a larger number of car-miles were run in 1937 than was run in any year since 1929?

A. That is correct.

The Court: Hence, on a percentage basis there naturally would be more accidents, is that true?

A. Yes, any increase in traffic exposes more men to injury, but experience shows that accidents increase at a faster rate than the increase in the amount or the volume of traffic.

Mr. Booth: Can that be developed by plotting curves on some of these exhibits you have introduced here?

A. Well, partially so, but it isn't so true always with an individual railroad, but over a cycle of years, and taking the experience of railroads generally, that is what it shows, and that is what the Interstate Commerce Commission has found.

[fol. 3670] Mr. Booth: We have come to the end of our Pacific System exhibits.

The Court: The court will be at recess until ten o'clock tomorrow morning.

(Thereupon, the court stood at recess until February 6, 1941, at ten o'clock A. M.)

[fol. 3671] February 6, 1941, ten o'clock A. M.

Proceedings were resumed at this time as follows:

The Court: You may proceed.

JOHN J. SULLIVAN was recalled to the stand and testified further as follows:

Direct examination (Continued).

By Mr. Booth:

Q. Mr. Sullivan, have you prepared an exhibit entitled "Southern Pacific Company, Pacific Lines. Detail of Casualties to all Classes of Employes on Duty, Sustained in Train and Train-Service Accidents, Road Freight Train Operation, Reportable to the Interstate Commerce Commission, Years 1923 to 1939, Inclusive, State of Arizona?"

A. I have.

Mr. Booth: Consisting of twelve sheets. We ask that this be marked No. 274 for identification.

The Court: It may be marked.

The Clerk: Defendant's Exhibit No. 274 for identification.

Mr. Booth: For the years 1923 to 1935, inclusive, calendar [fol. 3672] years, from what source was this exhibit prepared?

A. From the photostatic copies of the original form T reports filed with the Interstate Commerce Commission certified to over the signature of the secretary of the Interstate Commerce Commission and the seal of the Commission.

Q. Those were procured by you for use in the Nevada Train Limit case, were they?

A. They were.

Q. Have you those certified copies here in Tucson?

A. I have.

Q. Are they available to counsel?

A. They are.

Q. For the years 1936 to 1939, inclusive, from what source was this exhibit exclusively prepared?

A. From the office files of the true carbon copies of the form T's prepared by the Southern Pacific Company for the Interstate Commerce Commission.

Q. Have you those office copies here with you?

A. I have.

Q. Will you explain the exhibits by columns on the first page, all of the columns being identical on the other pages? In the first place, it is arranged by years, is it not?

[fol. 3673] A. It is.

Q. And the items are all numbered consecutively?

A. They are.

Q. Now, please explain the columns?

A. The exhibit consists of a brief analysis in tabular form showing the date of the accident in which the casualty occurred, the location of the accident, the class prescribed by the Interstate Commere Commission for classifying the accident, the identification of the train by train number, the number of cars in the train, the speed in miles per hour, the name and occupation of the person injured, and the disability, either actual or estimated, as the case may be.

Q. As stated in the form T?

A. As stated, in most cases, in the form T; and a brief description of the accident, all of the information being shown on the form T either in tabular form or in the narrative. The accidents generally appear in chronological order, that is, for each year they appear throughout the year as they occurred, and the same operation is extended throughout the entire twelve sheets of the exhibit.

Q. I notice that the title of this exhibit says "Reportable [fol. 3674] to the Interstate Commerce Commission." Did you make an independent examination of certain company records to determine whether these form T's actually embrace all of the accidents for that period?

A. I did for the period from 1923 to 1935, inclusive.

Q. What did you examine?

A. I examined the certified copies of the form T reports, the records of the general claim agent, whose responsibility it was to receive reports and make settlements in connection

with personal injuries, and admission records and treatment records of the general hospital department.

Q. What do you mean by "general hospital admission records?"

A. When an injured employee or one who is ill is admitted to the general hospital of the company, or treatment for illness or injury is made to an employee, a report is maintained in the general hospital department of such injuries.

Q. To the best of your knowledge and belief, is this exhibit true and correct as to what it purports to be?

A. Yes, but in connection with the questions that I was just asked pertaining to the detail list of casualties in the [fol. 3675] state of Arizona covered by Exhibit 274 for identification, there were no casualties reportable that were not reported to the Interstate Commerce Commission.

Q. This is confined to all classes of employees on duty sustained in train and train-service accidents?

A. In road freight train operation.

Q. In road freight train operation?

A. That is correct.

Mr. Booth: Any questions, Mr. Strouss?

Mr. Strouss: Do you know whether the reports were made to the Arizona Corporation Commission on these same accidents?

A. I don't know of my own knowledge; but I do know that for some of the early years, copies of the original reports could not be found in the office of the Corporation Commission in 1929, but at that time carbon copies of the records were available, and we found that the reports had been made to the Corporation Commission.

Q. The practice now is to make the same reports, same type of report to the Arizona Corporation Commission as is made to the I. C. C.?

A. That is correct, and on the same basis.

Q. Do you know how long that practice has prevailed?

[fol. 3676] A. I don't know how much earlier, but I know that the practice was in effect in 1916.

Q. Their forms did vary, however, for a while?

A. They did; they were not uniform, I don't recall the year, but it has been a number of years ago, the Corporation Commission adopted as their rules the rules of the In-

terstate Commerce Commission for the reporting of train and train-service accidents.

The Court: This exhibit covers any casualties to those who work on the tracks, such as section hands?

A. Yes, if road freight train operation was responsible for the injury.

Q. I notice also that a special officer is listed here in one of the exhibits, or one of the sheets.

A. That is correct, your Honor, and likewise if reference is made to item 28 on the first sheet, you will find reference to a water service foreman. All classes of employees on duty, regardless of their occupation, are shown on this exhibit, if the injury was received incidental to the operation of a road freight train.

Mr. Booth: Does this include accidents in yards while [fol. 3677] a road freight train was being made up or broken up?

A. No, that is not considered under the rules road freight train operation.

Q. But if an accident occurs while a road freight train is coming into the yard, and before it is turned over to the yard crew for handling, that accident would be in here?

A. If the train is still in charge of the road crew, it would be reported.

Q. And similarly, after a train is made up in the yard, and is taken charge of by the engineer, conductor and the other members of the crew, and the accident occurs either while the train is standing still or getting under way, that would be reported?

A. If the employee was on duty in connection with it.

Q. That would be included in this exhibit?

A. It would.

Mr. Booth: We offer this in evidence as defendant's Exhibit No. 274.

Mr. Strouss: No objection.

The Court: It may be admitted.

(The document referred was received in evidence and marked "Defendant's Exhibit No. 274.")

[fol. 3678] Mr. Booth:

Q. Mr. Sullivan, have you prepared an exhibit consisting of seven sheets similar to exhibit No. 274, identical in title with the exception that it relates to the state of Nevada?

A. I have.

Mr. Booth: May we have this marked for identification as No. 275?

The Court: It may be marked.

The Clerk: Defendant's exhibit No. 275 for identification.

Mr. Booth:

Q. Of how many items does this exhibit consist?

A. 275.

Q. Are the items numbered consecutively on the lefthand margin from 1 to 275, inclusive?

A. They are, beginning with No. 1 on the first sheet.

Q. Opposite what items and in column No. 9 are found the letters "(N. R.)" in capital letters and brackets and please give the page of the exhibit and the number of the item?

A. On sheet No. 3 of the sheet, item 122; sheet No. 4, item 141.

Q. That covers injury to two persons, does it not?

A. It does. Item 142, item 164; sheet No. 5, item 176, [fol. 3679] item 178, item 188, item 190, item 198.

Q. You have given nine items with two injuries in item 141, or ten injuries altogether?

A. That is correct.

Q. What do the letters "N. R." stand for in this exhibit?

A. As indicated in the legend of the sheets, each was a casualty that was properly reportable under the rules, but was not reported on form T to the Interstate Commerce Commission.

Q. Did you make the same check of records in the superintendent's office, hospital department, and the claims attorney's department in the course of preparing for the trial of the Nevada Train Limit case that you did as to Arizona as you have described?

A. I did.

Q. Were these items developed by you, these items that were not reported in the course of that check?

A. They were.

Q. Did you prepare exhibits in the Nevada Train Limit case making a showing of reportable casualties in Nevada for the years 1923 to 1935, inclusive?

A. Yes, there were two series of exhibits. The first ex-
[fol. 3680] hibits were for the years 1923 to 1934, and later the figures for the year 1935 had become available and the previous exhibits were brought up to date to include the year 1935.

Q. Were these items shown as not reported, in this exhibit, finally included in the exhibits in the Nevada Train Limit case?

A. They were finally.

Q. As to the items in this exhibit No. 275 for identification which are not marked with the letters "N. R.", from what source is the information taken?

A. For the years 1923 to 1935, inclusive, from the certified photostatic copies of the original reports made to the Interstate Commerce Commission as I have previously described.

Q. That is, you had available at that time certified copies of both Arizona and Nevada of the form T reports?

A. Before the exhibit was finally completed.

Q. From what source were the items in this exhibit taken as to the items not marked with "N. R." from January 1, 1936, to December 31, 1939?

A. When the fact that these reportable accidents——

Mr. Booth (Interrupting): I don't think you got my
[fol. 3681] question.

The Court: Read the question.

(The question was read by the reporter.)

A. From the true carbon copies of the office files of the original form T's made by the Southern Pacific Company to the Interstate Commerce Commission.

Mr. Booth:

Q. Have you here in Tucson at our office across the street from the courthouse the certified copies you have referred to?

A. I have.

Q. Have you the office copies, the record copies of the form T's from January 1, 1936, to December 31, 1939?

A. I have.

Q. Is this exhibit true and correct to the best of your knowledge and belief?

A. It is.

Mr. Booth: I will state to the Court that we haven't here in the courtroom or in Tucson any supporting documents for these items marked "N. R." We were in this position in regard to those, we couldn't very well produce an exhibit before the court and call it an exhibit of reported accidents when the records in the Nevada case show very clearly there were nine accidents and ten casualties that [fol. 3682] were not reported to the Commission. It is my understanding that in all probability the files in the superintendent's office showing those accidents have been destroyed. The law requires them to be kept for only three years, and storage space is a considerable item in the division office. I am pretty sure that enough of the claims department files are in existence to identify these accidents and perhaps give a description of them, and it may be that the hospital department records are in existence, although that I doubt. I will undertake to bring those here, whatever we can find, if the superintendent's files haven't been destroyed; and I will have those here as to the nine accidents when we resume after a brief recess.

Mr. Strouss: I don't think you need to do that, Mr. Booth, unless I should ask for them. I would like to look the exhibit over before I say I would not want those records, but now my anticipation is that I would not require you to bring them, but I would like to look the exhibit over first.

The Court:

Q. Mr. Sullivan, why weren't these accidents reported?

A. I don't know, sir. It may be inadvertence; but of my own knowledge I do not know why they were not reported. [fol. 3683] I had no jurisdiction or responsibility in Nevada at the time these accidents occurred and were not reported; I was working on another part of the system.

Q. There is no such occurrence here in the exhibit affecting the state of Arizona?

A. No, sir, not a single one.

Q. I notice these last two exhibits cover the years 1923 to 1939, inclusive, whereas your national showing only brought it up to and including the year 1938?

A. As to the Southern Pacific, all basic data and records are available for 1939 and, as I explained yesterday, the statistical accident bulletin for the year 1939 has not yet been distributed by the Interstate Commerce Commission.

Q. Another thing, in the case of exhibit No. 274 which covers the casualties in the state of Arizona, I understand that is all of the casualties occurring within the physical boundaries of the state and is not limited to the Tucson division?

A. It includes not all of the casualties; but it includes all casualties to employees on duty within the physical boundaries of the state of Arizona involving road freight train operation only.

[fol. 3684] Q. Those things that it purports to show?

A. That is correct.

Q. Is the same thing true of exhibit No. 275, it doesn't cover the Salt Lake division but it actually covers the casualties occurring in freight train operation within the physical boundaries of the state of Nevada?

A. That is correct.

Mr. Booth:

Q. These are special studies not found in any published statistics, are they?

A. It is a special study and not found in any statistical showing of any kind.

The Court: In the ordinary course of events, I presume you would keep track of these accidents by divisions, would you not?

A. That is true.

Q. This is a special study to compile these particular exhibits?

A. That is correct.

Mr. Booth:

Q. For what length of time can you estimate were you at work on these two exhibits, including your work in the Nevada case and your work in preparation for this case?

A. It would be hard to say for the particular exhibits, but in preparation for the Nevada case all of the statistical showing and some operating testimony I was at work for a [fol. 3685] year. In preparation for the trial of this case, about seven months.

The Court: I understood the question had reference to the length of time it took you to make this particular study in connection with these exhibits?

A. I couldn't determine or state the amount of time for this particular study, because it was all interrelated, and a number of exhibits have their foundation in this particular detailed list.

Mr. Strouss: I don't see where that has any relevancy anyway.

Mr. Booth: It has this relevancy, we didn't go to the trouble and expense of making a system showing as elaborate as this. This explains the reason why we made the system showing by Interstate Commerce Commission statistics, and made this showing by states.

Mr. Strouss: There is one part of the testimony before this exhibit is offered that I want to move to strike and that is as to these nonreported casualties having been admitted in evidence in Nevada. That is hardly competent or relevant testimony before this court.

Mr. Booth: I made that as a statement to the court. If [fol. 3686] it is evidence, it may go out.

The Court: It may be stricken because this case must stand on its own bottom and not on what may have occurred in Nevada.

Mr. Booth: I was explaining our quandary in preparing this exhibit.

Q. Mr. Sullivan, in 1935 was a checking system put into effect in the general manager's office to obviate the occurrence or recurrence of failure to report reportable casualties?

A. It was.

Q. Of what did that consist and is it in effect now?

A. Accidents are reported to the general manager by telegraph, and in those cases where injuries occur a copy of the telegraphic report is passed to an organization known as the "Central Timekeeping Bureau." That accident report is kept in what is termed "suspense" and checked to see whether or not time is lost by the employee shown on the report and if loss of time is indicated it serves as an index for reporting the accident in the event it might have been overlooked. It is used as a checking basis only.

Q. Has that system been in effect since 1935?

A. It was placed in effect in 1935.

[fol. 3687] Q. And has been in effect since?

A. I don't know; I presume that it has.

The Court:

Q. Mr. Sullivan, with reference to both those last two exhibits introduced this morning, I notice there is no summary in connection with it. Does the report itself, is it possible to summarize the data therein contained?

A. Summaries will be offered in exhibits later.

Mr. Booth: We offer this exhibit in evidence as defendant's exhibit No. 275.

Mr. Strouss: I object to it as irrelevant and immaterial.

The Court: Objection overruled, it may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 275.")

[fol. 3688] Mr. Booth: Mr. Sullivan, did the certified copies of the form T's for Arizona and Nevada for the years 1923 to 1935, inclusive, to which you have referred in connection with the two preceding exhibits, and which you have here in Tucson, include all reported accidents to all classes of employees on duty in all classes of service?

A. Yes.

Q. And have you examined, and have you with you here in Tucson, the office copies to which you have referred, of all form T's for the calendar years 1936 to 1939, inclusive, for all classes of employees on duty in all classes of service in the states of Nevada and Arizona?

A. I have.

Q. Have you prepared an exhibit in one sheet entitled "Comparison of Casualties to all Classes of Employes on Duty, all Classes of Service, Sustained in Trains and Train-Service Accidents, Reportable to the Interstate Commerce Commission for the years 1923 to 1939, Inclusive, Southern Pacific Lines, States of Nevada and Arizona?"

A. I have.

Mr. Booth: We ask that that be marked No. 276 for identification.

[fol. 3689] The Court: It may be marked.

The Clerk: Defendant's Exhibit No. 276 for identification.

Mr. Booth: Will you please describe this exhibit, Mr. Sullivan?

A. The exhibit is arranged to show the information by years from 1923 to 1939, inclusive, subdivided into cycles of years, the two early periods six and six years respectively, and the last cycle a five-year period, 1935 to 1939. The source of the figures of total locomotive miles, thousands, for Nevada, is the annual report of the Southern Pacific Company to the Public Service Commission of Nevada, Column C, showing the same information for Arizona, is from annual reports of the Southern Pacific Company to the Arizona Corporation Commission. The data shown in columns D to G, representing the employes on duty killed and injured in Nevada and Arizona, are from the form T reports which I have previously referred to. Columns H and I, showing the total casualties, and columns J and K, showing the casualty rate on a locomotive-mile basis, as well as the figures in items or lines 7, 14, and 20 to 26, inclusive, are computations by me. The exhibit as to casualties to all classes of employees on duty includes all classes of service, including freight, passenger and [fol. 3690] yard.

Q. I see you have put on here a table showing the main track mileage. Is that table correct in accordance with what it purports to state?

A. It is. It represents the main track mileage, both main line and branch, as described in the block at the foot of the exhibit for both Arizona and Nevada.

Q. You have a footnote here opposite the star, "Includes 13 killed and 12 injured in derailment of streamliner City of San Francisco at Harney, Nevada, August 12, 1939, caused by malicious tampering with the track." Now, have you with you here the quarterly report of the I. C. C. Bureau of Investigation finding that that accident was caused by malicious tampering with track?

A. I haven't the quarterly summary, but I have a copy of the individual report.

Q. By the way, how many cars did that train have?

A. I also have the quarterly bulletin, I beg your pardon; and I have the individual report also. It was a fourteen-car train.

Q. Streamlined?

A. Yes.

Q. Steam or Diesel power?

[fol. 3691] A. Diesel powered.

Mr. Booth: Have you any questions, Mr. Strouss, on this exhibit?

Mr. Strouss: These locomotive-miles, of course, includes helper locomotives and light locomotives?

A. It includes all locomotive-miles, Mr. Strouss, including yard locomotive-miles, light and freight, as well as passenger train.

Mr. Booth: The exhibit includes yard accidents?

A. That is correct.

Mr. Booth: We offer the exhibit in evidence.

Mr. Strouss: Objected to as irrelevant and immaterial.

The Court: The objection is overruled. It may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 276.")

Mr. Booth: Mr. Sullivan, have you prepared an exhibit in the same form as exhibit No. 276, but showing merely a comparison of casualties to all classes of employees on duty, road freight train operation, Southern Pacific Lines, states of Nevada and Arizona?

A. The exhibit is similar but it shows different basic data and the casualty rate on additional bases, but it is confined solely to a showing for the states of Nevada and [fol. 3692] Arizona.

Q. I omitted to ask you with reference to Exhibit No. 276 whether that exhibit includes the nine non-reported accidents and ten casualties which were testified to in connection with the list of accidents in Nevada?

A. It does.

Q. Does this exhibit No. 277 for identification include those?

A. It does.

Q. Will you please describe the exhibit, the sources from which it is derived?

A. The exhibit is prepared the same as the one immediately preceding it, showing the figures by years and cycles of years, the basic data. Freight train miles and freight train car-miles for Nevada in columns B and D were obtained from the annual reports of the Southern Pacific Company to the Nevada Public Service Commission; columns C and E for Arizona from the annual reports of the

Southern Pacific Company to the Arizona Corporation Commission; the figures in columns F, G, H, and I from the form T reports, as previously described, and for the state of Nevada the ten casualties which were not reported but which are detailed on Exhibit No. 275; the figures in columns J and K indicating the total casualties, and columns [fol. 3693] L and M, showing the casualty rate on train-mile basis, and N and O, the casualty rate on a car-mile basis; and the figures in items or lines 7, 14, and 20 to 26, inclusive, are computations by myself. I may state that I have used the freight train-mile basis and the car-mile basis, the train-miles basis being a measurement of the exposure to injury, and the car-mile basis a measurement of casualties against the movement of a given amount of traffic.

Q. Is this exhibit true and correct, to the best of your knowledge and belief?

A. It is.

Mr. Booth: Any questions, Mr. Strouss?

Mr. Strouss: This exhibit, I note, has on the bottom, "Comparison of main track mileage operated as of December 31, 1939." Of course, that mileage is not the same as was operated in 1923, for example?

A. No, that is correct. In fact, it changes from year to year.

Q. In 1923, in Arizona, neither the E. P. & S. W. Lines, nor the Arizona Eastern had been added to the Southern Pacific Company's operations at that time, had they?

[fol. 3694] A. They had not.

The Court: Well, this last exhibit has to do with the freight train operations and is a further break-down of 276. In other words, the casualties shown there in 276 are included in this exhibit 277?

A. That is correct as to road freight train operations. In other words, we have eliminated in exhibit 277 the casualties that might have occurred in other classes of service other than road freight train operation.

Mr. Booth: We offer this in evidence as defendant's Exhibit No. 277.

Mr. Strouss: Objected to as irrelevant and immaterial.

The Court: The objection is overruled. It may be admitted.

(The document referred to was received in evidence, and marked "Defendant's Exhibit 277.")

Mr. Booth: Have you prepared an exhibit in one sheet showing the casualties to all classes of employees on duty in road freight train operation sustained in train and train-service accidents reportable to the Interstate Commerce Commission, classified as to causes and classes of employees for the years 1923 to 1935, inclusive, for the states [fol. 3695] of Nevada and Arizona?

A. I have.

Mr. Booth: We ask that this be marked for identification as defendant's Exhibit 278.

The Court: It may be marked.

The Clerk: Defendant's Exhibit No. 278 for identification.

Mr. Booth: To which of your exhibits is this a supplement?

A. No. 277.

Q. Should No. 277 be inserted in the fourth line in the title to the exhibit?

A. It should.

Mr. Booth: May the Clerk make that insertion?

The Court: Yes, it may be inserted.

Mr. Booth: Now, will you explain this exhibit, Mr. Sullivan?

A. In the submission of form T's by the carrier to the Interstate Commerce Commission, the rules require that the class of train accident or train-service accident be incorporated in the proper place on the form. As I have previously described, train accidents are subdivided into five general classes, train-service accidents in ten subdivisions.

Q. Major subdivisions?

[fol. 3696] A. Well, they are subdivisions. Train service accident is really the major subdivision, and these ten subclasses are subdivisions of train service accidents. For instance, an accident occurring to employees while coupling or uncoupling locomotives or cars, is shown as I. C. C. class S-a, likewise coupling or uncoupling air-hose, S-b, operating locomotives, S-c, operating handbrakes, S-d, and so on. The casualties included on exhibit 277 have been

classified on exhibit 278 for identification, both as to the class of accidents and the class of employees, columns C to F, showing the injuries reportable to conductors, brakemen and flagmen; columns G to J to engineers and firemen; columns K to N to all other classes of employees other than conductors, brakemen, flagmen, engineers and firemen, and columns O to R, inclusive, show the total for all employees. These casualties are grouped into cycles of years for the same period as indicated on exhibit 277 and a grand total has been computed in item or line 16 to show for the various three periods, six years, six years, and five years, respectively, and a grand total, the total number of casualties, both killed and injured, occurring in those years for each of the described classes of employees. It is a break-
[fol. 3697] down of exhibit 277 by causes and classes of employees.

Q. What does "locomotive boiler (B)" include in the way of accidents?

A. That would include any casualties resulting from the explosion of a locomotive boiler.

Q. And the next item 4, "other locomotive (L)"?

A. That would include any other defect or failure in a locomotive where the damage to the equipment or the company property exceeded $150 and employees had been injured in that type of accident, such as the failures of rods, wheels or tires, locomotive axles, or any other appurtenances of the locomotive itself.

Q. Suppose an employee had been injured to the extent of losing more than 72 hours' time and the damage did not amount to $150, but was due to some part of the locomotive breaking, would that be shown on here?

A. If it was either the engineer or fireman operating the locomotive, it would be shown in item 8, "operating locomotives."

Q. Is this exhibit true and correct, to the best of your knowledge and belief?

A. It is.

Mr. Booth: Any questions, Mr. Strouss?

[fol. 3698] Mr. Strouss: No questions.

Mr. Booth: Your Honor?

The Court: No.

Mr. Booth: We offer this in evidence as defendant's exhibit No. 278.

Mr. Strouss: Objected to as irrelevant and immaterial.

The Court: The objection is overruled. It may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 278.")

Mr. Booth: According to this exhibit, there has been no locomotive boiler explosion causing a casualty in either of these states?

A. That is correct.

Q. During the period covered by this exhibit?

The Court: That would be such an occurrence as happened in Denver in the last two weeks on the D. & R. G.?

A. It would be, your Honor, if the press reports are correct.

Mr. Booth: What class of accidents would this item 13 cover, "Accidents at Highway Grade Crossings?"

A. That would include injuries to employees in a grade crossing accident on account of the operation of a locomo-
[fol. 3699] tive, or train, or car colliding with a vehicle or striking a pedestrian where a derailment did not occur, and where there was damage less than $150 to the company property or equipment. If a derailment or other train accident occurred where damage to railroad property or equipment exceeded $150, it would be reported in item 5, miscellaneous train accidents.

Q. Now, let us turn back to defendant's Exhibit 274, item 10, "J. Breseno, track walker, 13 days' disability," would that be shown on this exhibit 278? I mean, would it be included in it, and, if so, in what subdivision?

A. That would be reported in item 14 of exhibit 278, "struck or run over by cars or locomotives," or, depending upon the circumstances, it may be included in item 15. That particular casualty is reported in item 14.

Q. On sheet 4 of this exhibit 274 you have item 140, "J. Chavez, track laborer, struck by train, ten days' disability." Now, from that description can you tell in what item the accident would fall in No. 278?

A. Item 14, S-i, struck or run over by cars or locomotives; and it would be shown under the column "All other employees," column N, the accident having occurred in
[fol. 3700] Arizona.

Q. Would this table include an employee dead-heading in a caboose on his way to an assignment for service?

A. No, because an employee deadheading is not considered on duty.

The Court: He is being paid, isn't he?

A. Yes, but the Interstate Commerce Commission classes employees traveling but not on duty even though under pay as employees off duty.

Q. Is that included in their classification of "time paid for but not worked?"

A. Yes, sir. I may describe that further. If the deadheaded employee is traveling on a passenger train, under the rules of the Commission he would not be classified as an employee either on duty or off duty, but as a passenger.

The Court: Then, would he receive any protection if he was injured?

A. You mean from the standpoint of compensation?

Q. Yes.

A. I think he would. That is out of my department, but I think they do.

Mr. Booth: Suppose I was injured coming down here to Tucson, would I be classified as a passenger?

[fol. 3701] A. Yes, sir.

The Court: We will take our morning recess.

(Thereupon, a short recess was taken, after which the witness was recalled to the stand, and proceedings were resumed as follows:)

[fol. 3702] Mr. Booth: Mr. Sullivan, have you prepared an exhibit in one sheet that is a further breakdown of exhibit No. 277 and relates to road freight conductors, brakemen, and flagmen on duty exclusive of engineers and firemen?

A. I have.

Mr. Booth: We ask that that be marked as "Defendant's Exhibit No. 279"?

The Court: It may be marked.

The Clerk: Defendant's exhibit No. 279 for identification.

Mr. Booth:

Q. This exhibit is in the same form and from the same sources and on the same basis as exhibit No. 277, is it not?

A. That is correct.

Q. What employees included in exhibit No. 277 are excluded from this exhibit?

A. All classes of employees are excluded except road freight conductors, brakemen, and flagmen on duty.

Q. The term "flagmen" is applied to the rear brakemen where it is used without any qualification, isn't it?

A. Yes, that is a term used by the Interstate Commerce Commission in their classification of employees, but the [fol. 3703] flagman is one of the brakemen on the freight train crew.

Q. Referred to by that term, I believe, in the Arizona full-crew law, is it not?

A. Yes, sir.

Q. Will you describe this exhibit, please?

A. The exhibit is prepared in exactly the same form as exhibit No. 278. The basic figures in columns B to E are the same freight train-miles and freight train car-miles. Columns F, G, H, and I are the casualties to road freight conductors, brakemen, and flagmen on duty only but which are included also in the preceding exhibit No. 277. Like the other exhibits, columns J to O, inclusive, and the figures in lines 7, 14, and 20 to 26, inclusive, are calculations by myself.

Q. These casualty rates are estimated on the basis of per million train-miles and per hundred million car-miles.

A. Not estimated, but calculated on the basis of per million train-miles and per hundred million car-miles. As I previously explained, train-miles to show the relative exposure to injury, the car-mile basis to indicate the occurrence of casualties in the movement of a given amount of traffic.

The Court: Mr. Sullivan, from these various exhibits it would appear that as compared with the engineers and [fol. 3704] firemen the conductors, brakemen, and flagmen have a more hazardous occupation?

A. There are more injuries, that is true. Of course, there is an explanation that may be seen by an examination of exhibit No. 278. Engineers and firemen, except in unusual cases, are not required to couple or uncouple locomotives or cars or air hose or steam hose or safety chains. In the performance of their duties, they are always on the moving

locomotive, they are not required to get on and off a moving locomotive. They are not required to operate hand brakes and rarely are required to operate switches unless they are on a light engine, and it is seldom while they are on duty that they are exposed to the other type of injury, being struck or run over by locomotives or cars. As to engineers and firemen they are exposed to one type of accident that only one member of the train crew is exposed to and that is collisions and the collisions and derailments resulting from striking vehicles at grade crossings.

Mr. Strouss: That does not include all collisions, does it, as classified by the Interstate Commerce Commission?

A. Yes, if they were injured, they would be included be-
[fol. 3705] cause this exhibit includes both train and train-service accidents.

Q. When you say "collisions" that includes collisions between cars that may be switched or collisions of that sort as well as collisions between engines?

A. That is true, but head-on collisions invariably involve one or more locomotives and the engineer and fireman on those locomotives.

Q. Of course the trainman would be exposed if he were on cars that collided in switching?

A. Yes, and the trainmen are exposed to the rear-end collisions.

Mr. Booth: We offer this in evidence.

Mr. Strouss: I object to it as irrelevant and immaterial.

The Court: Objection overruled, it may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 279.")

Mr. Booth:

Q. Following that thought a little further regarding the relative exposure to hazard of engineers and firemen as contrasted with the conductors and brakemen, there is only one engineer and he is matched by one conductor, is that correct?

[fol. 3706] A. That is correct.

Q. And one fireman, you could match him off with the head brakeman?

A. That is correct.

Q. There is always at least one more brakeman and sometimes, or usually, more than one?

A. For the purpose of this exhibit, there are at least two, both in Arizona and Nevada.

Q. So that that would have to be taken into consideration?

A. Yes, there are more road conductors, brakemen, and flagmen exposed to injury than there are engineers and firemen.

Q. You are familiar with the operating rules of the Southern Pacific Company as they have existed during your period of service, are you not?

A. Yes, sir.

Q. You have been train master on this division and assistant superintendent on the divisions you mentioned in your testimony?

A. Yes.

Q. Inspector of transportation and so on?

A. Yes.

Q. What do our rules require and what is the practice where a train takes a siding for another train to meet or pass it with respect to the brakeman getting on and off the [fol. 3707] train that takes the siding?

A. It is required that someone throw the switch for the train to enter the siding and if it is a train on which a train crew is employed it is the duty of a member of the train crew to get off the train and throw the switch. Leaving the siding, the switch must be thrown back for the main line and the member of the train crew must board the train before it proceeds from that station.

Q. Under our operating rules and practices, when the train approaching a siding intending to take that siding for the purpose of allowing another train to meet or pass it, does the head brakeman usually throw the switch?

A. Yes, that is the invariable practice.

Q. Who closes the switch as the train leaves the siding?

A. A member of the train crew, usually the rear brakeman but occasionally the conductor.

Q. Does the rear brakeman have to close the entering switch after the train has gone into the siding?

A. Yes.

Q. And open the leaving switch as the train departs?

[fol. 3708] A. No, the head brakeman usually opens the leaving switch when the train departs and usually the rear

brakeman closes the switch after the train has left the siding.

The Court: That necessitates bringing the train to a stop or practically so?

A. Practically so but not always. It depends upon the conditions generally. Pulling out of a siding, it is the invariable practice for the engineer to control the movement of the train at such a slow speed that the brakeman is able to get off, throw the switch, and run and catch the caboose.

Mr. Strouss: If the Court please, I move that be stricken, "invariable practice." That is a conclusion which the witness certainly couldn't know as to what every engineer does.

Mr. Booth:

Q. Is it the practice as you have observed it?

A. It has been the practice as I have observed it and I have ridden in the caboose of a great many freight trains.

The Court: The expression, "invariable practice," may be stricken.

Mr. Booth:

Q. Are there any comments you desire to make on this exhibit No. 279?

[fol. 3709] A. The exhibit has been prepared in such a way that the casualty rates both on a train-miles basis and on a car-mile basis may be readily compared, one state with the other. It has also been prepared in such a way that the trend represented by the various casualty rates may be followed from the earlier years to the latest and through the intermediate years, and also the average casualty rates for the indicated periods of years may be compared one with another and the trend indicated by the rates may be followed from one group of years to the others. In the block represented by lines 22 to 26, inclusive, the percentage figures indicate the decrease in the casualty rates, one period with another, for each of the states and on both a train-mile basis and a car-mile basis. The exhibit itself shows, for instance, referring to column N for Nevada, that the casualty rate on a car-mile basis which represents, of course, injuries to road freight conductors,

brakemen, and flagmen, that the rate was 39.34, whereas in 1939 it had decreased to 4.86. Likewise, in Arizona the rate in 1923, while it was lower than Nevada, it has decreased to 10.51 in 1939, but in that year the rate is still over twice as much in Arizona than in Nevada. For the total seven-[fol. 3710] teen years, it will also be noted that the average casualty rate in Arizona is almost twice that in Nevada. The same comparison may be run through in the casualty rate on a train-mile basis or for any year or cycle of years that are shown and calculated.

The Court: It is true, however, that there is a fourth more mileage in Arizona than there is in Nevada, approximately?

A. The main track mileage over which practically all freight train miles are operated is relatively the same. There are 808.29 main track miles on the main line in Arizona and 819.82 in Nevada. But even if there was a difference, that is compensated for on the basis against which the casualties are measured. Regardless of the mileage, if you had no freight train miles operating, there wouldn't be any employees and there wouldn't be any casualties; for it is only in the movement of freight trains and the movement of freight train cars that we produce the casualties to road freight conductors, brakemen, and flagmen on duty.

Mr. Booth:

Q. I notice in the first block, that is the block of 1923 to 1928, inclusive, the average for those six years on a train-mile basis is 11.44 casualties per million train-miles [fol. 3711] in Nevada and 15.07 in Arizona?

A. That is correct.

Q. Can you give the approximate figures of the statistical length of freight trains in those two states for those six years arrived at by dividing the car-miles by the train-miles?

A. It can be calculated. In Nevada for the six years, 1923 to 1928, the statistical average would be about 58 cars and Arizona, 52.

Q. Take the approximate statistical average for the years 1935 to 1939, inclusive?

A. In Nevada, 77 cars plus, slightly over 77 cars; and Arizona, slightly over 55.

Q. All those figures you gave include the caboose, do they not?

A. Yes, that is simply calculated by dividing the freight train car-miles by the freight train miles.

Q. Have you any added comments on this exhibit?

A. No, sir.

Mr. Strouss:

Q. This includes all operations in either state?

A. It includes all freight train operations.

Q. That would be branch and main line?

A. That is correct.

Q. What about yard?

[fol. 3712] A. No, it does not include yard. Road switching, where it is in charge of the road freight train crew is included in this showing.

Q. That is the way road switching is classified as distinguished from yard, isn't it, the road crew does the switching?

A. They do the switching where a yard engine is not employed.

Q. That would be classified as road switching? I ask that because of the former showing of the distinction on the records of the company as between road switching and yard switching.

A. I don't quite understand your question.

Q. If locomotive-miles in road switching were shown for a division, that would mean the switching was done by the train crew rather than the yard crew?

A. There are no locomotive-miles on these exhibits.

Q. I am asking as to the distinction between road switching and yard switching?

A. Independent of this exhibit?

Q. Yes.

A. That is true. There is a calculation made of switching and that is classified in the Interstate Commerce Com-[fol. 3713] mission rules as road switching. That is included in the locomotive-miles classification.

Q. That type of road switching would be included here, because it would be done by the train crew?

Mr. Mason: I take it you mean if casualties occur, such casualties are included here?

Mr. Strouss: In the train-miles.

The Witness: No, there are no train-miles or car-miles accumulated by switching.

Mr. Strouss: Not even road switching?

A. No, sir.

Mr. Booth: Only locomotive-miles?

A. That is correct.

Q. Have you prepared an exhibit, Mr. Sullivan, making a breakdown of exhibit No. 279 to show the comparison between the states of Nevada and Arizona for the same period of casualties caused from sudden stopping, starting, lurch, and jerk of train?

A. I have.

Mr. Booth: We ask that that be marked "Defendant's Exhibit No. 280"?

The Court: It may be marked.

The Clerk: Defendant's exhibit No. 280 for identification.

[fol. 3714] Mr. Booth:

Q. Upon what is this exhibit based?

A. The exhibit is based, as in the case of the previous exhibits, on reports of casualties made by the Southern Pacific Company to the Interstate Commerce Commission with the exception that it also includes for the state of Nevada any of the casualties which were not reported and which were caused from sudden stopping, starting, lurch, and jerk of train.

Q. Insofar as casualties are concerned, this is based on exhibits Nos. 274 and 275 which list the casualties in those two states, is that correct?

A. Yes, reference to that will be found there, and references made on exhibits Nos. 274 and 275 to that particular class of casualty by an index reference that is shown at the foot of the sheets on exhibits Nos. 274 and 275, the reference being shown in column No. 3.

The Court: Mr. Sullivan, these casualties caused from sudden stopping, starting, lurch, and jerk of train, do they fall into any particular classification shown on your exhibit No. 278?

A. They could fall under item 2 or item 5 for train accidents. Item 15, which covers the train-service accidents, [fol. 3715] and in each case on exhibits Nos. 274 and 275

they may be traced through the class of Interstate Commerce Commission accidents under column No. 3, which is preceded by the index indicating that the casualty was caused from sudden stopping, starting, lurch, or jerk of train. For instance, item 3 in exhibit No. 275 shows an injury to a brakeman on a 50-car train due to the engineer applying brakes in an emergency to avoid running over the derail. It will be noted that the Interstate Commerce Commission class for that particular accident is S-j. That would be included in that group of miscellaneous train-service accidents covered by exhibit No. 278. Likewise, item 8 shows an Interstate Commerce Commission class M-b in which a brakeman was injured. That is included in item 5, miscellaneous train accidents, on exhibit No. 278 and likewise throughout. In other words, the index of the class of accident is shown in each case on exhibits Nos. 274 and 275 in column No. 3.

[fol. 3716] Mr. Booth: Now, does this exhibit 280 for identification include those accidents, and only those accidents that are identified by the cross mark or number mark in column 3 of exhibits 274 and 275?

A. Yes, that is correct.

Q. Will you describe the exhibit briefly, please?

A. As to the form and the basic data as to freight train-miles and freight train car-miles it is the same as exhibit No. 279; likewise, it only includes the same class of employees, road freight conductors, brakemen and flagmen on duty, but it is confined to the casualties caused by the causes indicated in the title of the exhibit. Columns J to O, inclusive, and in lines or items 7, 14, and 20 to 26 inclusive, are calculations by myself.

Q. Is this exhibit true and correct, to the best of your knowledge and belief?

A. It is.

Mr. Booth: Any questions, Mr. Strouss?

Mr. Strouss: No questions.

Mr. Booth: We offer it in evidence as defendant's Exhibit 280.

Mr. Strouss: Objected to as irrelevant and immaterial. [fol. 3717.] My objection, if the Court please, I want to say, on these exhibits, is going particularly to the Nevada part of it.

The Court: I so understood it. The objection is overruled. It may be admitted in evidence.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 280.")

The Witness: I want to invite attention to the figures in columns D and E, which apply equally to the companion exhibits, which is confined to road freight trains and the road freight conductors, brakemen and flagmen, that for the 17 years and for the intermediate cycles of years the traffic measured in the freight train car-miles shown in column D and E is practically the same, in Nevada it being slightly more, the 17 years, two billion two hundred twenty-six million, seven hundred sixty thousand, and in Arizona two billion, one hundred twenty-seven million, five hundred fifty-four thousand.

The Court: Your long train operations in Nevada are clearly disclosed by those columns B, C, D and E, in that, as you have just pointed out, your freight train car-miles were more in the state of Nevada than they were in Arizona during the entire period, whereas the train-miles were [fol. 3718] very substantially less in Nevada than they were in Arizona?

A. That is correct.

Mr. Booth: Does that finish your statement, Mr. Sullivan?

A. Yes.

The Court: Isn't it true, Mr. Sullivan, that this is the first exhibit, that I have observed, at least, that shows more casualties in the state of Nevada than in the state of Arizona during the period in question?

A. That is true, but possibly at this point I could invite the Court to refer to exhibit 275, and by an examination of that exhibit it will be found that of the 114 casualties occurring in Nevada, 24 of them occurred on trains of seventy cars and less, 90 on trains of over seventy cars, so, if you should take the casualties shown in columns J and K, in exhibit 280, it will be found that there were 92 in the two states on trains of seventy cars or more, and 124 on trains of seventy cars or less.

Mr. Booth: Is there any Arizona casualty included in this table that happened on a train of more than seventy cars?

A. Yes, in 1937, there were two casualties on a train of [fol. 3719] over seventy cars.

Q. A train at Yuma?

Mr. Strouss: That was just one accident, however, two casualties in one accident.

A. Yes, two casualties in one accident at Yuma on October 21, 1937.

The Court: Was that coming into the Yuma yards from California?

A. Yes, sir.

Q. It was not a long-train operation between Yuma and Tucson?

A. It was not.

Mr. Strouss: Your exhibit doesn't show the number of short trains and number of long trains operated over the period, does it, Mr. Sullivan?

A. No, it does not.

The Court: Well, Mr. Sullivan, from your study of casualties, is there a higher or lower percentage on the main line or on the branch lines, or are they kept separately?

A. They are not kept separately, but that can be determined by an examination of exhibits 274 and 275, which gives the location.

The Court: I might state my purpose in asking that question. Your total mileage in the two states on main [fol. 3720] lines are very closely the same, but if you include your branch lines, then the total mileage in the state of Arizona is a fourth more than it is in the state of Nevada, and I was just wondering whether proportionately there was a larger or lesser percentage of accidents, casualties, on your branch lines than on your main lines?

A. Well, on account of the extent of operation, there is bound to be a considerably fewer casualties on branch lines.

The Court: Based on train-miles or car-miles, either way you want to put it?

A. On any basis, that is true. Attempting to relate casualties to road mileage would be an imperfect basis of comparison. Frequently, on a branch line the service might be mixed train service or it could be local freight service. In any case, whether it is Arizona or Nevada, or branch line or main line, the statistics show that the casualties

are infrequent. Now, considering your branch line operation where possibly there might only be, well, 2500 train-miles in a month, if one casualty should occur on that branch and there had been no casualties over a period, on any basis of measurement the figure would be distorted because it is not truly representative of a big operation as repre- [fol. 3721] sented by the extensive train and car-miles shown on the exhibit; and it is not possible from the statistics that are reported to the Commissions to make a showing on branch or main lines. They are reported all in a lump as we would say, for the entire operation according to the class of service.

The Court: In other words, what you are stating is, in effect, advising the Court that the only fair basis is on a train-mile or on a car-mile basis rather than the track mileage?

A. That is correct, and I have never seen any statistics or anyone attempt to relate the occurrence of either accidents or casualties to road mileage without some reference to the basic statistics, either locomotive-miles, train-miles, car-miles, or, as is used for all classes of accidents, the man-hours.

The Court: Well, of course, that would be true when you came to a percentage proposition as shown, for instance, on exhibit 280, in columns L to O inclusive, but if you went over into the columns as to the actual number of accidents, like columns F to K, inclusive, then in a state where you have twice the mileage, we will say, that you had in another [fol. 3722] state, you would expect, naturally, more accidents; assuming that the traffic was about the same, would you not?

A. You might have them in the aggregate, but that is the reason you level it off or flatten it by using a common basis of measurement to relate one to the other. I think it is elementary that if you would have twice as many train-miles in a state, regardless of the mileage over which it might have been operated, while it doesn't always hold that it would be so, you would expect twice as many casualties because there would be twice as many employees exposed to injury.

Mr. Mason: Mr. Sullivan, is it correct that the train-miles measure the opportunity of exposure to casualty?

A. Yes.

Q. And car-miles represent a measure of the traffic moved against which to measure casualties?

A. That is correct.

Q. And mileage of road operated considered apart——

Mr. Strouss: I think we are getting much too leading here.

Mr. Mason: I will reframe this question.

Q. Will you say whether or not mileage of road operated, [fol. 3723] independent of the traffic moved over it, affords a measure of opportunity for accident?

A. It does not afford a measure of opportunity. It merely provides, at best, a description of that portion of the line which may have accumulated a certain number of train-miles and car-miles.

Q. Now, referring particularly to Arizona and Nevada operations, will you say whether or not there is any substantial operation of trains of more than 70 cars on any of Nevada's branch lines?

A. There is no operation of trains of over seventy cars on Nevada branch lines.

Q. Is there on any of Arizona's branch lines any operation of trains approaching seventy cars in length?

A. Not that I know of.

Q. Are you particularly familiar with Nevada operations during the period to which your exhibits relate?

A. Yes, I am familiar with operations in Nevada.

Q. And to some extent with operations in Arizona, particularly the branch lines?

A. Yes.

Mr. Booth: Mr. Sullivan, have you prepared an exhibit showing fatalities, subsequent fatalities or amputation of [fol. 3724] limbs, road freight conductors, brakemen and flagmen, train and train-service accidents in Nevada and Arizona, during the period covered by the preceding exhibits?

A. I have.

Mr. Booth: We ask that this be marked defendant's Exhibit 281 for identification.

The Court: It may be marked.

The Clerk: Defendant's Exhibit No. 281 for identification.

Mr. Booth: Is this a particular listing of accidents which already appear in preceding exhibits?

A. Yes, they may be found by reference to exhibits 274 and 275 for the states of Nevada and Arizona.

Q. And identified by the dates in column A?

A. That is correct, or by the identity of the person shown in column H.

Q. Did any of these nine accidents and ten casualties that were not reported in Nevada result in a subsequent fatality or amputation of limb?

A. No.

Q. So this statement is based entirely on Form T reports of the Southern Pacific Company to the Interstate Commerce Commission?

[fol. 3725] A. That is correct.

Mr. Booth: Or reports of subsequent fatalities. Any questions, Mr. Strouss?

Mr. Strouss: No questions.

Mr. Booth: Your Honor?

The Court: No.

Mr. Booth: We offer this in evidence as defendant's Exhibit No. 281.

Mr. Strouss: Objected to as irrelevant and immaterial.

The Court: The objection is overruled. It may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 281.")

Mr. Booth: Have you prepared an exhibit, Mr. Sullivan, showing a comparison of the three years, 1923 to 1925, inclusive, with the three years, 1937 to 1939, inclusive, the operation of road freight trains in the State of Nevada.

A. I have.

Mr. Booth: We ask that this be marked No. 282 for identification.

The Court: It may be marked.

Mr. Booth: Will you describe this exhibit, please, and the sources from which you obtained it?

A. The source data is the same as I have invited attention [fol. 3726] to for the preceding exhibits. As to the casualties shown in columns F, G, H and I, and the total of them shown in column J, they are included in the Nevada figures, columns F, H and J, on exhibit 277 for the years 1923, 1924, and 1925, the earliest three years, and years 1937, 1938 and

1939; the latest three years. The statistical average of cars per train computed from dividing the train-miles into the freight train car-miles shows the average length of trains for those periods, which indicates that the period from 1923 to 1925 was a relatively short-train period of operation. The years 1937-1939 shows that it was a period of long-train operation. It therefore provides a comparison in exactly the same territory, which was the state of Nevada, of long train operation with a period of short train operation. The casualty rates have been computed on a locomotive-mile and freight train-mile, and the freight train car-mile basis, the figures in columns B, C, and D, having been abstracted from the annual reports of the Southern Pacific Company to the Nevada Public Service Commission for the years shown.

The Court: Which exhibit are you referring to, Mr. Sullivan?

[fol. 3727] A. Exhibit 282 for identification.

Mr. Booth: Is this exhibit true and correct, to the best of your knowledge and belief?

A. It is.

Mr. Booth: Any questions, Mr. Strouss?

Mr. Strouss: No questions.

Mr. Booth: Any questions, your Honor?

The Court: No.

Mr. Booth: We offer this exhibit in evidence as Defendant's Exhibit No. 282.

Mr. Strouss: Objected to as irrelevant and immaterial.

The Court: Objection overruled. It may be admitted.

(The document referred to was received in evidence and marked, "Defendant's Exhibit No. 282.")

The Court: The court will be at recess until two o'clock.

(Thereupon, the court stood at recess until February 6, 1941, at two o'clock P. M.)

[fol. 3728] 2 P. M., February 6, 1941.

All parties being present as heretofore noted, proceedings were resumed as follows:

The Court: You may proceed.

Mr. Booth: I will ask Mr. Mason to continue the examination, if the Court please.

The Court: There is no objection to that, I take it?

Mr. Strouss: No objection.

JOHN J. SULLIVAN resumed the witness stand.

Mr. Mason:

Q. Mr. Sullivan, referring back to your exhibit No. 282, I don't think any mention was made of these footnotes which appear below the block of figures. I will ask you if these footnotes are substantially the same as the narrative in connection with these accidents as it appears on your exhibit No. 275?

A. They are.

Q. Where do you get this figure shown with the plus sign, "includes 96 freight conductors, brakemen, and flagmen," is that by reference to exhibit No. 275 in the aggregation of figures shown thereon?

A. That is correct, likewise the minus sign.

[fol. 3729] Q. The "28 freight conductors, brakemen, and flagmen"?

A. That is correct.

Q. You speak of a ratio in the body of the exhibit. First of all, in column E, how do you obtain that ratio?

A. That ratio is obtained by dividing train length of the last period, the three years 1937 to 1939, by the figure representing the average train length for the earlier period, 1923 to 1925.

Q. Then, this is a ratio of the larger figure to the smaller and not of the earlier figure to the later?

A. That is right.

Q. When you come to columns K, L, and M, are those the ratio of the larger figure to the smaller?

A. That is right.

Q. And not of the later period to the earlier?

A. That is correct.

Q. Will you say whether or not these ratios should be read as counterbalancing each other rather than side by side?

A. They should be read independently for each column.

Q. I mean the ratio, for example, in column E and the [fol. 3730] ratio in column K, one of those is a ratio of the later period against an earlier, and the other is a ratio of the earlier period against a later, isn't it?

A. Possibly I had better explain what the figure represents. The train length in the later period, 1937-1939, was 1.48 longer than during the short train period, almost one and a half greater. The casualty rate for the earlier or short train period, based on locomotive-miles, was 2.82 times as great as it was in the long train period of 1937-1939; and the train-mile casualty rate for the early short train period was 2.88 times the casualty rate of the long train period; and on a freight-car-mile basis the casualty rate was 4.27 higher or greater in the short train period than it was in the long train period. In other words, there were 4.27 times as many casualties in the short train period, measured on a car-mile basis, than there were in the long train period of 1937-1939.

Q. Are these averages of cars per train inclusive or exclusive of caboose?

A. They are inclusive of caboose.

Q. If I understand you correctly, and I am undertaking to summarize for my own information, you show by column E that trains in the earlier period were two-thirds as long, [fol. 3731] on the average, and by column M that accidents were four times as frequent in proportion to car-miles, is that correct?

A. That is correct.

Q. Will you take up a statement in two sheets entitled, "Casualties to All Classes of Employes Off Duty, Road Freight Train Operation, Sustained in Train and Train Service Accidents Reportable to the Interstate Commerce Commission, Years 1923 to 1939, Inclusive, State of Arizona"?

A. That is correct.

Q. Was this exhibit prepared by you?

A. It was.

Mr. Mason: May we have this marked "Defendant's Exhibit No. 283" for identification?

The Court: It may be marked.

The Clerk: Defendant's exhibit No. 283 for identification.

Mr. Mason:

Q. I take it you have already explained the source showing of freight train miles and freight train car-miles and that that source is the same as on preceding exhibits where these figures are shown?

A. That is correct.

Q. What is the source of the casualty showing?

[fol. 3732] A. The same source as the casualty figures in the preceding exhibits, the certified copies of the photostatic copies, form T, made by the Southern Pacific Company for the Interstate Commerce Commission for the years 1923 to 1935, inclusive, and for 1936 to 1939 true carbon copies of the original form T's made by the Southern Pacific Company to the Interstate Commerce Commission.

Q. You show in column J of the first sheet of the exhibit the grand total of all the casualties to which the exhibit relates. Do you show the detail of those casualties on sheet No. 2?

A. I have.

Q. Is the showing on sheet No. 2 a correct excerpt of what appears on the individual form T's covering these particular occurrences?

A. It is.

Q. I take it that the calculations are your own calculations on the face of the exhibit?

A. That is correct.

Q. And are capable of check?

A. Yes, sir.

Q. Will you say whether or not the computations on the exhibit are true and correct?

A. They are.

Q. I will ask you if these casualties indicated on exhibit [fol. 3733] No. 283 for identification are those incident to freight train operation in Arizona sustained by employees but in addition to those which are shown on exhibit No. 274?

A. They are in addition, the ones shown on No. 274 only include employees on duty.

Q. And in this exhibit you undertake to show those to employees not on duty but still classed as employees?

A. That is correct?

Mr. Mason: Have you any questions, Mr. Strouss?

Mr. Strouss: No.

Mr. Mason: Has your Honor any questions?

The Court: No.

Mr. Mason: We offer the exhibit in evidence as defendant's exhibit No. 283.

Mr. Strouss: No objection.

The Court: It may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 283.")

[fol. 3734] The Court: Well, these casualties were reported to the Interstate Commerce Commission?

A. They were.

Q. The regulations so require?

A. It requires the reporting of injuries to all persons regardless of their classification or occupation, but it requires by a symbol to indicate on the report whether the employee is on duty or if it is an employee off duty; so I prepared the exhibits on the same basis that is followed by the Interstate Commerce Commission, employees on duty and employees off duty.

The Court: Now, Mr. Sullivan, an employee of the Southern Pacific who was not engaged in any duties for the railroad, he would not be classed or would not be listed under this exhibit here; what I am getting at is, suppose that after working hours he suffers an injury like any other individual might, the company doesn't keep any record of that?

A. If he was injured through the operation of a train, and depending on the circumstances, he would be classified as a trespasser if he had no right to be where he was; he would be classified as a non-trespasser if he had a right to be where he was when struck. If a conductor of the Southern Pacific Company off duty was crossing a street cross-[fol. 3735] ing, where he had a right to be, and was struck by a train, car, or locomotive, the injury would be reported under the rules of the Commission on form T and he would be classified as a non-trespasser; but every injury, every fatality, resulting, must be reported even though the person injured may have been a trespasser.

Mr. Mason: I think what his Honor had in mind was whether all injuries to employees off duty were reported, and I think you made it clear. I will ask you if you have undertaken to show here only those injuries incident to the operation of freight trains on the railroad? You wouldn't report an injury to an employee suffered in an automobile accident far from the right-of-way, would you?

A. No. I might explain by a detail. Item 3, sheet 2 of exhibit 283 shows an injury to Conductor W. W. Pettis. He had just completed his trip, he was off duty and his pay

had stopped, but while crossing over between trains on the way to the office, considering the conditions under which he had to cross, he had a lawful right to be there, and while crossing between the cars his hands slipped and he fell. The rules of the Commission require in cases of that [fol. 3736] kind that the injury be reported as an employee off duty rather than as a trespasser or as a non-trespasser.

Mr. Mason: Has your Honor any further questions?

The Court: No, no further questions.

Mr. Mason: Will you take up next, Mr. Sullivan, a statement in two sheets bearing the title, "Casualties to All Classes of Employes off Duty, Road Freight Train Operation, Sustained in Train and Train Service Accidents, Reportable to the Interstate Commerce Commission, Years 1923 to 1939, Inclusive, State of Nevada?"

A. I have prepared such an exhibit.

Mr. Mason: May we have this marked as No. 284 for identification.

The Court: It may be marked for identification.

The Clerk: Defendant's Exhibit No. 284 for identification.

Mr. Mason: From what sources was this exhibit prepared, Mr. Sullivan?

A. From the same sources as the preceding exhibits, photostatic copies, certified photostatic copies of form T's for the year 1923 to 1935, inclusive, and true carbon copies of the office copies of the original form T's made by the Company to the Interstate Commerce Commission.

[fol. 3737] Q. Now, does this exhibit relating to Nevada include any accidents reportable to the Interstate Commerce Commission but which for any reasons were not so reported?

A. It does not.

Q. Will you say whether or not the showing on this exhibit is similar in form to that made on Exhibit 283?

A. It is. It is a companion exhibit.

Q. In column J you show a grand total of all casualties. Do you show the details of such casualties on sheet No. 2?

A. Yes.

Q. Are these details a true and correct representation of what is set forth on the form T reports?

A. They are.

Mr. Mason: Have you any questions, Mr. Strouss?
Mr. Strouss: No.
Mr. Mason: Your Honor?
The Court: No.

Mr. Mason: Is the exhibit true and correct in so far as it concerns computations, Mr. Sullivan?
A. It is.

Mr. Mason: We offer the exhibit in evidence as No. 284.
[fol. 3738] Mr. Strouss: Objected to as irrelevant and immaterial.
The Court: The objection is overruled. It may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 284.")

Mr. Mason: Mr. Sullivan, will you please take up a statement in a single sheet entitled, "Casualties to persons Carried Under Contract (Livestock Caretakers, Banana Messengers, etc.), Road Freight Trains, Sustained in Train and Train Service Accidents, Reportable to the Interstate Commerce Commission, for the Years 1923 to 1939, Inclusive, Southern Pacific Company in States of Nevada and Arizona." Have you that statement before you?
A. I have.

Mr. Mason: Your Honor, may this be marked No. 285 for identification?
The Court: It may be marked.
The Clerk: Defendant's Exhibit No. 285 for identification.

Mr. Mason: Did you prepare No. 285, Mr. Sullivan?
A. I did.
[fol. 3739] Q. Will you state the sources?
A. The sources are the same as for the preceding exhibits, the photostatic certified copies of the form T reports for the State of Arizona and the State of Nevada for the years 1923 to 1935, inclusive, and true carbon copies of the office copies of the original form T's made by the company to the Interstate Commerce Commission.
Q. Have you examined the counterpart copies of the form T's since and including the year 1936 for any casualties of the type indicated by the exhibit?
A. Yes.

Q. Will you say whether or not there were any casualties of that type in either state since the first of January, 1936, to and including the end of 1939?

A. The only casualties reportable are the ones shown on exhibit 285 for the State of Nevada and the State of Arizona. There have been no accidents of that type in Nevada since 1925 or in Arizona since 1934.

Q. Will you say whether or not the showing upon the exhibit is a true and correct representation of what appears in the original documents to which you have referred?

A. It is.

[fol. 3740] The Court: Do I understand that it is customary for the railroads, for instance, with a livestock shipper to permit him to send one man along to care for the cattle and that you haul him free and return him to his point of embarkment, that is where he left from?

A. That is true; there are one or more caretakers that may travel with the stock, depending upon the number of carloads in the shipment, the number being regulated by rule and tariff; and it is optional with the shipper whether he will have a caretaker or not. Upon his arrival at destination he is returned to his point of origin if he desires to return there.

Q. And this exhibit would cover injuries to such people?

A. It will while on the freight train, and if the livestock caretaker returning after accompanying a shipment of stock is traveling on a passenger train and should be injured, he would be classified as a passenger and not as a person traveling under contract.

Q. He is really a non-revenue passenger?

A. That is right.

Mr. Mason: There was even some dispute as to that, your Honor, because perhaps the money for his transporta-
[fol. 3741] tion is part of the money for the transportation of the livestock.

Q. Now, Mr. Sullivan, I take it that exhibit 285 for identification relates to only those casualties which may have been suffered by persons such as livestock caretakers while riding on freight trains within these two states?

A. That is correct.

Q. Is the classification shown in the title "Persons Carried Under Contract" a classification employed by the

Interstate Commerce Commission in its rules relating to the reporting of railway accidents?

A. It is.

Q. Do they prescribe therein which classes or subclasses of persons shall be regarded as carried under contract?

A. Yes, all persons who have a legal right to be on the train, but who are not employees, are classified by the Interstate Commerce Commission as persons carried under contract. That applies not only to freight trains, but to certain classes of individuals who travel on passenger trains.

Q. As applied to freight trains, who are the principal classes of persons carried under contract?

A. Livestock caretakers, banana messengers, attendants [fol. 3742] in charge of emigrant movables.

Q. Messengers in charge of live poultry cars?

A. Messengers in charge of live poultry; in some cases representatives of fruit-growing associations, who are permitted to ride to accompany test shipments of perishable freight, well, depending upon conditions. The field is somewhat large.

Mr. Booth: Mr. Sullivan, a trainman's term for a caretaker in charge of emigrant moveables is "Zulu," isn't it?

A. I think that is the term generally used.

Mr. Mason: Any questions on the exhibit, Mr. Strouss?

Mr. Strouss: No.

Mr. Mason: Has your Honor any questions?

The Court: No.

Mr. Mason: We offer the exhibit in evidence as Defendant's Exhibit No. 285.

Mr. Strouss: I object to the part relating to Nevada as irrelevant and immaterial.

The Court: The objection will be overruled. It may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 285.")

Mr. Mason: Mr. Sullivan, in connection with persons [fol. 3743] carried under contract on freight trains, what is the extent, the minimum extent of the disability which renders an accident reportable?

A. Any disability beyond one day.

Q. Do the rules require the reporting of all accidents even though not necessarily directly connected with the operation of the train?

A. Yes, if the injury is sustained in connection with the operation of the train.

Q. I notice here you have one accident in the State of Arizona, item No. 4, where a livestock caretaker was kicked by a steer while inside of the car?

A. Well, that is reportable under the rules, the accident occurred while the individual was on the freight train.

The Court: If the steer had kicked him while loading him, you wouldn't have reported it?

A. If it was on the company premises, that would be reported as a non-train accident to a non-trespasser.

Mr. Mason: Mr. Sullivan, I will ask you to take up next, if you will, please, a statement in one sheet bearing the title "Derailments Caused by Defects in or Failures of Freight Car Equipment, Road Freight Trains, Including [fol. 3744] Mixed, Reportable to the Interstate Commerce Commission, Years 1923 to 1939, Inclusive, State of Arizona." Is that before you?

A. Yes, sir.

Mr. Mason: May we have the statement marked Defendant's Exhibit No. 286 for identification.

The Court: It may be marked.

The Clerk: Defendant's Exhibit No. 286 for identification.

[fol. 3745] Mr. Mason:

Q. Did you prepare this exhibit or cause it to be prepared?

A. I prepared the exhibit.

Q. I take it as to columns A, B, and C the sources are as previously explained by you?

A. That is correct.

Q. From what sources did you draw the information in columns D and E?

A. From the form T reports, the same sources as the reports that casualties are made to the Interstate Commerce Commission.

Q. Do the form T reports show in connection with the

accidents causing damage to equipment the amount of the damage to equipment?

A. It does.

Q. I will ask you whether or not the accidents shown here are largely or entirely of the class known as "train accidents"?

A. They are the train accidents, that type of accident involving damage to equipment, track, and structures, including the cost of clearing wrecks exceeding $150 for each accident.

Q. Here I take it you have included only that particular class of train accidents which may be referred to as "derailments"?

A. That is right, that is one of the primary classifications [fol. 3746] by the Interstate Commerce Commission.

Q. Does your form T report show again whether a derailment is due to a defect in or failure of equipment as contrasted with defect in or failure of the roadbed or track structures?

A. Item 17 and item 26 on form T require that a narrative description of the cause be given and the Interstate Commerce Commission Class No. 8 indicates also that it is due to a certain cause, different symbols being required for derailments due to defects or failures of equipment or from other causes.

Q. I take it this is confined not only to a particular class of train accident known as "derailment" but to those which are caused by defect in or failure of equipment?

A. Freight car equipment, yes.

Q. This does not include any defect in or failure of the locomotive?

A. It does not.

Q. Or of the track?

A. It does not.

Q. Or any derailment which may have been due to failure or negligence of employees?

A. Not as classified by the Interstate Commerce Com- [fol. 3747] mission, but negligence could be involved but nevertheless it is classified by the Interstate Commerce Commission as a defect or failure of the equipment.

Q. When I speak of negligence of employees, if there were a derailment due to excessive speed or failure to close a derail, that wouldn't be shown here?

A. It would not.

The Court: Does some part of the train actually have to leave the rails to constitute a derailment?

A. Yes, sir.

Q. Even if only one car on the train was derailed, it would constitute a derailment?

A. That is correct, or if even one wheel of the car was derailed that would classify it as a derailment.

Q. This exhibit merely purports to show those derailments which were caused by defective freight car equipment?

A. Or failure of some part of the equipment which might not have been defective, that is correct.

Mr. Mason:

Q. Mr. Sullivan, I notice in the title beside the words, [fol. 3748] "Description or Nature of Defect or Failure," you have also the words, "And I. C. C. Cause Code Numbers." You explained yesterday the system of code number used by the Interstate Commerce Commission in its accident bulletins relating to particular classes of train-service accidents. Does the Commission use code numbers with relation to the causes and classification of causes of train accidents as well?

A. It does.

Q. Are you using those same numbers here for the purposes of this exhibit?

A. I have. I have shown the code causes so that in case anyone desired to analyze the exhibit they could determine what kind of defect is reportable under the various heads.

Q. Referring to column D and to line 3, how do you arrive at the figure in column D?

A. I tabulated the number of accidents classified as derailments involving freight car equipment that occurred in the state of Arizona for the year 1925. The aggregate of that particular class was nine and opposite was shown the total damage in those nine accidents.

Q. This particularly refers to failures of trucks. Did you add up the number of truck failures to get the nine? [fol. 3749] A. Yes, and the related causes, trucks and arch-bars and parts of the trucks and arch-bars.

Q. How did you get the figure in column E, line 3, is that by addition of the separate figures appearing on the several form T reports?

A. That is correct.

Q. Corresponding to the nine numbers?

A. That is right.

Q. Did you follow the same process as to the figures in each column and in each line other than those which appear to be totaled?

A. I did.

Q. Going over to columns R and S, are those the addition of what appears in the preceding columns?

A. It is.

Q. The computations in column T and U, are those simply rates?

A. They are calculated rates, in relating the total number of accidents shown in column R against the freight train miles shown in column B for the result shown in column T and against the freight train car-miles in column C for the rate that is shown in column U.

The Court: Mr. Sullivan, it appears from this exhibit [fol. 3750] there are 105 accidents or derailments, I take it, caused by the defects or failures in equipment. Does it necessarily follow there were any casualties in connection with these derailments?

A. The footnote will indicate the only reportable casualties by an index figure, the letter "(a)" in column D on line 3 indicates that in one of those accidents an engineer was killed; on line 5 in column L, one accident in which a telegraph lineman was killed. There were no other casualties in those 105 reportable derailments.

Mr. Mason:

Q. The only casualties were these two fatalities and there were no personal injuries involved in these derailments?

A. That is correct.

Q. Will you say whether or not the exhibit is true and correct as reflecting the underlying sources?

A. It is.

Q. Have the computations been checked?

A. They have.

Q. Are they true and correct?

A. They are.

Q. One other question as to the face of the exhibit, you show in line 22 certain rates, are those the calculations of [fol. 3751] the number of accidents for the entire period

related to the total number of car-miles for the entire period?

A. They are.

Q. And are capable of check against the figures in line 21?

A. They are. The accident rate based on one hundred million car-miles figured on car-miles because the defect in every case is associated with an individual car rather than the train.

Mr. Mason: Have you any questions, Mr. Strouss?

Mr. Strouss: No questions.

Mr. Mason: Has your Honor any questions?

The Court: No.

Mr. Mason: We offer the exhibit in evidence as defendant's exhibit No. 286.

Mr. Strouss: No objection.

The Court: It may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 286.")

Mr. Mason:

Q. Will you please refer to a statement in a single sheet bearing a title similar to that on exhibit No. 286 but relating to the state of Nevada. Have you that exhibit before you?

A. I have.

Mr. Mason: May this statement be marked as "Defend-
[fol. 3752] ant's Exhibit No. 287"?

The Court: It may be marked.

The Clerk: Defendant's exhibit No. 287 for identification.

Mr. Mason:

Q. Will you state whether this exhibit was prepared in the same manner and along the same lines as exhibit No. 286?

A. Exactly in the same manner as the preceding exhibit.

Q. And the rates have been calculated and are placed in corresponding lines and columns, have they?

A. They have. There is a difference; I want to call attention to the block at the foot of the exhibit that does not appear on the exhibit No. 286.

Q. I was going to ask you about that. Have you undertaken by the block bearing the identification, "Summary of Derailments Shown Above," to classify the accidents by

the type or character and the portion of the equipment which failed and by train length as between 70 cars and less and over 70 cars?

A. I have.

Q. Has the exhibit been compared against the underlying sources?

[fol. 3753] A. It has.

Q. Have the computations been checked?

A. They have.

Q. Will you say whether or not it is true and correct?

A. It is.

Q. Do I understand that you are likewise showing here the casualties by way of death or injury which may have been incurred by employees in connection with these derailments?

A. I have, by reference to line 16 in column F an index letter "(a)" is shown which indicates that one of the trainmen was injured in one of the accidents shown.

Q. You also show a reference in 1934, line 13, to "(b)"?

A. That indicates that in that accident two trainmen were injured.

Q. I will ask you whether these casualties shown on exhibit No. 286 just received and also on No. 287 for identification are included in the lists of personal injuries to train and enginemen in the states of Nevada and Arizona which have been received as exhibits Nos. 274 and 275?

A. I will have to check, but my recollection is that the engineer who was killed was not on a road freight train [fol. 3754] but was on another train and was killed when the derailment occurred.

Mr. Mason: Have you any questions on exhibit No. 287, Mr. Strouss?

Mr. Strouss: This also includes cost of clearing wrecks, does it, Mr. Sullivan?

A. It does, yes. I didn't complete my answer. On item (b) the telegraph lineman killed is shown as item 190 on sheet No. 5 of exhibit No. 274. I have a footnote, Mr. Strouss, at the bottom of exhibit No. 286 which indicates what is included in the term "damage." Damage includes "damage to equipment, track and structures, and cost of clearing wrecks."

Mr. Strouss: But it would only include cost of clearing wrecks where the wreck was caused by derailment as a result of defect or failure in freight car equipment?

A. Yes, only the accidents that are included in this particular exhibit.

Mr. Mason: We offer exhibit No. 287 in evidence.

Mr. Strouss: Same objection.

The Court: Objection overruled, it may be admitted.

(The document referred to was received in evidence and [fol. 3755] marked "Defendant's Exhibit No. 287.")

Mr. Mason:

Q. Mr. Sullivan, I will ask you to refer, if you will, to sheet No. 6 of exhibit No. 275 and to item 218. Is that the same accident which is referred to by your footnote "(a)" on your exhibit No. 287?

A. Yes, that is the one.

Q. Will you refer to item 224 on sheet No. 6 of exhibit No. 275. Is that the same accident which is referred to in footnote "(b)" on exhibit No. 287?

A. That is the accident.

Q. Have you before you a statement in one sheet entitled "Comparison of the Total Derailments Caused by Defects in or Failure of Freight Car Equipment Shown in Exhibit No. — for State of Nevada, and Exhibit No. — for State of Arizona, Years 1923 to 1939, Inclusive"?

A. I have.

Q. I take it that these blanks should be filled in by reference to preceding exhibits. Will you indicate the numbers?

A. The first blank on the second line of the title should show exhibit No. 287 for the state of Nevada and exhibit No. 286 for the state of Arizona.

[fol. 3756] Mr. Mason: May we have the statement just referred to marked for identification as "Exhibit No. 288"?

The Court: It may be marked.

The Clerk: Defendant's Exhibit No. 288 for identification.

Mr. Mason:

Q. Will you say whether exhibit No. 288 is a compilation of the information appearing on the last two exhibits, Nos. 286 and 287?

A. It is. The block at the foot of the exhibit indicates where the figures in the various columns have been obtained.

Q. I take it this is simply a gathering together in one

place of the information shown in separate columns on the preceding exhibits?

A. That is correct.

Q. Are there any additional computations on this exhibit?

A. Yes.

Q. Will you indicate in which columns they appear?

A. In columns L and M and P and Q the total damage on account of the derailment shown on the exhibits referred to has been related to a million train mile basis and one hundred million car mile basis, respectively, so that the com-
[fol. 3757] plete showing will show in corresponding columns the accident rate and the damage per accident rate on a train mile and on a car-mile basis.

Q. In line 7 you show certain averages under the rate columns, J to M and N to Q, inclusive. Are those averages of the total money, total train-miles, and total car-miles over the period?

A. They are.

Q. So that this is not an average of averages but an actual over-all average rate?

A. It is an actual over-all average rate.

Q. Would the same be true as to lines 14 and 20?

A. Exactly.

Q. And line 21?

A. Yes, sir.

Q. Have these computations been checked?

A. They have.

Q. Will you say whether or not the exhibit is true and correct insofar as it reflects the underlying sources or the computations to which you have referred?

A. It is.

Mr. Mason: Have you any questions, Mr. Strouss?

Mr. Strouss: No questions.

[fol. 3758] Mr. Mason: We offer the exhibit in evidence as defendant's exhibit No. 288.

Mr. Strouss: The same objection.

The Court: It may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 288.")

Mr. Mason:

Q. Mr. Sullivan, I will ask you to take up a statement in twelve sheets entitled, "Detail of Train Accidents, Road

Freight Train Operation Reported to the Interstate Commerce Commission, Years 1923 to 1935, Inclusive, State of Arizona."

A. I would like to request that that title be corrected, where it shows the years "1923 to 1935" it should be "1923 to 1939."

Mr. Mason: May we have the title read in the last line, "Years 1923 to 1939, Inclusive"?

The Court: It may be corrected.

Mr. Mason: May we have this statement marked for identification as "Defendant's Exhibit No. 289"?

The Court: It may be marked.

The Clerk: Defendant's exhibit No. 289 for identification.

Mr. Mason:

Q. Mr. Sullivan, did you prepare this exhibit?

A. I assisted in its preparation and checked the entire [fol. 3759] exhibit.

Q. Was it prepared under your direction and supervision?

A. It was.

Q. From what sources?

A. From the four T reports, the same sources as the preceding exhibits.

Q. Was this exhibit prepared in the same manner as exhibit No. 274?

A. It has gone further than No. 274. This is a detail of all train accidents and No. 274 includes some injuries that are included in No. 289 for identification.

Q. I understand that, but my question was, was it prepared in the same manner as exhibit No. 274?

A. Yes.

Q. I understand that the difference between the two exhibits is that exhibit No. 289 for identification relates to train accidents in road freight train operation whereas exhibit No. 274 relates to casualties to employees on duty sustained in either train or train-service accidents?

A. That is correct.

Q. Would it follow then, Mr. Sullivan, there is some duplication as between the exhibits?

A. As to the personal injuries, yes.

[fol. 3760] Q. Where there were personal injuries involved in train accidents, that accident will be shown in exhibit No. 274, will it?

A. If it was an employee on duty.

Q. And would, of course, also be shown in exhibit No. 289 if that exhibit is correct?

A. That is true.

The Court: But there might be a train accident reported on this exhibit No. 289 without any resulting casualty?

A. That is correct. In fact practically all of them are of that type.

Mr. Mason:

Q. Will the accidents shown on exhibit No. 289 for identification, if they were derailments resulting from defects in or failures of car equipment, be included in the showing on exhibits Nos. 286 and 288?

A. They will.

Q. I take it this is simply a presentation of the train accidents by detail and in sequence?

A. For road freight train operation, that is correct.

Q. Will you say whether or not the information shown hereon corresponds to that which appears on the original sources, the form T reports to which you referred?

[fol. 3761] A. It does.

Q. Has the exhibit been carefully checked for that purpose?

A. It has.

Q. Are there any computations or calculations of your own in connection with the exhibit?

A. No.

Mr. Mason: Have you any questions, Mr. Strouss?

Mr. Strouss: No questions.

Mr. Mason: Has your Honor any questions?

The Court: No questions.

Mr. Mason: We offer the exhibit in evidence as defendant's exhibit No. 289.

Mr. Strouss: No objection.

The Court: It may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 289.")

The Court: For an accident to have been reported and to appear on this exhibit No. 289, there must have been damage in excess of $150?

A. That is correct.

Mr. Mason:

Q. Do you undertake by this exhibit to show all reportable train accidents whether accompanied by casualties or not which occurred in road freight train operation during the [fol. 3762] period referred to?

A. I have, that is correct. That includes derailments, collisions, locomotive accidents, and miscellaneous train accidents.

Q. Have you any other comment on the exhibit, Mr. Sullivan?

A. No.

Q. Will you take up a statement in nine sheets bearing the title, "Detail of Train Accidents, Road Freight Train Operation, Reported to the Interstate Commerce Commission, Years 1923 to 1939, Inclusive, State of Nevada"?

A. I have the exhibit.

Mr. Mason: May we have this statement marked "Defendant's Exhibit No. 290" for identification?

The Court: It may be marked.

The Clerk: Defendant's exhibit No. 290 for identification.

Mr. Mason:

Q. Did you prepare exhibit No. 290, Mr. Sullivan?

A. I did.

Q. From the form T reports or the certified copies thereof or retained copies thereof as you have previously mentioned?

A. Yes, sir.

Q. Will you say whether or not this exhibit No. 290 cor- [fol. 3763] responds to exhibit No. 289 except that it relates to the state of Nevada?

A. It does.

Q. Is it a true and correct representation of the information appearing upon the underlying documents?

A. It is.

Mr. Mason: Have you any questions, Mr. Strouss?

Mr. Strouss: No questions.

Mr. Mason: Has your Honor any questions on the exhibit?

The Court: No questions.

Mr. Mason: We offer the exhibit in evidence as defendant's exhibit No. 290.

Mr. Strouss: The same objection as to the previous exhibits on the state of Nevada.

The Court: Objection overruled, it may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 290.")

Mr. Mason: May we take our recess at this time, your Honor?

The Court: Yes, we will take our recess now.

(Thereupon a short recess was taken after which proceedings were resumed as follows.)

[fol. 3764] The Court: You may proceed.

Mr. Mason: Mr. Sullivan, I will ask you to refer, please, to a statement in four sheets entitled "Casualties to All Classes of Persons, Except Trespassers, Sustained in Train and Train Service Accidents While On, Employed On, or Getting On or Off Passenger Trains, Reportable to the Interstate Commerce Commission, Years 1923 to 1939, Inclusive; Southern Pacific Company Lines in State of Nevada." Have you that statement before you?

A. I have.

Mr. Mason: May we have the statement marked Exhibit No. 291 for identification?

The Court: It may be marked.

The Clerk: Defendant's Exhibit No. 291 for identification.

Mr. Mason: Mr. Sullivan, as I look at the exhibit, the first sheet is a summary sheet of details which are shown on the succeeding sheets, is that correct?

A. That is correct.

Q. And the first sheet also contains certain calculations predicated upon the statistics which appear on the first sheet, is that right?

A. That is correct.

[fol. 3765] Q. Now, will you state from what sources you obtained the figures shown in columns B, C, and D?

A. The basic figures in column B represented the number of revenue passengers carried, column C, revenue passengers one mile in thousands, and passenger train-miles in thousands were abstracted from the annual report of the

Southern Pacific Company to the Nevada Public Service Commission.

Q. Are those directly copies from those annual reports for those several years which are referred to on the exhibit?

A. Yes, sir.

Q. Now, I take it that the figures shown in columns E to P inclusive, are the aggregation of the figures representing the individual accidents shown on the succeeding sheets?

A. That is correct.

Q. As to columns Q and R, what are those?

A. They are the total of the preceding columns of the killed and injured, respectively.

Q. Now, in columns S, T, and U, have you calculated the casualty rate for the passengers separately?

A. I have.

Q. And in column V, the casualty rate for employees on the train-mile basis?

[fol. 3766] A. I have.

Q. And in column W, to persons other than passengers or employees classed as non-trespassers.

A. I have.

Q. And finally the casualty rate for all persons in column X?

A. I have.

Q. Are these calculations true and correct?

A. They are.

Q. And are the figures upon which the calculations are predicated likewise true and correct?

A. They are.

Q. Now, going to sheet 2, I will ask you whether the explanation of sheets 2, 3 and 4, is similar? What do you undertake to show on these sheets?

A. They are the details abstracted from the Form T reports of the Southern Pacific to the Interstate Commerce Commission.

Q. And are these a correct summary of the details as they appear upon the form T reports?

A. They are.

Q. Are there any of the accidents which are referred to on Exhibit No. 291 for identification which were reportable but not reported?

A. No.

[fol. 3767] Q. Did you make an examination to determine whether there were any accidents involving passenger trains that might not have been reported although reportable?

A. I made such an investigation, and found none.

The Court: I see one of these accidents was caused by a dog biting the baggageman.

Mr. Mason: Mr. Sullivan, is an accident of that kind nevertheless reportable, if it occurs during the operation of the passenger train?

A. Yes, it is reportable.

Mr. Mason: Have you any questions on the exhibit, Mr. Strouss?

Mr. Strouss: No questions.

Mr. Mason: Your Honor? We offer the exhibit in evidence as Exhibit No. 291.

Mr. Strouss: The same objection.

The Court: The objection is overruled. It may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 291.")

Mr. Mason: Now, Mr. Sullivan, is there any detail of the operation or any detail of the showing, rather, as it relates to the year 1939 which deserves particular mention other [fol. 3768] than mention which has been made on the exhibit

A. Yes. I would like to invite attention to sheet 4, item 51, wherein reference is made to a derailment of No. 101, which is a streamliner consisting of fourteen cars, in which a number of passengers and employees were killed and injured, which was due to malicious tampering with the track, and has a tendency to otherwise distort a statistical showing of this kind, which is readily apparent when reference is made to the casualty rates for the year 1939 as well as the five-year period shown on line 20 for the years 1935 to 1939.

The Court: Were the parties responsible for this ever apprehended and prosecuted?

A. No, sir.

Mr. Mason: Do you know and, if so, will you state, Mr. Sullivan, whether efforts are still being continued to run

down the person or persons responsible for the Harney wreck?

A. Yes, I know of my own knowledge that such effort is being made.

Q. Is there a substantial reward offered by the company for their apprehension?

A. Yes, sir.

Q. Do you know how much?

[fol. 3769] A. I don't recall; it seems to me it is $10,000. And I may state that while the cause is given in column 1, train derailment due to malicious tampering with the track, that was an accident investigated by the Bureau of Safety of the Interstate Commerce Commission, and that was the cause assigned by that body for the accident.

Q. You have reference now to the report of the investigation as published by the Interstate Commerce Commission?

A. Yes.

Q. Bureau of Safety?

A. And I have that report in a separate bound copy in my office across the street.

Q. Mr. Sullivan, you were assistant superintendent on the lines in Nevada for several years, were you not?

A. I was.

Q. You were inspector of transportation in the territory including the lines in Nevada for some time, too, were you not?

A. For a short time in 1920.

Q. Now, I would like to have you refer, if you will, please, to sheets 3 and 4 of your exhibit. I noticed that on sheet three, for example, the first item, No. 23, you refer to train [fol. 3770] No. 28. Do you remember the name designation of train No. 28?

A. The Overland Limited.

Q. And what is the name designation of train No. 21?

A. The Pacific Limited.

Q. Of train No. 9?

A. Fast Mail.

Q. Of No. 22 when that is shown in 1932?

A. I don't recall the designation, it seems to me that was known as the Reno Local.

Q. Now, going to sheet 4, you show a train designation there of No. 14.

A. Pacific Limited.

Q. No. 30, was that the Challenger or Advance Overland Limited?

A. I don't believe it had a designation, but it was operated as an advance overland limited, later changed to 88.

Q. Is No. 27 a companion to No. 28?

A. It is.

Q. You show also 87.

A. That is the Challenger.

Q. And finally 101, the train which was derailed at Harney?

A. That is known as the Streamliner City of San Francisco, a Diesel-operated train.

[fol. 3771] Q. Mr. Sullivan, during your experience as assistant superintendent on the Salt Lake division, will you say whether or not the operation of passenger trains of more than 14 cars was usual or unusual?

A. It was a common practice.

Q. Have you before you, Mr. Sullivan, a statement in ten sheets bearing the title on the first sheet, "Casualties to all Classes of Persons Except Trespassers Sustained in Train and Train Service Accidents While on, Employed on or Getting on or off Passenger Trains, Reportable to the Interstate Commerce Commission, Years 1923 to 1939, Inclusive, Southern Pacific Company Lines, State of Arizona."

A. I have that exhibit before me.

Mr. Mason: May we have the exhibit marked as No. 292 for identification?

The Court: It may be marked.

The Clerk: Defendant's Exhibit No. 292 for identification.

Mr. Mason: Did you prepare Exhibit 292, Mr. Sullivan?

A. I did.

Q. I take it, the sources are as shown in the footnotes on Sheet No. 1?

A. That is correct.

[fol. 3772] Q. Did you make the calculations of the rates indicated in columns S to X, inclusive?

A. I did.

Q. Will you state whether or not this exhibit has been prepared along the same lines and in substantially the

same form as to sheets 1 and 3 to 10, inclusive, as exhibit 291?

A. It has.

Q. Now, going to sheet No. 2—before we do that we will go to sheet No. 3. What do you undertake to show on sheets 3 to 10 inclusive?

A. Show a brief narrative, showing the date of the occurrence, the location, and other information that is shown on the carrier's form T of all accidents and personal injuries sustained by persons other than trespassers while on, employed on, or getting on or off pasenger trains in the state of Arizona.

Q. I take it, then, that sheets 3 to 10, inclusive, are a summary of the details of each of these accidents as such details appear in the form T reports?

A. That is correct.

Q. And you have simply shown them here in chronological order?

A. That is correct.

[fol. 3773] Q. By the way, I want to call your attention, Mr. Sullivan, to sheet 8. Will you refer to that sheet, and particularly to item 156. I take it that that accident is the one to be compared to the one where the person was bitten by a dog?

A. I think that is the one.

Q. Now, will you refer to sheet 2, Mr. Sullivan and explain what you have undertaken to do on that sheet?

A. As will be noted from Exhibit No. 291, casualty rates have been calculated relating to passengers, to employees, and to other passengers, and similar calculations on exactly the same basis on Exhibit 292 cover similar information for the State of Arizona. I have then on sheet 2 of Exhibit 292 made a comparison of the casualty rates for the same cycles of years, six years, 1923 to 1928, six years, 1929-1934, and five years, 1935 to 1939, as well as for the entire seventeen-year period, Arizona with Nevada, and then I have pointed out following an index reading "Ratio, Arizona Rates to Nevada Rates," to show the relationship of those rates to each other. In every case the casualty rate for all classes and for all periods is higher in Arizona than in Nevada except——

[fol. 3774] Mr. Strouss: Just a minute——

Mr. Mason: I don't think you should testify as to what the exhibit shows. You have made these computations, and

the computations, I take it, are explained by the wording on the face of the exhibit.

Q. Now, have you taken into account in the computations for the third block representing the period 1935 to 1939, inclusive, the casualties occurring in the Harney derailment?

A. They are included.

Q. Are they included, likewise, in the grand total?

A. They are.

Q. Have these computations been checked against the underlying sources?

A. They have.

Q. Has the exhibit itself been checked against the form T reports or other underlying sources to determine its correctness?

A. It has.

Q. Will you say whether or not it is true and correct?

A. It is.

Mr. Mason: We offer the exhibit in evidence as defendant's Exhibit No. 292.

[fol. 3775] Mr. Strouss: I object to the matter on page 2 relating to operations in Nevada as irrelevant and immaterial.

The Court: The objection is overruled. It may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 292.")

Mr. Mason: Now, Mr. Sullivan, I think that prior to the offer of the exhibit and its reception in evidence, you were about to comment upon the relationship between the casualty rates for the various classes of persons stated in Arizona and in Nevada, and the fact that the Arizona rates were higher or lower as the case might be. Will you continue with, or repeat that comment?

A. I called attention to the index identified as "Ratio, Arizona Rates to Nevada Rates," and in two instances "Ratio, Nevada Rates to Arizona Rates," in each of the four blocks; and I would like to invite attention that in every case except four, three of the items being in columns R, S, and T, in item No. 3 for the five years 1935-1939, and in column S, in item 4 for the 17-year period the casualty rate in Arizona is higher for every class than in Nevada,

the relationship one with the other being shown by the ratio [fol. 3776] figure in each column opposite the arrow.

Q. In each instance, as I read the exhibit, Mr. Sullivan, you have shown the ratio of the greater rate to the less rate however it might fall, have you?

A. That is right.

Q. Now, I would like to have you refer, if you will, to item 104 on sheet 6 of this exhibit. Do you know and, if so, will you state whether the accident referred to in item No. 104 was the subject of investigation by the Bureau of Safety of the Interstate Commerce Commission?

A. It was.

Q. And have you in the court room a copy, a printed copy of the published report of the Bureau of Safety?

A. I have.

Q. Will you identify it by its number and date, please?

A. The report appears at page 9 and continues to page 10 of the Interstate Commerce Commission Bureau of Safety Summary of Accident Investigation Reports No. 49, for the months of July, August, and September, 1931, the title page of the report bearing the seal of the Interstate Commerce Commission.

[fol. 3777] Q. This is a report, is it, bearing serial number 49, issued by the government printing office at Washington during the year 1932, according to the title page, is it?

A. That is correct.

Mr. Mason: Your Honor, I had intended to ask the witness to read from the report, but in order to save time and save the reporter, I will ask, with the consent of counsel and with your Honor's authority, that the reporter simply take the report and copy it into the record as if read.

Mr. Strouss: I have no objection to that. I would like to see it.

The Court: You say you have no objection, Mr. Strouss?

Mr. Strouss: No, I have no objection.

The Court: It may be copied in the record.

Mr. Mason: With the same effect as if the witness had read it?

The Court: Yes.

(The Summary of Accident Investigation Report referred to reads as follows:)

"Southern Pacific Co.

"Derailment of a passenger train near Dome, Ariz., on August 5, 1931, which resulted in the death of 2 employees and the injury of 12 passengers and 5 trespassers.

[fol. 3778] "This accident was caused by excessive speed on a sharp curve.

"In the vicinity of the point of accident this was a single-track line over which trains were operated by time-table, train orders, and an automatic block-signal system. The accident occurred near mile post 750 at a point approximately 3 miles west of Dome. Approaching this point from the west, the track was tangent, followed by a short curve to the left, a short tangent, and then a compound curve to the right 1,165 feet in length; this latter curve consisted of 270 feet of spiral, a 10 degree curve 456 feet in length, and then a six-degree curve for a distance of 289 feet, followed by 150 feet of spiral; the accident occurred on the six degree curve at a point 15 feet from its western end. The grade for eastbound trains was slightly ascending, being 0.04 per cent at the point of accident. On account of the rugged and mountainous country and the numerous sharp curves located on this section, the maximum speed for all trains in this vicinity was 30 miles per hour; the slow board at the western end of this restricted territory was located at a point 2.34 miles west of the point of accident.

[fol. 3779] "In the vicinity of the point of accident the track was on a fill 20 feet in height; it was laid with 130-pound rails, 39 feet in length, with 22 or 23 creosoted fir and gum ties to the rail length, fully tie-plated, double-spiked, and ballasted with crushed rock to a depth of 8 inches. The track was maintained in excellent condition.

"It was raining at the time of the accident, which occurred about 2:30 a. m.

"Eastbound passenger train first No. 104 consisted of two baggage cars and one coach, hauled by engine 3122. This train departed from Yuma at 1.55 a. m., according to the train sheet, 15 minutes late, and was approaching Dome when it was derailed while traveling at a speed estimated by a surviving member of the train crew to have been 30 miles per hour.

"Engine 3122 stopped on its left side down an embankment on the outside of the curve, with its head end 200 feet

beyond the initial point of derailment; it was badly damaged, with all the appurtenances torn off from the top as well as the left side of the engine. The tender also stopped on its left side behind the engine. The first car was headed down the embankment; the second car stopped on its right side to the right of the track and the last car stopped, leaning to the right at an angle of 45 degrees against [fol. 3780] the side of the cut. The employees killed were the engineman and fireman.

"The brakeman stated that before reaching the restricted-speed territory the train was traveling at a speed of 60 miles per hour and the conductor estimated the speed at 50 miles per hour. While neither of them was able to state that the brakes had been applied on passing through the restricted-speed territory until just prior to the derailment yet they did not think that the speed was excessive at the time of the accident. A thorough examination of the track and equipment, however, disclosed nothing that could have contributed to the cause of the accident. The only marks found on the track at the point of derailment were on the outside angle-bar bolts on the high rail, and on the ends of the ties leading down the embankment, indicating that the engine turned over from centrifugal force without first being derailed. This could have been accounted for only by excessive speed, which was consistent with the position in which the wreckage came to rest, and with the fact that the engine apparently landed on its back and then turned on its left side before coming to a stop [fol. 3781] down the embankment."

Mr. Strouss: That is not the complete report that was rendered, was it, Mr. Sullivan? This is just a summary of the report that is published here?

A. No, I don't understand that that is a summary report; I understand that that is the official report by the Bureau of Safety.

Q. Did I understand you to say you had a separate report from them?

A. On the Harney derailment.

Mr. Mason: Have you anything further on Exhibit No. 202, Mr. Sullivan?

A. Yes; on account of the reference having been made to the Harney derailment due to malicious tampering with

the track, I thought it only proper to call attention that a similar accident appears in Exhibit 292, that that particular type of accident wasn't associated entirely with Nevada.

Q. Will you state the item and the date sufficiently to identify the accident on Exhibit No. 292?

A. Item 21 on sheet 3 of Exhibit 292.

Q. How many fatalities were there in that?

A. A passenger fireman was killed, and a passenger engineer, and a passenger conductor, and five passengers [fol. 3782] were injured.

Q. Now, is that all that you had on 292, Mr. Sullivan?

A. That was all.

Q. Will you turn now to a statement in a single sheet entitled "Highway Grade Crossing Accidents in Which Automobiles Were involved, All Railroads, State of Arizona; Reflected by Statistics of the Interstate Commerce Commission and Those Which Occurred on Lines of Southern Pacific Company, Years 1923 to 1939, Inclusive?"

A. I have the exhibit.

Mr. Mason: May we have this marked "Defendant's Exhibit No. 293?

The Court: It may be marked.

The Clerk: Defendant's Exhibit No. 293 for identification.

Mr. Mason: Did you prepare Exhibit No. 293, Mr. Sullivan?

A. I did.

Q. Are the sources indicated on the exhibit?

A. They are.

Q. Now, I notice that for the year 1923, you indicate by a footnote reference that the column B, number of accidents not reported. Was the accident bulletin incomplete in that [fol. 3783] respect for the year 1923?

A. Yes, the accident bulletin didn't show until 1924 the number of accidents.

Q. Did it show the number of casualties?

A. It did.

Q. And also the number of automobiles registered by states?

A. It did.

Q. Now, these calculations "casualties for state per 10,000 automobiles registered." were they made by yourself?

A. No, the information shown in columns G and H also appear in the accident bulletins.

Q. And in column I?

A. It is a calculation by myself.

Q. Simply an addition?

A. That is right.

Q. Column J, where is that taken from?

A. Taken from the same bulletin, Summary No. 24.

Q. Now, for the lines identified as Southern Pacific only or "S. P. Only," from what source did you obtain that?

A. From the form T reports of the Southern Pacific Company to the Interstate Commerce Commission.

[fol. 3784] Q. And this, as to the Southern Pacific, is an aggregation of the information appearing on the form T reports for the several years?

A. That is correct, just a tabulation of the number of casualties occurring.

Q. I notice that for the year 1939, you have only the showing for the Southern Pacific. Is that explained at the foot of the sheet?

A. Yes, the I. C. C. accident bulletin for the year 1939 has not yet been made available.

Q. Has the exhibit been checked against the underlying sources to determine its correctness?

A. It has.

Q. Will you say whether or not it is true and correct?

A. It is.

Mr. Mason: Have you any questions, Mr. Strouss?

Mr. Strouss: No questions.

Mr. Mason: Your Honor?

The Court: No.

Mr. Mason: We offer the exhibit in evidence as Defendant's Exhibit 293.

Mr. Strouss: No objection.

The Court: It may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 293.")

[fol. 3785] Mr. Mason:

Q. Mr. Sullivan, have you a statement in a single sheet entitled, "Detail of Casualties to All Classes of Persons, Except Trespassers, Operation of Passenger Trains, South-

ern Pacific Company, State of Arizona, March and April, 1940"?

A. I have.

Mr. Mason: May this exhibit be marked No. 294 for identification?

The Court: It may be marked.

The Clerk: Defendant's exhibit No. 294 for identification.

Mr. Mason:

Q. Did you prepare exhibit No. 294?

A. I did.

Q. Will you state the sources from which it was prepared?

A. It was prepared from the carbon copies of the original form T's made by the Southern Pacific Company to the Interstate Commerce Commission for the months of March and April, 1940.

Q. Why did you select the months of March and April, 1940, for this particular showing?

A. It was during the months of March and April, 1940, that the passenger trains in excess of 14 cars were operated in the state of Arizona.

Q. Is this showing confined so far as the dates are con- [fol. 3786] cerned to the dates between which the operation of passenger trains of more than 14 cars was carried on?

A. No, it is for the entire two months of March and April, 1940.

Q. In point of fact, did the operation of such long passenger trains start before March 16th?

A. I think the information is in evidence, but I don't recall the date. I know that it was during March and April.

Q. In any event, you have included all of the reportable passenger train casualties during the two months?

A. That is correct.

Q. Has the exhibit been compared?

A. It has.

Q. Will you say whether or not it is true and correct as reflecting the form T reports?

A. It is.

Mr. Mason: Have you any questions, Mr. Strouss?

Mr. Strouss: No questions.

Mr. Mason: Has your Honor any questions?

The Court: No questions.

Mr. Mason: We offer the exhibit in evidence as defendant's exhibit No. 294.

[fol. 3787] The Court: It may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 294.")

Mr. Mason:

Q. Mr. Sullivan, I notice in item No. 1 you show a casualty to a passenger on consolidated trains Nos. 5 and 43. Have you made any further investigation of the circumstances of that accident?

A. Nothing except what appeared on the form T report and an examination of the train sheet that No. 43 and No. 5 had been consolidated at Dock for movement to Phoenix on account of failure of engine No. 43 due to a broken oil line between the engine and tender on account of striking boulder on track between Olberg and Dock.

Q. Does the form T report indicate which train, whether on No. 5 or on No. 43, the passenger had been or was riding?

A. No, the report indicated that the carrier had no knowledge of the injury which was alleged.

Q. When did the injury or alleged injury first come to the notice of the carrier's employees?

A. I don't know of my own knowledge.

Q. Is it indicated by the form T report?

A. It is not. I simply call attention to item 2 on the same report.

[fol. 3788] Q. Did that take place on one of the consolidated trains?

A. On one of the consolidated trains on the same date where the claim was made that it was due to a sudden stop of the train between Olberg and Dock where train No. 43 struck a boulder.

Q. Was that striking of the boulder the cause of the engine failure?

A. Yes.

The Court: It was not the same woman passenger, though?

A. No, a different woman. I simply drew attention to that because both injuries are claimed or alleged.

Mr. Strouss: What do you mean by "alleged"? Is this what was reported to the Interstate Commerce Commission as actually happening?

A. I can explain because I have personal knowledge of cases of that kind. Frequently, weeks or a month after an occurrence some passenger will report to a representative of the carrier that he has been injured and that is the first information that the carrier has of the accident. The rules of the Commission require that such alleged or claimed injuries be reported.

Mr. Strouss: I think if there is going to be a suspicion [fol. 3789] thrown upon the form T reports here that they should bring in the underlying records.

Mr. Mason: I don't think there is any suspicion thrown on the form T reports. The form T report, as I understand it, and you will correct me if I am not correct, carries a report to the Commission that the passenger alleged the injury?

A. That is correct.

Q. The form T report carries a statement that the passenger alleges or claims the injury?

A. That is correct.

Mr. Strouss: If there was no claim of injury until some weeks after, these underlying records will show it. If that is what they are trying to get in here, by inference, I would like to have the records brought in.

Mr. Mason: We are only emphasizing what the form T reports emphasize, that the passenger has claimed the injury.

Mr. Strouss: I think the form T report itself will speak for itself on that.

Mr. Mason: The form T report is available if you desire to examine it as an underlying document. We haven't made any effort to keep you from examining that.

The Court: Well, counsel having asked for the under- [fol. 3790] lying records, they may be produced and given to him.

Mr. Mason: We are prepared to give him the form T reports. We haven't used the others, and I don't think that we are required to give the others.

The Court: As I understand your testimony, Mr. Sullivan, the reports to the Interstate Commerce Commission classify these injuries to passengers in two different ways, that if the passenger makes an immediate report of the injury to the conductor or some other employee of the car-

rier that is reported in one way and where a report comes in days or weeks later that is reported in a different column?

A. No, it is reported in exactly the same manner on the same form. If the company employees or officers have knowledge of the injury, it is reported as an injury. If the carrier has no knowledge and the passenger simply alleged the injury, the form T report is made and simply states that the person alleged the injury but it is reported in the same manner as if the carrier's employees had knowledge of it. I didn't use any of the underlying data for the preparation of this exhibit. Had I thought I would have been permitted to do so, rather than using the reports to the [fol. 3791] government, I could have examined the files and possibly given more information than is on the exhibit, but I relied solely and wholly on the form T reports.

Mr. Strouss: My objection is not what the form T reports themselves show, but it is trying to get an inference to these reports which I don't think is on the face of the report itself. If there is to be any such inference given, then the reports to the trainmen or claim of the passenger should be produced here to show just what the situation was.

Mr. Mason: Your Honor, if there is any attempt to cast inference against the form T report, it proceeds from the other side, not from us. We have simply called attention to the fact there were two accidents on the same day and on the same train.

Mr. Strouss: But the inference has been left, at least by a suggestion, that this type of claim is not made often until weeks or months afterward by a passenger and by that an inference is made that this may have been one of that type of accident, in some way the passenger is faking or whatever inference they are trying to draw from it. If there is an inference other than what the form T report [fol. 3792] shows, I think the underlying records should be produced.

The Court: That is true, but counsel denies there is any such inference on his part. That is the only place you disagree.

Mr. Mason: We are only showing here what the form T report shows. If Mr. Strouss thinks it would be a better showing, we can eliminate items Nos. 1 and 2 here.

Mr. Booth: When a superintendent puts the word "alleged" in a passenger report, it is a very clear indication that he believes it didn't happen.

Mr. Strouss: I expect in almost every instance from the company's standpoint they think it didn't happen, what the passenger alleges. It is probably not unusual.

Mr. Booth: Well, the conductor may be one of your witnesses later on, and you can ask him.

Mr. Mason: I think the exhibit was received in evidence. Mr. Sullivan has one or two additional exhibits.

Q. Have you before you a statement in one sheet entitled, "Detail of Train and Train Service Accidents, Road Freight Train Operation, Reportable to the Interstate Commerce Commission, Southern Pacific Company in State of Arizona, April, 1940"?

[fol. 3793] A. I have.

Mr. Mason: May we have this statement marked, your Honor, as "Defendant's Exhibit No. 295" for identification?

The Court: It may be marked.

The Clerk: Defendant's exhibit No. 295 for identification.

Mr. Mason:

Q. Did you prepare exhibit No. 295?

A. I did.

Q. From what sources?

A. From the form T reports of the Southern Pacific Company to the Interstate Commerce Commission, that is, carbon copies of the office files.

Q. I take it that the information shown in the lower block of the exhibit was prepared from that which was stated of record by Mr. Fewtrell?

A. That is correct.

Q. Your exhibit shows the month of April, 1940. Why did you select that period?

A. That was the month during which freight trains in excess of 70 cars were operated in the state of Arizona.

Q. The details shown in column K of the exhibit, are those taken directly from the form T's?

A. Yes, that is a brief narrative as it appears on the form T.

[fol. 3794] Q. Does that truly and correctly represent what is shown on the form T reports?

A. It does.

Q. Are the form T reports used in connection with exhibit No. 294, the preceding exhibit, as well as in connection with exhibit No. 295 for identification available for the use of opposing counsel?

A. They are.

Mr. Mason: May the record show, your Honor, that these are hereby tendered to opposing counsel for their examination?

The Court: The record may so show.

Mr. Strouss: Which are these?

Mr. Mason: The form T's used in connection with these exhibits Nos. 294 and 295. Have you any questions on the exhibit, Mr. Strouss?

Mr. Strouss: No questions.

Mr. Mason: Has your Honor?

The Court: No.

Mr. Mason: We offer the exhibit in evidence.

Mr. Strouss: No objection.

The Court: It may be received.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 295.")

Mr. Mason:

Q. Mr. Sullivan, as to item No. 5 of this exhibit, you show [fol. 3795] the number of cars in the train as 91. Does the form T report show that the train was moving with 91 cars in it at the time of the accident?

A. No, it shows it was not moving. It shows that the accident occurred while the caboose was being handled by the engine, as indicated in column K.

Q. Then the speed of eight miles per hour indicated in column F is the speed of the engine and caboose?

A. That is it.

Q. Are there any other comments on the exhibit, Mr. Sullivan?

A. The calculations can be readily made from the basic figures shown in the lower block. It will show that 37,257 train-miles and 3,180,278 freight train car-miles were operated in Arizona in April, 1940, without a reportable casualty on the trains consisting of more than 70 cars. Calculations can also be made relating to train accidents against the train-miles and car-miles. While a month only shows

a small number of accidents, it will be noted that a miscellaneous train accident, a collision, a locomotive accident, and four train-service accidents occurred during the month [fol. 3796] which related to previous exhibits which have been introduced for a year would indicate that it follows the trend, as the same type of accidents may be found throughout the year. The collision, as shown in item No. 7, involved a light engine and a 58-car freight train. I have no further comments to make on the exhibit.

Mr. Masqn: I think that is all for Mr. Sullivan at this time.

Mr. Booth: I would like to call another witness, your Honor?

The Court: You may step aside, Mr. Sullivan.

(Witness temporarily excused.)

E. C. Bruns was called as a witness in behalf of the defendant and being first duly sworn testified as follows:

Direct examination.

By Mr. Booth:

Q. Will you state your name and residence to the reporter, please?

A. E. C. Bruns, 250 25th Street, San Bernardino, California.

Q. What position do you hold with the Atchison, Topeka and Santa Fe Railway Company?

[fol. 3797] A. Claim adjuster.

Q. How long have you occupied that position?

A. Two periods, this last time since 1927. A former period from 1914 to 1916.

Q. Between 1916 and 1927, what was your occupation?

A. I worked in the Los Angeles office from 1916 until 1927 as senior personal injury clerk in charge of the records.

Q. Are you familiar with the system of reporting accidents as required by the Interstate Commerce Commission?

A. I am.

Q. And with the form T reports and other reports required by them in connection therewith?

A. Yes, sir.

Q. Has the Atchison, Topeka, and Santa Fe Railway Company regularly maintained since prior to 1923 office files containing the office copies of the reports filed by it with the Interstate Commerce Commission pursuant to the rules for reporting accidents as amended in 1921?

A. It has.

Q. Have you prepared an exhibit consisting of one sheet and headed, "Atchison, Topeka and Santa Fe Railway Company, Casualties to Road Freight Trainmen and En-[fol. 3798] ginemen on Duty While on or Getting on or Off Road Freight Trains (Through, Local and Mixed), Main Line Territory between Clovis, New Mexico, and Gallup, New Mexico, Compared with Main Line Territory between Gallup, New Mexico, and Needles, California, as Reported to the Interstate Commerce Commission—Years 1923 to 1939, Inclusive"?

A. I have.

Mr. Booth: We ask that this be marked for identification as "Defendant's Exhibit No. 296."

The Court: It may be marked.

The Clerk: Defendant's exhibit No. 296 for identification.

Mr. Booth:

Q. I will ask you whether the figures in columns B, C, D, and E were taken from defendant's exhibit No. 140 introduced in evidence during the testimony of Mr. R. H. Weeks?

A. They are the same.

Q. Are the figures in columns X and Y computations made by you from those figures?

A. Yes, sir, they are.

Q. Made in what manner?

A. By dividing the freight train miles into freight car miles.

Q. Are the figures of averages in columns X and Y, lines [fol. 3799] 7, 14, and 20, averages of averages or are they averages of the added freight train miles and freight car miles for the respective periods?

A. They are the average of the grand-total of the seventeen years, not average of average.

The Court: That average of average might be quite misleading, might it not?

A. It might.

Mr. Booth: That is, the averages in line 7 are obtained by dividing the respective totals in line 7 into those shown in columns B, C, D, and E?

A: That is correct.

Q. And the same is true in line 14?

A. Line 14, 20, and 21.

Q. From what source were the figures in columns F to M, inclusive, taken?

A. F to M, inclusive, were obtained from the file copies of our form T reports as made to the Interstate Commerce Commission.

Q. Have you those file copies here in Tucson with you?

A. I have, yes, sir.

Q. Are they in the temporary office of defendant counsel at 90 Church Street, across the street from the courthouse here?

[fol. 3800] A. They are, yes, sir.

Q. Are they available for the examination of plaintiff's counsel?

A. They are.

Q. Are the figures in lines N, O, P, and Q additions made by yourself?

A. Yes, sir.

Q. Are they true and correct?

A. They are true and correct.

Q. Are the figures in R and S figures made by yourself?

A. Yes, sir, they are grand totals of the previous totals.

Q. Are the figures in columns T, U, V, and W made by yourself?

A. They are.

Q. They are capable of mathematical check on the face of the exhibit?

A. Yes, sir, they are just computations, divisions of casualties into train-miles and freight car-miles.

Q. Are all the figures shown on the face of this exhibit other than those testified to by Mr. Weeks true and correct to the best of your knowledge and belief?

A. They are.

[fol. 3801] Q. As to the detail of fatalities shown in the two blocks at the bottom of the page, one headed, "Clovis, New Mexico, to Gallup, New Mexico," and the other, "Gallup, New Mexico, to Needles, California," from what sources are those details taken?

A. Those details were taken from the form T's covering those particular accidents.

Q. They are not your conclusions but what are stated in the form T reports?

A. An abbreviated statement of what is contained on the form T in each instance.

Q. Are the distances between stations correctly stated in the four lines underneath the statement headed, "Main Line Mileage"?

A. They are.

Q. What is Clovis, New Mexico, in your operations, a freight terminal?

A. Yes, sir.

Q. Where crews change?

A. Yes, it is a freight terminal the same as Tucson is on your line here.

Q. What is Gallup, New Mexico?

A. That is a similar freight terminal.

Q. Is there an intermediate terminal between Clovis and Gallup?

[fol. 3802] A. There are two of them, one at Vaughn, New Mexico, and one at Belen, New Mexico, so that this area from Clovis to Belen covers three so-called "freight train districts."

Q. What is the situation between Gallup and Needles? Is Needles a freight terminal?

A. It is, and that area from Gallup to Needles comprises three freight train districts, Gallup to Winslow, Arizona; Winslow to Seligman; and Seligman to Needles.

Mr. Booth: Any questions, Mr. Strouss?

Mr. Strouss: No questions.

Mr. Booth: Your Honor, the Santa Fe line has been fully described, we think, by the Santa Fe witnesses, Mr. Mahoney, Mr. McDonald, Mr. Thomas and Mr. Blanchard, and we offer this exhibit in evidence.

Mr. Strouss: The same objections as heretofore made to exhibits from foreign roads.

The Court: The objections are overruled, it may be admitted in evidence.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 296.")

Mr. Booth:

Q. In line 22, stating "Period 1935-1939 Compared with Period 1923-1928," opposite the word "Improvement," there is Clovis to Gallup freight train miles per casualty, [fol. 3803] column T, 94.65 per cent. Is that intended to represent the ratio of improvement between the two periods stated?

A. It is.

Q. And the same is true as to line U, Gallup to Needles, 88.03 per cent?

A. That is correct.

Q. All of those figures opposite the two words "Improvement" in columns T, U, V, and W are ratios, are they not?

A. That is right. They are ratios of improvement, one block of years as compared with the other, as stated.

Q. The frequency of casualties is shown on this exhibit by the number of freight train miles per casualty and the number of freight car miles per casualty, respectively?

A. That is correct.

Q. The figure of 97,946, being the first figure in column T, is arrived at by what method?

A. It is arrived at by dividing the total number of casualties for that year, 1923, into the freight train miles.

Q. In other words, it is arrived at by dividing the top figure in column R, 12, into the top figure in column B, 1,175,346?

A. That is correct.

[fol. 3804] Q. And the same is true of all the others?

A. The procedure is the same in all columns.

Mr. Booth: I think I tendered the use of these form T's to counsel, if not they are in the office here.

Mr. Strouss: Someone will be here during next week?

Mr. Booth: Yes.

Q. Now, going to the detail of fatalities. You show only the fatal accidents reported. You have no detail of any others on this exhibit?

A. No, just the fatal accidents are detailed.

Q. Between Clovis, New Mexico, and Gallup, New Mexico, according to this, the only fatalities on trains of over 70 cars in length were "a brakeman murdered by hobos

on 84-car train" and "an engineer and fireman killed on a 99-car train by a locomotive boiler explosion"?

A. That is all in trains of over 70 cars.

[fol. 3805] Q. That was a rather severe derailment, May 16, 1937, where 35 cars were derailed by striking a bull on a bridge. Do you know whether the owner of the bull presented a claim for that?

A. Not to my knowledge.

Mr. Strouss: Rather an odd place for the bull to be, on the bridge?

Mr. Booth: Are there any comments you desire to make on this exhibit?

A. I think they are pretty well explained, they explain themselves, the figures, I don't think there is any particular comment.

Q. Yes, there are one or two questions I want to ask you. Suppose a freight brakeman is getting off of a freight train for the purpose of throwing a switch, and he has let go of the handholds, he is on the ground but he has not recovered his balance yet, and he falls. Although he is not touching any part of the train, is that considered a getting-off casualty?

A. Yes, they are so calculated.

Q. Suppose a trainman is walking or running toward a train to board the train after leaving it for some purpose, is that included?

A. If he was running in an attempt to get on the train, it would be included, and was included.

[fol. 3806] The Court: I take it, Mr. Bruns, from this exhibit, that in the territory between Gallup and Needles, as shown in column H, not a single engineman was killed during the 17-year period?

A. That is correct.

Q. I thought you had a fatal accident at Joseph City. Was that a passenger engineer that was killed?

A. That was a passenger train, as I recall it, Your Honor, it went through a bridge.

The Court: Yes.

The Witness: That was a passenger train, I think No. 8.

The Court: This fatality occurring on January 7, 1929, at Holbrook, that was the Peterson case over which you had considerable litigation?

A. No, the Peterson case wasn't a fatality. He struck a water crane at Flagstaff. The trial was held at Holbrook, as I well remember it, I attended it. I don't recall the name without going back to my working data of that brakeman involved in the Holbrook accident. It could be determined very readily.

The Court: Peterson subsequently died.

The Witness: This Holbrook, your Honor, locates the point of accident, and I know that Mr. Peterson that you [fol. 3807] refer to was injured at Flagstaff, Arizona.

Mr. Booth: No further questions?

Mr. Strouss: I have no questions at this time. I want to look at the form T reports before I decide.

Mr. Booth: Will it be convenient, Mr. Strouss, for you to let Mr. Sines know whether you want Mr. Bruns back?

Mr. Strouss: Yes, I will be glad to do that. I will let Mr. Sines know.

Mr. Booth: We have no further witnesses this evening.

The Court: The court will be at recess until ten o'clock tomorrow morning.

(Thereupon, the court stood at recess until February 7, 1941, at ten o'clock A. M.):

[fol. 3808] February 7, 1941, ten o'clock A. M.

Proceedings were resumed at this time as follows:

The Court: You may proceed.

Mr. Mason: I will call Mr. Bays.

G. A. Bays was called as a witness on behalf of the defendant and, being first duly sworn, testified as follows:

Direct examination.

By Mr. Mason:

Q. State your name.

A. G. A. Bays.

Q. Where do you reside, Mr. Bays?

A. 333 South Third Avenue, Tucson.

Q. What is your position with the Southern Pacific, Mr. Bays?

A. Assistant superintendent, Southern Pacific Company, headquarters, Tucson.

Q. Are you assistant superintendent of the Tucson division?

A. Yes, sir.

Q. What has been your experience in the Southern Pacific Company service, Mr. Bays?

A. I entered the service of the Southern Pacific Com- [fol. 3809] pany as a student brakeman in May, 1910 on the Western division, Oakland, California, and was promoted to conductor in May, 1913. At that time the divisions were split, and I was transferred from the Western division to what was known at that time as the Stockton division, and was then employed as conductor from May, 1913, to July, 1921. July, 1921, to October, 1921, assistant trainmaster; November, 1921, to June, 1922, conductor; July, 1922, to October, 1922, assistant trainmaster; November, 1922, to June, 1923, conductor; July, 1923, to November, 1923, assistant trainmaster; December, 1923, to June, 1924, conductor; July, 1924, to November, 1924, assistant trainmaster; November, 1924, to July, 1925, conductor; July, 1925, to November, 1925, assistant trainmaster; November, 1925, to July, 1926, conductor; July, 1926, to December, 1926, assistant trainmaster; January, 1927, to May, 1927, conductor; May, 1927, to August 13, 1928, assistant trainmaster. Then, on the 13th of August, 1928, I was promoted to trainmaster and transferred to the Tucson division, headquarters at Yuma, Arizona. I remained at Yuma, Arizona, as trainmaster from August 13, to June 30, 1932, as trainmaster.

Q. That was from August, 1928, to June, 1932, at Yuma? [fol. 3810] A. Yes, sir. During the depression I was transferred to Phoenix as terminal trainmaster, remained there from July 1, 1932, to September 30, 1933, and from October 1, 1933 to September 15, 1937, was trainmaster with headquarters at Phoenix, Arizona. On September 16, 1937, I was transferred to the Coast division as trainmaster, with headquarters at Watsonville Junction, remained there until January 31, 1938, and was promoted, transferred back to Tucson, Arizona.

Q. Promoted to assistant superintendent?

A. Assistant superintendent.

Q. And you have been here since?

A. Yes.

The Court: Gentlemen, before I overlook it, the fact is that today is a legal holiday, being Friday, February 7th, which is Arbor Day in Southern Arizona. In order that there may be no question as to the propriety of our proceedings, I wish that counsel would dictate into the record a stipulation that we may hold court today.

Mr. Strouss: I was wondering if it wouldn't be more proper after the proceedings are had and on the next court day to stipulate that the proceedings had today may become a part of the record as testimony properly and [fol. 3811] legally received.

The Court: That is satisfactory.

Mr. Mason: It is certainly entirely satisfactory to me; or it would be equally satisfactory to stipulate that today's proceedings may be regarded as taken in due form and order without regard to the fact that today is a legal holiday and as if the session had been held on a regular judicial day.

Mr. Strouss: That is agreeable to me.

The Court: Very well.

Mr. Mason: We can cover it both ways.

The Court: Proceed.

[fol. 3812] Mr. Mason: You were trainmaster of this division with headquarters at Yuma on August 4th and 5th, 1931?

A. Yes, sir.

Q. Were you in the courtroom yesterday when Mr. Sullivan testified and called attention to a derailment occurring at Dome on August 5, 1931, of train first No. 104 as shown in item 104 of Mr. Sullivan's exhibit No. 292?

A. Yes, sir.

Q. Are you familiar with the circumstances of the operation immediately preceding that accident as relating to the operation of that passenger train?

A. Yes.

Q. The showing on sheet No. 6 of exhibit No. 292 indicates that there was a train first No. 104. Have you examined the train sheets and will you say whether or not there was also a second No. 104 on that day?

A. Yes, sir, I have examined the train sheets and there was a first No. 104 and a second No. 104.

Q. How many cars were in second No. 104 leaving Yuma?

A. Second No. 104 leaving Yuma, consist 14 cars.

Q. Were there two sections to train No. 104 into Yuma [fol. 3813] from the west on that day?

A. No, sir, one section into Yuma.

Q. Did the train entering Yuma consist of more than 14 cars?

A. Yes, sir.

Q. Do you know and, if so, will you state why train No. 104 was broken up into two sections at Yuma?

A. It was necessary on August 5, 1931, to run two sections of No. 104 from Yuma on account of more than 14 cars to move, and in order to comply with the state law we ran the first section consisting of two head-end cars and a coach, three cars, and the second section, 14 cars.

Q. Were there at that time regularly assigned crews in passenger service?

A. Yes, sir.

Q. Was there a crew regularly assigned to handle train No. 104 out of Yuma eastward?

A. On this date the regular crew manned second No. 104.

Q. Where did you obtain the engine crew, the engineer and fireman for first No. 104?

A. From our extra list at Yuma, our enginemen's extra list which is known as "pool freight extra list" from the Phoenix district.

[fol. 3814] Q. Were the engineer and fireman handling first No. 104 regular passenger enginemen or extra freight enginemen?

A. They were extra freight and extra passenger men also.

Q. Why did you call an extra man from a freight pool to handle a passenger train movement?

A. Because this man that stood for this run was first out, and he was called in compliance with the working agreement.

Q. He stood for the work?

A. He stood for the work.

Mr. Mason: That is all.

Mr. Strouss: I have no questions, but I would like to have the train sheets.

Mr. Mason: Will you furnish Mr. Strouss with the train sheets?

The Court: It was the first section that was involved in the derailment?

A. Yes, sir, the first section.

Mr. Mason: Will you hand the train sheets for August 5, 1931, for the Yuma-Tucson-Gila district to Mr. Strouss and indicate if you will where the movement of first and second No. 104 is shown.

Mr. Strouss: After we reconvene, I may have some questions about that.

[fol. 3815] Mr. Mason: That is understood. Has your Honor any further questions?

The Court: No.

Mr. Mason: May Mr. Bays be excused for the time being?

The Court: Yes.

(Witness temporarily excused.)

W. P. Herbert was recalled as a witness in behalf of the defendant and having been previously sworn testified further as follows:

Direct examination (Continued).

By Mr. Mason:

Q. Mr. Herbert, at page 3061 of the reporter's transcript of your testimony while on the stand previously, you were asked by Mr. Strouss to verify certain figures excerpted by him from the forms 521 relating to operations on the Salt Lake and Tucson divisions?

A. Yes, costs per thousand gross ton-miles.

Q. Have you undertaken to verify those figures?

A. I have.

Q. Will you state whether there were any corrections in the figures recited to you by Mr. Strouss?

[fol. 3816] A. I found two to be corrected.

Q. The others were all correct?

A. Yes.

Q. Will you recite the correct figures, that is to say, the figures stated to you by Mr. Strouss which are incorrect and the corrected figures which should replace them?

A. The cost per thousand gross ton-miles on the Tucson division, main line only, as stated by Mr. Strouss for the

year 1927 was $0.454. As I checked it, it should be $0.504. For the same division, same cost, year 1925, in the record shows $0.582. I have checked it to be $0.578.

Q. Mr. Herbert, will you refer to exhibit No. 200, please?

A. Yes, sir.

Q. Have you made a study of the division records to determine which of the public crossings shown for the year 1938 were in towns and cities or within one mile of the entrance to the yard or siding on either side of the stations in such towns and cities, giving the total by number and the towns and cities where they are.

A. Yes, except that I checked the year 1939 which is the last year shown on my exhibit No. 200. Examination of the [fol. 3817] records of the Tucson division engineer's office reveals that at the following stations, namely, Yuma, Gila, Tempe, Benson, Willcox, Buckeye, Phoenix, Tucson, Chandler, Bowie, Casa Grande, Mesa, Cochise, Coolidge, and Douglas there was a total of 82 public road crossings. In addition to those eighty-two, there were two state highway crossings across the main track of the Southern Pacific in Arizona.

Q. Where were those?

A. One at Dragoon and one at Bowie at that time.

Q. Do you include in the 82 public road crossings that you have just recited a crossing at Mesa?

A. Yes.

Q. On highway 87.

A. Yes.

Q. And a crossing at Benson on highway 66?

A. Yes.

Q. I notice that you mention the station at Douglas. That involved an examination of the Rio Grande division record, did it not?

A. Yes, it did.

Q. Then, with the addition of these two at Dragoon and Bowie, there is a total of 84 crossings in all in the towns or immediately adjacent thereto out of the total shown for [fol. 3818] the year 1939, is that correct?

A. That is correct.

The Court: What is that total for the year?

Mr. Mason: As indicated by exhibit No. 200, at the end of the year 1939 it was 654.

Q. Have there been any of these 84 crossings eliminated or presently in process of elimination?

A. Yes, since 1939 up to the present time, three of the total of those 84 crossings have been eliminated or are in the process of elimination. The crossing of State Highway No. 66 at Bowie was eliminated by underpass; the crossing at Central Avenue in Phoenix was eliminated by underpass; and an underpass on State Highway No. 87 at Mesa, Arizona, is now under construction and the state highway crossing is now closed for traffic.

Q. Does your total of 84, or now 81, include any rural crossings or only those in towns?

A. Only those in towns mentioned and the state highway crossings that might be between those towns.

Q. You include state highway crossings?

A. Yes, State or Federal highway crossings. There happen to be no Federal highway crossings.

The Court: Mr. Herbert, what proceedings are necessary [fol. 3819] in order to establish a grade crossing? Can any individual at any point on the line demand that there be a crossing and the railroad fixes a crossing for him?

A. If they desire a public crossing, as I remember when I was here, they have to take it up with the State Corporation Commission, and the State Corporation Commission is the one that decides whether or not the crossing is necessary and if they find it to be necessary they order the crossing put in; as to private crossings, that, as I understand it, is just an agreement between the railroad and the party desiring the crossing. In the case of private crossings, they are covered as a rule by agreements.

The Court: You don't have the figures at hand that would show how many of these 654 crossings were private crossings and how many were public?

A. They are all public crossings.

[fol. 3820] Mr. Strouss: Those are determined by hearings before the Commission as to the public necessity and convenience?

A. Yes. There is one question the Court asked on my previous testimony, as to private crossings all having gates, whether it is fenced or not. There are cases where private crossings do not have gates, but they would still be considered private crossings and the parties entering into those agreements are responsible for the crossings.

Mr. Mason: Mr. Herbert, I show you an exhibit in a single sheet, consisting in part of a drawing or plan and in part of a tabulation, and bearing the title, "Estimated Cost of a Terminal at the Arizona-New Mexico State Line For the Reconsisting of Freight Trains." Did you participate in the making of the studies preparatory to this exhibit?

A. Yes.

Mr. Mason: May this be marked, if your Honor please, as defendant's exhibit next in order, No. 297?

The Court: It may be marked.

The Clerk: Defendant's Exhibit No. 297 for identification.

Mr. Mason: Did you make a study of the track maps and [fol. 3821] station layout at the station of Cavot preliminary to the preparation of the chart and tabulation on Exhibit 297?

A. Yes, I did.

Q. Were you instructed so to do?

A. Yes.

Q. By whom?

A. By Mr. Sines.

Q. Are you familiar with the main line at or adjacent to Cavot?

A. Yes, I am.

Q. How did you acquire that familiarity?

A. Well, from my experience on the Tucson division, having worked on the ground at that point and in that vicinity for quite a few years, and a study of the records in the office of the division engineer at Tucson.

Q. Did you make any preliminary inspection of the track and the adjacent territory at Cavot for the purposes of this exhibit?

A. Yes, I made a special trip and study, on-the-ground study, for the purpose of this estimate.

Q. Now, will you say whether or not the actual track layout as indicated by your exhibit is your own plan or a plan which you were asked to consider and study from the standpoint of feasibility and cost?

[fol. 3822] A. Well, that plan was presented to me in its present form for me to ascertain the cost for such track construction.

Q. Now, what is the source of the information as to the mile-posts, grade and distances shown on the chart at the upper part of the exhibit?

A. It is from the company's track maps and profiles.

Q. What do the initials T. C. followed by degrees, minutes and seconds expressed in figures, indicate?

A. "T. C." represents total curvature.

Q. Are those figures taken from the track map?

A. Yes, they are.

Q. Is the station of Cayot immediately at the Arizona-New Mexico line?

A. It is, the Arizona-New Mexico line practically bisects the siding at Cayot.

Q. By the way, you show a dashed line at the siding of Cayot. Is that the present siding at that station?

A. Yes, it is.

Q. And the heavy line across the map is an outline of the main track, is it?

A. That is the main track.

[fol. 3823] Q. The light lines are what?

A. They are the necessary additional tracks and side-tracks.

Q. From what source did you obtain this figure of the grade which is indicated just below the map?

A. That is obtained from our detail profiles.

Q. This distance to Steins, what does the "E. SW" mean?

A. That means it is 1.73 miles from the east switch of this proposed layout to Steins, New Mexico.

Q. Would that be to the station at Steins?

A. Yes.

Q. And this figure of total curvature, state line to east switch, which you show, is that an aggregation of figures of total curvature indicated on the exhibit?

A. Yes, that is a summation of the total curvature shown for the curves shown between the Arizona-New Mexico State line and the east switch of this yard layout.

Q. Now, is that simply the total curvature of the main track, or is that the curvature of the main track considered by itself and then added to that the curvature of each of the switches as they are planned here?

[fol. 3824] A. No, that is just the total curvature of the main track alignment.

Q. Going to the lower part of the exhibit——

The Court: By the way, when was this estimate made, Mr. Herbert?

A. It was made in the last three or four weeks.

Mr. Mason: I will ask you to refer back to your exhibit 202. Did you follow the same methods in connection with the preparation of this tabulation and in the preparation of the figures which enter into the tabulation which was followed in preparing the figures on Exhibit 202?

A. Yes, I did.

Q. Where do you obtain your figures of the quantities, for example, the track feet of new sidings and of an additional track. Are those from scale measurements on the detail drawings?

A. Yes.

Q. The figures as to quantities of cut and fill? How did you determine those?

A. They are obtained from actual on-the-ground study.

Q. As to item 3, how did you obtain that figure?

A. That is also obtained from an on-the-ground study, and from our regular standard drawings of those culverts [fol. 3825] and the unit cost of their construction.

Q. As to item No. 6, did you take that from an on-the-ground study?

A. Yes, I counted the poles that would be necessary to be moved. Those, incidentally, are very heavy poles, heavy in the number of wires on the poles. They consist of about forty to fifty wires each.

Q. Now, you show in item 7, the cost of building a telegraph office. From what source do you take that figure, and the figure for the frame dwellings?

A. They are obtained from our standard drawings for such buildings and the cost that accrued from past construction of similar buildings.

The Court: Is there now a telegraph office at Cavot?

A. No, there is not. There is nothing there now except that one sidetrack and spur.

Mr. Mason: There is a concrete telephone booth there?

A. There is a concrete telephone booth there, yes.

Q. What is the source of the figures in line 4 of the estimate?

[fol. 3826] A. I obtained them from our signal engineer in San Francisco, having given him the layout plan and he in turn sent me the detail work necessary to be done and I

have examined those plans, and to my own knowledge they are correct.

Q. Have you yourself supervised the relocation of automatic block signals on this division?

A. Yes, I have.

Q. Is there any present water supply at Cavot?

A. No, there isn't.

Q. How did you obtain the figure in line 8?

A. That is an estimate of what it would cost if water was available. However, that might be problematical, whether they would find water for that money, and for that reason it might be understated. However, if water is obtained at any reasonable depth, it would cost about a thousand dollars to get it.

Q. Now, do I understand, Mr. Herbert, that as to the actual layout itself, you are not prepared to testify as to its details or the manner in which it would be used, but have simply made the study from a plan which was furnished to you?

A. That is right.

Q. In the same manner as in connection with Exhibit No. 202?

[fol. 3827] A. Yes, that is right.

Mr. Mason: Have you any questions, Mr. Strouss?

Mr. Strouss: No.

Mr. Mason: Has your Honor any questions?

The Court: No.

Mr. Mason: I think that is all we have of Mr. Herbert at this time.

The Court: Mr. Herbert, if this plan were followed, does your company contemplate switching your division point from Lordsburg over to Cavot, or is this merely a proposed construction right at the state line where you might reconsist these trains?

A. Well, that might be better explained by another witness, but, as I understand it, it is just for reconsisting trains.

Mr. Mason: I propose to have Mr. Sines testify as to the operations which would be carried on, your Honor, and to offer the exhibit after he has testified in connection with it.

The Court: Any further questions of this witness?

Mr. Mason: No.

Mr. Strouss: I have none at this time.

Mr. Mason: He will return for cross-examination this [fol. 3828] afternoon. Will you take the stand, Mr. Sines?

B. S. Sines was recalled to the stand, and testified further as follows:

Direct examination (Continued).

By Mr. Mason:

Q. Mr. Sines, will you refer to defendant's exhibit No. 297 for identification?

A. Yes.

Q. Did you prepare the contemplated plan of trackage at or adjacent to Cavot which is indicated on that exhibit?

A. I did.

Q. Now, will you state, in the first place, the reason why this trackage would be located at the point indicated on the exhibit rather than at some point either east or west of that location?

A. The initial switch at the west end of the layout is placed immediately at the Arizona-New Mexico state line, and the layout then proceeds from that point easterly, the idea being to avoid exceeding the Arizona seventy-car law within the State of Arizona and at the same time to cut down the extraterritorial effect of the law to a mini- [fol. 3829] mum.

Q. Now, will you explain why the plan contemplates the sidings as proposed on the south side of the track, and, as well, why the sidings as proposed are contemplated on the north side?

A. Yes. There are three sidings on the south side of the track, consisting of a 125-car siding and 2 70-car sidings, in the order of their position from the main line toward the south. The 125-car siding is for the purpose of building up 70-car trains which would arrive from Arizona. The other two 70-car tracks would be for the purpose of receiving and holding 70-car trains while the 125-car train is in the process of being built up. At those times when it would be possible to consolidate three seventy-car trains into two 105-car trains, if those trains happened to be operated to

the maximum 70-car limit, it would be necessary to provide tracks to receive and accommodate three trains. It would take some time to assemble the three 70-car trains into two longer trains, and enough track must be provided to clear the main line while that operation was in progress.

Q. Do trains actually follow each other in present-day operation so closely as to require such storage or hold [fol. 3830] tracks to be made available?

A. Yes. A very good appreciation of that situation can be obtained from the chart which I have previously introduced of train movements on June 18, 1938, which exhibit is No. 220. On that day there would have been an opportunity to consolidate the three trains which actually arrived at Cavot at approximately 8:20, 8:30 and 9:10 A. M., and the operation would have been for the first seventy-car train to enter one of the seventy-car tracks, for the second seventy-car train to enter the 125-car track, and for the second train to pick up 35 cars from the first train, making a 105-car train, and leaving 35 cars on one of the 70-car sidings. While this operation was in progress, the third train would have arrived and would have gone in on the third track provided for its use also. Such consolidation occurs when the trains are grouped in groups of three, that is, when three trains are operating closely together. When they are scattered out, as they were earlier on that day, the opportunity for consolidation is less favorable.

The Court: What is the total distance from the state line eastward to the end of your proposed sidetracks on this Exhibit 297?

[fol. 3831] A. That would be approximately 200-car lengths or 9200 feet, or 1.74 miles. That would be the distance from the state line to the east switch of the westbound 125-car track. Operations westbound would present a somewhat different picture in that 125-car trains would approach the state line from Lordsburg and would there be faced with the necessity of setting out 55 cars, but during that operation it would be necessary to provide for the train to enter a siding and to provide for a second track upon which the 55 cars could be set out. That process would be repeated two or three times during the day until 70 cars or more had been built up, at which time a short 70-car train would be operated from Cavot into Arizona.

Mr. Strouss: I think I should have my objection in here. This exhibit has not been offered yet, and there is testimony here I want an objection to as irrelevant, immaterial and purely speculative.

The Court: Yes, it should be offered.

Mr. Mason: I intended to offer the exhibit after the witness had supported it by a study of the situation.

Mr. Strouss: For the purpose of the record I would like to move to strike this testimony.

The Court: The motion to strike will be denied.

[fol. 3832] Mr. Mason:

Q. Mr. Sines, have you made a careful study of the situation at Cavot and on the north line of the Tucson division for the purposes of the showing indicated on exhibit No. 297 for identification?

A. Yes, sir.

Q. Will you say whether or not from that study the trackage indicated on exhibit No. 297 for identification represents the trackage which would be required and necessary if reconsisting operations would be undertaken at Cavot in order to avoid extraterritorial effect of the Arizona Train Limit law?

A. It does.

Mr. Mason: We offer the exhibit in evidence as defendant's exhibit No. 297.

Mr. Strouss: I object to it as incompetent, irrelevant, and immaterial, calling for conclusions and purely speculative.

The Court: Objection overruled, it may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 297.")

Mr. Mason:

Q. Mr. Sines, I think you said the distance from the link to the east switch was 9,700 feet and, as I read the exhibit, it shows a milepost 1125 just west of the state [fol. 3833] line and milepost 1127 a short distance west of the east switch layout as planned here. Will you give the matter further consideration and say whether or not your previous estimate of 9,700 feet is correct or slightly short?

A. The 9,700 feet is short, obviously it is something over two miles in length. My statement that there were two hundred car lengths between sidings was inadequate in that I hadn't allowed for switches and cross-overs. The length is approximately 2.1 miles.

Q. Mr. Sines, from your experience as a railroad construction engineer and from your experience with railroad operations generally, will you say whether or not the territory at and immediately east of Cavot represents a satisfactory location for a terminal?

Mr. Strouss: That is objected to as irrelevant and immaterial and calling for a conclusion.

The Court: Overrule the objection, you may answer.

The Witness: Will you read the question, please?

(The question was read by the reporter.)

Mr. Mason:

Q. By that I mean, the territory immediately along the [fol. 3834] main line as presently located?

A. It does not represent a satisfactory location for a terminal.

Q. Why is that?

A. Because of the curvature and grade involved in the layout on exhibit No. 297. The principal consideration for the selection of this location was to locate a yard immediately east of the state line, but such a location would be impracticable both from an engineering and from an operating standpoint.

Q. Have you in mind the 1.4 per cent ascending eastward?

A. Yes, sir.

Q. What does a grade of that character involve insofar as switching operations are concerned?

A. It would be a very difficult switching operation. By comparison, the Tucson yard is laid out on a one per cent grade and whenever a train enters the Tucson yard our employees are instructed, and they do, because I have seen them, set the hand brakes on 15 cars on the downhill end of the train and 10 hand brakes on the uphill end of the train before the engine is disconnected.

Mr. Strouss: May the record show my objection to all of [fol. 3835] this?

The Court: Yes, it may show the objection and it is overruled.

The Witness (Continuing): On this much steeper grade we would probably insist on setting the hand brakes on every car that was left standing on the side tracks not connected to an engine.

Mr. Mason:

Q. Is Cavot in the center of the helper district?

A. It is at the easterly end of the helper district. There is a helper district from San Simon to Steins, a distance of 14 miles, and Cavot is 3 miles from Steins.

The Court: The summit is located at Steins?

A. Yes.

Mr. Mason:

Q. Does the matter of the helper service in connection with the trains made up or cut down at Cavot enter into the problem at all?

A. That would present another consideration which would have to be overcome and which would be taken care of by assigning another helper engine to the San Simon-Steins territory. I can explain what that operation would be if you think it desirable.

The Court: The Court does not think it is necessary, [fol. 3836] Mr. Sines.

Mr. Mason:

Q. How does the trackage as you have planned and shown it on exhibit No. 297 compare with the trackage as it now exists at Lordsburg?

A. We have a yard somewhat larger than this at Lordsburg where the trains are received and from which they depart and in addition to that train yard we have several thousand feet of additional track to take care of any overflow or additional storage space required. In comparison to the yard at Lordsburg, this yard is considerably smaller.

Q. How does the layout at Cavot compare with the layout of the yard at Yuma?

A. The same thing holds true with respect to Yuma. At Yuma there are eight or ten train tracks providing for the

making or breaking up of the trains in addition to which there is additional storage space.

Q. What station force would be contemplated at Cavot if reconsisting operations were undertaken?

A. We would have to have a telegraph operator on duty around the clock, that is, for the entire twenty-four hours to hand up orders to train crews and helper engines and in order to permit the operation at Cavot to be properly supervised.

[fol. 3837] Q. Would there be any necessity for a watchman?

A. Yes, occasion might arise where loaded cars would stand on these tracks for several hours and it would be necessary to provide watchman service, although whether that would require full twenty-four hours would depend upon our luck with what would happen at Cavot. If we were not bothered by pilferage, we might not have to provide a watchman all the time but undoubtedly there would be a watchman at Cavot some of the time.

Q. Would this additional trackage require any additional expense for maintenance?

A. Yes, the maintenance figure that we used for estimating the additional cost of our siding program in connection with the long train program was ten cents per foot per year. This layout provides for an additional 28,489 track feet at a cost of ten cents per foot, produces $2849.00 maintenance expense per year.

Q. What is the annual cost of the telegraphers?

A. The three telegraphers would cost $7,183.00 per year.

Q. Wages?

A. Wages.

Q. Have you computed the interest cost on the invest-

[fol. 3838] ment required to produce this layout?

A. The interest cost on the investment charged at the same 4 per cent which I have used in connection with my long train siding program computed against the $186,460 would be $7,458 per year.

Q. What does that make the total annual cost as you have computed it?

A. $17,490.

Q. I will ask you whether, predicating your answer upon your experience as heretofore related, the contemplated construction and expense at Cavot could in any way be

lessened or whether the layout and expense you have indicated represents the minimum for the purposes shown?

A. This represents a minimum for the purposes shown. I have referred to the 1.4 grade and the exhibit itself also indicates total curvature of 410 degrees. We undoubtedly would make some effort to lessen that grade by line changes and to cut down the curvature by other line changes, all of which would increase the total cost of the project.

Q. Your study does not include any expense of line change or curvature reduction or grade reduction?

A. No.

Q. You are simply taking the track as it is and building [fol. 3839] sidings alongside of it?

A. Parallel to the main line, yes.

Q. Mr. Sines, in your testimony on February 4 at page 3543 of the transcript, there was some discussion as to the relative expense items appearing on form 521 and the proportion of those expenses which had been included in the cost exhibit, showing the savings which would result or did result from long train operation?

A. Yes.

Q. I refer particularly to exhibit No. 253 which shows a figure of $.5158 per train-mile saved based upon the application of the total net saving on the 1938 redispatch to the total figure of train-miles eliminated?

A. That is right.

Q. I believe you testified that form 521 for the Tucson division for the year 1938 reflects an average cost per train-mile of $1.285?

A. Yes.

Q. What, if any, is the significance of the difference between the $0.5158 which you show on exhibit No. 253 as the average value per train-mile saved and the $1.285 which is shown on form 521 as the average cost per train-mile for the year 1938 on the Tucson division?

[fol. 3840] A. There is no particular significance in the difference in the size of those two figures in the abstract but in reviewing my testimony later I realized I hadn't completed my thought that I had in referring to form 521.

Q. Will you please explain the relationship further, then?

The Court: We will take our morning recess at this time.

(Thereupon a short recess was taken, after which proceedings were resumed as follows.)

Mr. Mason:

Q. Mr. Sines, you were about to state the figures which the form 521 for December, 1938, shows for the Tucson division—I have that here if your Honor wants to look at them and follow the testimony.

The Court: All right.

A. The Tucson division form 521 for December, 1938, shows the following: fuel excluding line freight charges, 49.5 cent; enginemen, 23.7 cents; trainmen, 31.5 cents; engine house, 6.3 cents; other locomotive supplies, 5.0 cents; train supplies and expenses, 2.9 cents. Total, 118.9 cents or $1.189.

Q. That is the train-mile cost of the main and branch, is it?

[fol. 3841] A. Yes; if the freight line charges on fuel had been included, the cost per train-mile amounts to 1.285 cents. The reason for excluding line freight charges mentioned here is that this represents the cost to the Southern Pacific Company for fuel oil delivered to the Southern Pacific Company at such points as Yuma, Arizona, and Sparks, Nevada, by which means the Southern Pacific Company avoids paying the California sales tax on fuel oil to be used outside of the state of California. The oil companies pay the commercial freight charges and add those commercial freight charges to the California price of fuel thus offsetting the freight charges by an equal amount of revenue to the Southern Pacific Company and thus furnishing the reason for excluding such charges in the cost statement which I have just quoted.

Mr. Mason:

Q. Then the cost of fuel excluding line freight charges represents the net cost to the Southern Pacific Company?

A. Exactly.

Q. The freight charges being added in to the delivered price at Yuma and then subtracted in figuring the cost on the form 521?

A. On the form 521 it is figured both ways, the $1.285 includes the line freight charges and the note "A" appear-

[fol. 3842] ing on the face of the form 521 refers to a computation on the back of the sheet wherein the line freight charges are excluded and the net cost of the fuel is shown per train-mile.

Q. What items have you included in the cost statement which you have prepared in connection with the redispatching study?

A. I have included items for fuel, enginemen, and trainmen which for the year 1938 on the Tucson division represented a total of $1.047 or 88.2 per cent of the total, $1.189.

Q. As to train supplies and expenses, will you explain that item and why it is not included?

A. The item of train supplies and expenses which is Interstate Commerce Commission Account No. 402 is an item associated with inspecting, lubricating, cleaning, heating, icing, and watering cars and would not vary appreciably because of the adoption of long train operation inasmuch as the total number of cars handled will remain the same.

Q. You leave it out on both sides of the computation, do you?

A. I have.

Q. What as to engine house expenses and other locomotive supplies?

[fol. 3843] A. Engine house account No. 400 and other locomotive supplies which is a combined figure representing accounts Nos. 397, 398, and 399 and which in 1938 represented 9.5 per cent of the total.

Q. That is to say, engine house plus locomotive supplies jointly represent 9.5 per cent?

A. Yes.

Q. Proceed.

A. And are associated with caring for and preparing locomotives for service with water, lubricants, and other supplies for train locomotives and incidental labor and would not appreciably increase or decrease with train lengths because while the new locomotives would be somewhat larger there would be fewer of them and these expenses would probably remain at approximately the same level as those actually experienced in 1938.

Q. What other item other than the items of fuel, wages for enginemen and trainmen, and these last three items which you have been discussing, that is to say, engine house, other locomotive supplies and train supplies and

expenses, enters directly into the cost of train transportation?

A. The other direct expense is locomotive repairs, which item I covered in testimony in exhibits Nos. 254 and 255.

[fol. 3844] Q. Mr. Sines, have you made a study of the forms 521 insofar as they show the total number of freight train-miles and freight train car-miles made on branch lines and main line or branch lines and main line combined of the Salt Lake and Tucson divisions?

A. I have.

Mr. Mason: I may explain that this is in connection with your Honor's question yesterday as to mileage in the two states of Arizona and Nevada as a possible index of the opportunity for accident and casualty in the two states.

Q. I will ask Mr. Sines first whether the main and branch line train-miles and car-miles by states are immediately available?

A. No, they are not.

Q. Can they be made available by a comparatively short study?

A. They can, and I propose to have them in the course of a week.

Q. Can you give the main and branch line figures of train-miles and car-miles of the two divisions to indicate whether branch line train-miles or car-miles are substantial in proportion to the total for the divisions?

[fol. 3845] A. I have those figures for both the Salt Lake and Tucson divisions as reported on the forms 521, the operating statistics sheets.

Q. For what period?

A. For the year 1940.

Q. Will you give the figures and the percentage relationship?

A. Train-miles, main line, total, 2,451,653; branch line, 134,064.

The Court: Which division is this, Mr. Sines?

A. Salt Lake division.

The Court: Will you read those figures, Mr. Reporter?

(The last answer was read by the reporter.)

A. Total main and branch lines, 2,585,717; percentage of branch to total, 5.19. Car-miles, main line, 205,733,213;

branch line, 1,815,273; total main and branch, 207,548,486; percentage of branch to total, 0.88 or less than one per cent. Tucson division for the year 1940, freight train miles, main line, 2,493,497; branch, 175,379; total main and branch, 2,668,876; percentage of branch to total, 6.58. Car-miles, main line, 150,317,995; branch, 4,852,706; total main and branch, 155,170,701; percentage of branch to total, 3.12.

[fol. 3846] Mr. Mason: Mr. Sines, have you before you a statement in two sheets entitled "Yuma, Arizona, to El Paso, Texas, via Gila and Lordsburg, Estimated Number of Meets and Passes Eliminated by Long Train Operation, June and August, 1938; Expanded to Annual Basis"?

A. Yes.

Mr. Mason: May we have this statement marked defendant's exhibit No. 298 for identification?

The Court: It may be marked.

The Clerk: Defendant's Exhibit No. 298 for identification.

Mr. Mason: Did you prepare or supervise the preparation of this exhibit, Mr. Sines?

A. I did.

Q. Will you refer first to sheet two of the exhibit and explain just what you have done in connection with that sheet?

A. The figures at the top of sheet two and directly above the dates indicated on the chart represent train counts and counts of meets and passes which were made off charts prepared for those particular dates in a manner similar to charts prepared for June 18, 1938, Exhibit No. 220.

Q. Were those charts prepared from the actual train sheets of those particular days?

[fol. 3847] A. They were.

Q. Now, in making the count of trains, did you count them in the same manner as they were counted on Exhibit 220?

A. I did.

Q. And did you count meets and passes in the same way?

A. I did.

Q. Then, what was your next step after finding the number of trains and the number of meets and passes on the various dates which are indicated?

A. Those points were plotted on the chart, sheet 2, in accordance with the scales at the bottom and right-hand

side of the chart, the number of trains being indicated at the bottom, and the number of meets and passes along the right side of the chart.

Q. I take it that each of these squares reading to the right, that is, these large squares reading from the right from the zero indicated at the foot of the sheet represents 20 and each very small square represents 2?

A. That is right.

Q. And is the same scale used in reading from zero at the foot of the chart up toward the top?

A. Yes.

[fol. 3848] Q. Then the points are plotted according to the number of trains and the number of meets and passes?

A. That is right.

Q. Then, having plotted the points, what was the next step?

A. To compute the path of a line most closely fitting the points which had been plotted according to a process of analytic geometry which gave us the equation of the line indicated on the exhibit, sheet 2.

Q. Is that a rather common and ordinary problem of plane analytic geometry?

A. It is.

Q. And did you obtain the line which is plotted as a solid curve line on the sheet in that manner?

A. I did.

Q. And solved for the equation?

A. I did.

Q. And what is that equation?

A. M equals 0.042946T to the 1.925 power where M equals the number of meets and T equals the number of trains. That should be "number of meets and passes."

Q. Now, given the number of trains on a particular day, [fol. 3849] can you by means of that formula or that equation obtain the number of meets and passes in the territory between Yuma and El Paso via Gila, Tucson and Lordsburg?

A. Yes, in the average aspect.

Q. Now, will you turn to Sheet 1 of the exhibit and, referring to column B, state from what source it is taken?

A. That is taken from a count of the trains actually operating in freight service in the territory between Yuma, Arizona, and El Paso, Texas.

Q. Is that taken from the actual train sheets?

A. Yes.

Q. And column C, what is that?

A. That indicates the number of passenger trains operating on the dates indicated.

Q. That is a train count made in the same way as you made the train count for exhibit No. 220?

A. Exactly.

Q. And what is column D?

A. The total of the preceding two columns.

Q. Did you follow the same process as to the columns collectively headed "Actual" for the entire period of 61 days, from June 1st to 30th, and August first to 31st, indicated here?

[fol. 3850] A. I did.

Q. Now, how did you obtain the figures in column E for each of these days?

A. That was read off the chart which is sheet 2 of this exhibit, by entering the chart, using the number of trains indicated in column D, ascending on the train line to the point where the train line intersected the curve on sheet 2 and then reading the number of meets and passes on the scale to the right opposite the point of intersection.

Q. Is that equivalent substantially to solving the equation which is shown on sheet two?

A. The same thing.

Q. Now, going to the part of the first sheet headed "Redispatched," where did you obtain the figures in column F?

A. From a count of the freight trains appearing on the redispatch train sheets for the months of June and August.

Q. Is that an actual count from the redispatch train sheets for the dates indicated?

A. Yes, sir.

Q. And for passenger trains, did you use the same source?

A. The same.

[fol. 3851] Q. And obtained the totals in column H the same way as in column D?

A. Yes.

Q. How did you obtain the figures in column I?

A. Those figures are read off of the chart, sheet 2, in a manner similar to the figures appearing in column E.

Q. And the figures at the foot of the sheet appearing with the word "total" to the left of the line, what are those?

A. Those are summations of the figures appearing in the columns immediately above.

Q. And the line headed "meets and passes eliminated by redispatch study," what is that?

A. That is the difference in the totals, appearing at the foot of columns E and I.

Q. You subtracted the total in column I from the total in column E?

A. Yes.

Q. How did you obtain the final figure in the lower righthand corner of the first sheet of the exhibit?

A. By expanding the different figures just described in the ratio of 17.89 to 100.

Q. That is the ratio of the gross ton-miles made on the district in question during June and August, 1938, as com-
[fol. 3852] pared to the gross ton-miles made on the district during the entire year 1938?

A. Yes, sir.

Q. As explained in connection with previous exhibits?

A. Yes, sir.

Q. Have these computations been checked?

A. They have.

Q. Are you as a mathematician prepared to state that the equation as shown on sheet 2 of the exhibit is the correct solution?

A. I am.

Q. And does the exhibit represent the application of ordinary mathematical principles to this particular problem?

A. Yes.

Mr. Mason: Have you any questions, Mr. Strouss?

Mr. Strouss: No questions.

Mr. Mason: Has your Honor any questions?

The Court: No.

Mr. Mason: We offer the exhibit in evidence as Exhibit No. 298.

Mr. Strouss: Objected to as irrelevant and immaterial, purely speculative, and building an inference on an inference.

[fol. 3853] The Court: Just one question the Court wants to ask before ruling on it. It seems to the Court that the exhibit as now presented, which, of course, is another way of attempting to get into evidence the matter excluded under Exhibit 221, we do have now under the actual col-

umn a summary of the actual operations for the two months June and August, 1938, and also a summary of the redispatched trains during that same period. Now, while this other is not in evidence, I am going to refer to it. I notice, Mr. Sines, that on the exhibit 221, which was rejected, that using the mathematics there employed, that you arrived at a net decrease in the number of meets and passes for the year as being 15,337, whereas now you reach a total of 16,512. Can you reconcile those two figures?

A. Yes. The first figure of 15,000 plus was obtained by applying this formula against 24 individual days chosen for each month over the year 1938.

Q. That is, the first and the fifteenth?

A. Yes.

Q. Now, as a matter of fact, however, on exhibit 221, when you came to the matter of the redispatch, trains were not actually redispatched except during the months of [fol. 3854] June and August?

A. That is all.

Mr. Mason: You simply applied in getting the redispatched trains a constant factor of reduction in exhibit 221 for identification?

A. Yes.

Q. Whereas, in Exhibit 298 for identification you have used the actual redispatch?

A. Taken the results of the redispatching study for the 61 days, then expanded that to an annual basis.

The Court: Well, I am going to overrule the objection and admit it in evidence for what it is worth.

(The document referred to was received in evidence, and marked "Defendant's Exhibit No. 298.")

Mr. Mason: I suggest, your Honor, that even if the redispatch portion of the exhibit were entirely disregarded, we would still have the showing as between June and August actually, which would indicate how meets and passes can and do fluctuate as actual operations increase or decrease, because June was a month of heavy traffic and August a month of light traffic. We would still have a substantial comparison whether or not the redispatch columns are considered at all.

[fol. 3855] The Court: Well, it is somewhat speculative.

Mr. Strouss: I think that is putting it mildly.

The Court: I was sure you would agree with me.

Mr. Mason: Mr. Sines, have you prepared a statement in one sheet bearing the title, "Redispatch Study, June and August, 1938, Extraterritorial Effect of Arizona Train Limit Law Between Arizona-New Mexico State Line and El Paso, Texas."?

A. I have.

Mr. Mason: We ask that this statement be marked No. 299 for identification.

The Court: It may be marked.

The Clerk: Defendant's Exhibit No. 299 for identification.

Mr. Mason: I wish you would refer, please, Mr. Sines, to Exhibit 253, and will you explain what change or difference, if any, there is between Exhibit 299 for identification and exhibit No. 253?

A. In Exhibit 253 the average cost per train-mile saved is based upon a figure appearing on Exhibit 252, which includes the saving of $397,515 per annum estimated to accrue to freight service and $10,884 estimated to accrue [fol. 3856] in passenger service should long-train operation be adopted. On exhibit 299 I have eliminated the $10,884 saving accruing to passenger service in computing the average saving per train-mile saved of 0.4988 dollars appearing at the bottom of exhibit 299.

Q. Now, in exhibit No. 299 for identification, you show the blank reference in the footnote at the bottom. Should that be filled in with reference to Exhibit 252?

A. 252, yes.

Q. As I understand you, all that you have done is to recompute the figure indicated on Exhibit 253, but eliminated all reference to the passenger train saving which is computed at $10,884 per year, as shown on exhibits 231 and 252?

A. That is right.

Q. So that the total figure on exhibit 299 for identification, as representing the monetary saving between the Arizona-New Mexico state line and El Paso, is based entirely upon freight train operations?

A. That is right.

The Court: That accounts for the difference between the total figures shown in line 5 of exhibit 253 of $78,293 as compared to the total shown in this exhibit 299 of [fol. 3857] $75,712?

A. Yes.

Q. It is that fractional percentage of 10,000 that would apply east of the Arizona-New Mexico line?

A. It is made up largely of that amount of passenger service east of the state line, but there was also a small amount of passenger service between Los Angeles and Yuma that became involved in the computation.

Mr. Mason: This merely eliminates entirely any distortion which might have occurred on that account?

A. Exactly.

Q. Has the exhibit been compared and checked, Mr. Sines?

A. It has.

Q. Are the computations correct, to the best of your knowledge and belief?

A. They are.

Mr. Mason: Have you any questions, Mr. Strouss?

Mr. Strouss: No.

Mr. Mason: Has your Honor any questions?

The Court: No.

Mr. Mason: We offer it in evidence as defendant's Exhibit No. 299.

[fol. 3858] Mr. Strouss: It is objected to as wholly irrelevant and immaterial.

The Court: Overrule the objection. It may be admitted.

(The document referred to was received in evidence and marked "Defendant's Exhibit No. 299.")

Mr. Mason: I think that closes our case, subject to cross-examination.

(Thereupon, the matter of the resumption of proceedings was discussed between Court and counsel off the record.)

The Court: Then, for the record, the Court will be at recess until February 17th at ten A. M., at which time the witnesses for the defendant required by the State for

cross-examination will be ordered to be present with whatever records may be necessary.

(Thereupon, the court stood at recess until Monday, February 17, 1941, at ten o'clock A. M.)

[fol. 3859] February 17, 1941, ten o'clock A. M.

Proceedings were resumed at this time as follows:

The Court: You may proceed, Mr. Strouss, with cross-examination of the defendant's witness.

Mr. Strouss: With respect to the cross-examination of Mr. Bruns, a witness from the Santa Fe, I told Mr. Sines during the last week that if we could stipulate to the putting in evidence of the timetables, the employees' timetables, covering divisions or territory covered by his testimony and the engine ratings over that territory, that it would not be necessary to bring him back, and we are going to do that. We have the timetables but not the engine ratings.

Mr. Mason: Albuquerque Division, No. 78, and the Arizona Division, No. 94, those two employees' timetables are already in evidence in connection with the testimony of Mr. Mahoney, but the Pecos——

Mr. Strouss: They are?

Mr. Mason: Yes, you remember when the New Mexico Division and these two divisions were put in evidence, but the Pecos Division, that table is not in evidence. However, if this has the engine ratings——

Mr. Strouss: It doesn't have the engine ratings.

[fol. 3860] Mr. Mason: I have asked Mr. Bruns to supply those engine ratings. They will probably be in our hands early this week; in any event, they will be supplied.

The Court: Do you want to offer these?

Mr. Strouss: Well, if the other two are in, there is no necessity of putting in——

Mr. Mason: Those are in.

Mr. Strouss: Then just the Pecos Division.

The Court: They may be admitted in evidence, the employees' timetable No. 68 of the Santa Fe, the Pecos Division.

(The document referred to was received in evidence and marked, "Plaintiff's Exhibit No. 300.")

W. H. KIRKBRIDE was recalled to the witness stand.

Mr. Strouss: I will ask that this be marked for identification.

The Clerk: Plaintiff's Exhibit No. 301 for identification.

Mr. Mason: May I see the exhibit?

(Mr. Strouss hands the exhibit to Mr. Mason.)

[fol. 3861] Cross-examination.

By Mr. Strouss:

Q. Mr. Kirkbride, I hand you plaintiff's Exhibit 301 for identification. That is a part of the profile map of the Southern Pacific Lines between Tucson and the New Mexico-Arizona line, is it not?

A. Yes, sir.

Q. That is a part of the records of the company, of the Southern Pacific Company?

A. It is.

Q. And truly portrays the matters set forth?

A. It does.

Mr. Strouss: We offer this in evidence.

The Court: Any objection?

Mr. Mason: I would like to ask the witness a question or two about it, to be sure I understand what it is.

Q. Mr. Kirkbride, the document you have had handed to you and which is marked for identification No. 301, is the profile of the line in the neighborhood of the stations of Curvo and Sibyl, is it, on the north line of the Tucson Division between Benson and Dragoon?

A. Yes, sir.

Q. In the vicinity of mile-post 1037 to 1041 approximately, [fol. 3862] is that correct?

A. That is correct.

Q. Now, does this show the condition of the line as it is today or as of what date?

A. It isn't necessarily correct with reference to the data that is shown on the lower portion of the profile; for instance, with reference to 90-pound rail and full tie-plated and rock ballast, that data is not necessarily correct, but the profile, the elevations and the mile-posts represent the railroad as constructed.

Mr. Strouss: And curves?

A. I don't know where these prints came from, that is, they may be old prints, not necessarily reflecting local line changes.

Mr. Strouss: Let me interrupt here just a minute. I asked for the profile of the lines of the Southern Pacific. If there is any contention they are changed, I ask for profiles up to date, and I ask to defer my cross-examination.

The Witness: These blueprint profiles are substantially correct, but they are not kept up for statistical purposes. As I have explained, with reference to the tie-plates and rock ballast and rail, we don't keep the data on these profiles, so that these profiles are relatively——

[fol. 3863] Mr. Strouss: (Interrupting) Well, I would ask of counsel, if there is going to be any contention that these are not up to date, if there is, I want them up to date.

Mr. Mason: Your Honor, as the witness has just explained, we don't undertake to keep the data of changes of rail or changes of ballast or track construction on these data. Now, as the witness has so explained, this does show the grades and other characteristics of the line in that respect, I assume substantially as of the present date, is that correct, Mr. Kirkbride?

A. Substantially so; but may I explain that in the laying of rail and in the ballasting we apply spirals to our curves and make slight alterations to the central angles and the degree of curvature. I may further explain that in the original construction of this railroad, some curves were laid without tapers, which may be explained as easement curves at the end of the main curve. Some of them were equipped with tapers. Our modern method of aligning curves is to apply spirals, and these spirals are always longer than the old original tapers and, furthermore, if a curve doesn't have in its original construction a taper, why, we apply a spiral to it.

[fol. 3864] Mr. Strouss:

Q. When you do that, don't you make a new profile map?
A. We keep records in our office, but I cannot say that this represents the latest record.

The Court: Where did that profile in your hand come from; what is it taken from?

A. It is one of many sheets that came out of my office but it does not necessarily reflect the changes that might have been made as I have just explained. It is basic construction profile, may I say that, that it is the basic construction profile.
